A. J. Gordon of the Los Angeles County farm bureau announced that a series of poultry demonstrations has been arranged, to be held at homes in different districts the first two weeks of February. Professor Dougherty announced that poultry institutes for Southern California will he held in Riverside the last week in May, and in Van Nuys and probahly also in San Diego County the following week.

Poultry Profits

According to figures given by Professor Dougherty, the 12 demonstration farms under the direction of the university are proving that there is a very satisfactory profit in poultry kept under proper conditions. On one farm 975 hens produced a labor income of over $4,000. On another 928 hens hrought in $1,059; on another 718 hens brought in $1,563; in a fourth the income from 969 hens was $2,046, and in another case 957 hens produced a labor income of $2,031. His averages showed that 24 farms with 2,900 hens averaged the egg farmer $1,244 yearly and that the hens on these farms laid an average of 143.7 eggs a year, the highest average for any farm heing 176 and the lowest 113. The sale of fertilizer is included in these reports, the manure from 1,000 hens bringing in from $23 to $28 monthly.

Will Handle Broilers

The organization has now perfected a plan by which it undertakes to handle broilers for its members. The producer receives 75 per cent of the market when the broilers are delivered and the other 25 per cent when they are sold. The profits are divided hetween the National Poultry Company, which handles the hirds, the Poultry Producers and the producer, the first receiving 45 per cent, the second 40 per cent and the producer 15 per cent. The producer is thus assured the market price and prohahly something more.

Directors for 1920

After a lively hour in precinct caucus and another lively discussion in open meeting the following directors were elected: Riverside County, J. M. Davison, Riverside; San Diego County, T. M. Hurley, Oceanside; Orange County, C. A. Walker, Anaheim; San Bernardino County, T. C Browning, Fontana; San Gabriel, F. R. Richardson; Van Nuys, B. R. Holloway; Gardena, M. A. Schofield; Pomona, C. J. Ross; Burbank, L. W Prewett. Representative of the state market director, Austin O. Martin.

CHICK RATION

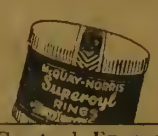
Although the little chicks are removed to the hrooder after 24 hours they are not fed for from 60 to 72 hours after hatch is completed. When the chick leaves the shell its digestive apparatus contains considerable unabsorbed yolk. Until this is digested the chick's delicate little stomach is not ready to receive other food When chicks are first taken to the brooder only a fountain of water is put before them. They will immediately begin picking at the sand on the floor and drinking water. This prepares and hardens the crop for other food. If buttermilk or sour milk is available, fountains of this may be given each morning and kept before the chicks all day, in addition to fountains of fresh water always before them. Where chicks are given all the sour milk they will drink, no meatscrap, etc., need be added to the chick mash. If only a small amount of milk can be fed, the meatscrap in mash may he reduced slightly, depending on amount of milk fed. If chicks drink the milk too eagerly and it physics them too much or causes sour crop, feed the milk in the morning only. Some flocks of chicks may overeat of milk and this should be prevented.

The time tried piston rings

For ten years these rings have stood the test—made good. And time is the severest test of any product. They are tried and true.

Genuine McQuay-Norris LEAK-PROOF Piston Rings, by creating uniform action on the cylinder walls, stop piston ring leakage, increase motor power, decrease carbon and save fuel and oil.

They are made in every size and over-size to fit every make and model of tractor, truck, passenger car or gasoline engine. Your dealer has them or can get proper sizes for you promptly from his jobber's complete stock.



To Control Excess Oil
A special ring for motors that pump oil. Use in top grooves of each piston. In the lower grooves use McQuay-Norris LEAK-PROOF Piston Rings for complete compression—power.

5

In feeding chicks the first two days, a grain mixture composed of equal parts by weight of fine cracked wheat, fine cracked corn and steel cut oats is fed in a wooden hopper and left before them all the time so that they can pick at the grains and thus learn how to eat. They will do a lot of picking at first but really swallow very little. As soon as they have learned how to eat, scatter the grains lightly on the sand for a day to teach them to scratch. Then put in a light litter of cut alfalfa or clover. From the time the litter is put in the chicks should be made to scratch for all their grain. Plenty of exercise keeps the system toned up and is the best preventive for the many ills to which little chicks are subject. Later on coarse cut straw can bo used instead of the cut clover or alfalfa, but for the first four weeks the latter is best, as the chicks will eat the finer parts and it will do them good. Pieces of straw would cause inflammation if taken into the crop at this tender time of the chick's life.

Beginning with the sixth day a dry mash composed of two pounds of bran, two pounds shorts, one pound cornmeal or barleymeal, two pounds beefscrap, one pound powdered bone, and three-tenths pound powdered charcoal is fed at 10 o'clock for one hour. For the next two weeks the litter is kept deep and grain mixture scattered in it early in the morning and about 3 o'clock in the afternoon with a feeding of dry mash at 10 a. m. As the chicks develop the dry mash should gradually be left before them for a longer interval, until by the time they are from eight to ten weeks old they have access to the mash till 2 p. m.

The chicks are gradually changed over from the chick grain to the laying grain mixture after they are five or six weeks old and big enough to begin to eat somewhat coarser grains.

First begin to eliminate the steel cut oats at about five weeks. Just as soon as chicks can handle larger grains substitute whole wheat or hulled barley and coarse cracked corn for fine cracked corn and wheat. At about ten weeks begin to add cracked barley. At five months rolled barley can be given and later whole barley. At six months the pullets should be eating the regular laying grain mixture. The laying mash may be substituted for chick mash at four or five months, and may be left before fowls at all times.

When wheat is hard to procure this division is using cracked, hulled barley in place of the cracked wheat in our chick grain mixture.

If pullets develop too rapidly, discontinue mash and substitute a hopper of dry bran at four to five months, and do not give the laying mash until six months of age. Too early laying is undesirable.

CONTROLLING POULTRY LICE

By J. R. Watson

The louse is one of the most annoying pests of poultry. It is a biting insect which feeds around the bases of the feathers, on scales and other refuse matter from the skin of the chicken, and should not be confused with the blood sucking mite. Unlike the mite, the chicken louse lives on the fowl constantly. It injures the chicken chiefly by irritation as it crawls over the skin. It is particularly injurious to young chickens unable to dust themselves thoroughly, and to the sitting hen which should not be forced to leave the nest for that purpose.

Even if the lousy hen does not desert the nest she is liable to become restless and break the eggs, or spend much of her time standing and chill them. Although more likely to become abundant on the sitting hen, chicken lice often become so annoying on laying hens as to reduce seriously the output of eggs.

Effective Remedies

Pyrethrum or Persian insect powder, an old, much used remedy, loses its effectiveness quickly when exposed to the air and much of it is of poor quality even when freshly bought. Perhaps the best powder to use as a dust is sodium fluoride. Its value for this purpose was first recognized by the bureau of entomology, United States department of agriculture. The powder has been tried by the writer and found effective. It may be used alone on the hen, or may be mixed with flour to lessen the amount required. Although rather expensive, about 50 cents a pound, the amount needed is so little that the cost per hen is small. The substance keeps well in a dry place, and a pound will answer the needs of a small flock for many months. Any surplus may be dusted into the corners of the pantry or cupboard to kill roaches and ants.

Sodium fluoride is most economically applied to fowls by the pinch method; that is, a pinch of the powder is dusted on the head, one under each wing, one on each thigh, one around the vent, one around the breast, and two on the back.

SEVERAL KINDS OF LICE AFFECT CHICKENS

Of the several kinds of lice that commonly attack chickens, one crawls over the skin, especially under the wings and on the posterior part of the body, but seldom gets onto the feathers. Another is particularly a feather mite and is somewhat smaller than the body louse. Another common louse that is particularly injurious to young chickens attacks the head and is called the head louse. It is best controlled perhaps by greasing the head liberally with lard.

Chicken mites, which are sucking parasites, may be killed by a liberal use of flowers of sulphur on the fowls and about the house. Stick-tight fleas also sucking pests, may be killed by a liberal application of one part of carbolic acid in five parts of vaseline.

The Pride of Petaluma

KRESKY'S 1920 VENTILATING brooder stove forces proper ventilation in spite of the operator and sweeps the room with FRESH AIR. PETALUMA'S latest sensation and result getter. TRY it. Keep it if you like it, or send it back if you do not.

GERMOZONE The Best Pet Stock Remedy

For Poultry, Pigeons, Dogs, Cats, Rabbits, Parrots, Canary and other birds or pet animals. Germozone is a universal and safe remedy; for colds, snuffles, roup, sore throat, loss of voice or singing, influenza, bowel trouble, distemper, sore eyes or ears, canker, gleet, loss of or feathers, sores, wounds, skin disease,—or other affections of skin or mucous membrane.

"My hens have never done so well as this year and haven't lost a single chick"—Mrs. Flora Kapple, Walker, Ia. "Simply grand for rabbits"—L. W. Browning, Boone, Ia. "Cannot praise Germozone enough. I use it for chickens, stock and household"—Mrs. Wm. Hoeppel, Hugo, Okla. "My bird pupples don't know what distemper is and I never had such good success before with chicks"—Curly Smith, Kennett, Mo.

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c and $1.50 packages from Omaha. Book on treatment of diseases free with each package.

PATRIOT

Built for Country Roads

Powerful Motor Trucks

In Washington, at the Walla Walla Farm Power Show, Patriot Trucks were the only rear-driven trucks that went over the hills in the plowed ground under capacity loads. Their performance was the talk of the Northwest and has resulted in the sale of hundreds of Patriot Trucks.

In California, the first load of wheat hauled to market in 1919 was hauled on a Washington Model Patriot Truck, hauling eight loads a day four miles and carrying 4½ tons of wheat each trip. The performance of that truck, handling almost 100% overload, made a great many friends for it in that community.

In Texas, Patriot Trucks are making a wonderful reputation for all-purpose hauling under all conditions—in the oil-fields of North Texas, the lumber districts of Eastern Texas, and the live stock and farm sections of West Texas.

In Kansas, a fleet of Patriot Trucks, heavily loaded, made a run of 350 miles last summer, through territory where there had been much rain for several weeks, some of the roads having practically no bottom—over 200 miles made in the rain—the entire trip of 350 miles being made in two days, each truck going through on its own power.

In Nebraska, Patriot Trucks were picked by the Standard Oil Co. for its roughest country work—where other trucks had fallen down.

All over America, Patriot Trucks are doing things. Ask us to tell you more about them.

The Reliable Blue Flame Wickless Oil Heated Hover

This Hover Represents Our 30-Inch 42-Inch and 52-Inch Sizes.

THE MODERN HOVER

This hover has the same chick capacity as the coal burning brooder. They are made in four sizes, 18 inch, 30 inch, 42 inch and 52 inch hover. A few of the special points on this oil heated hover are as follows:

Burns Coal Oil
Steady Blue Flame
Comfortable and Easy to Operate
Economy of Operation
No Wick to Trim
No Oil Fumes
Visible Oil Feed
Convenient and Safe
No Coal, Smoke or Gas
The Flow of Oil Is Regulated Automatically.
Abundance of Heat

NO longer is there any question about farm engine value. Long ago engine power made a secure place for itself on the good farmer's farm. Made itself the indispensable worker at a dozen or a score of small jobs we need not name here. You know them too well. They are a part of the routine of your life.

Nor need there be any question as to *which* engine power will serve you best for the longest time.

Tens of thousands of power users will tell you if they have the opportunity that the best answer is "International Kerosene Engine!" On the day you read these lines many new Internationals will start work for new owners. These engine investments are made on the strength of rugged Harvester reputation, kerosene economy, quality of materials and construction. And you will have the sureness of International service at your service whenever you may call for it.

The figures at the top are the sizes in which International engines are made. One or another of them will serve you. See the International dealer.

MIGRATORY BEEKEEPING

ONE of the features of the short course in commercial beekeeping, held at Davis, Fresno, Riverside and San Diego, was the talk by J. D. Bixby of Covina, which of course, was repeated at each point at which the meetings were held. Mr. Bixby has had much experience along this line, and his talk sums up the various lines of successful endeavor. "The development of our great system of paved roads, and of the auto-truck, has revolutionized beekeeping in this state and made possible many things undreamed of a decade ago," said this speaker, as reported by the Western Honey Bee.

"Today it is possible to take advantage of three or four honey flows in a season, even with an apiary running into hundreds of colonies. One may start with eucalyptus and willow in January and February, build the bees up to full strength and secure a small surplus yield, then move to the orange in March. By June 1 he is located in the purple or white sage belt, his early honey marketed, and the bees will be ready to move to the beans July 1 where the flow may continue lightly to September 1.

"Or one may have an apiary in the citrus belt, raise queens and divide each colony twice or thrice, taking a considerable crop of orange honey meanwhile, then move to the alfalfa and sweet clover ranges of Idaho and Utah just in time to catch their opening flow and make a full crop of honey.

"Many of our most successful beekeepers think it as important to move within reach of an abundant spring pollen as to follow the honey flow. Pollen makes young bees—honey does not, and the colony with few bees cannot store much surplus, no matter how plentiful the nectar. Especially must this factor be considered in dry winters. When we have early rains, filaree, bur clover and other 'grass flowers' come on early and furnish the necessary pollen, but after dry winters they are usually so late that they are of much less value. In the citrus sections, particularly, we are always short of pollen until the live oaks and wild walnuts bloom, usually at the opening of the orange flow.

"The season has much to do with success in migratory beekeeping. When early fall rains occur the black sage which furnishes the main crop is likely to be very early and be in blossom even earlier than the orange, or at least occur simultaneously. In such case moving from the sage to the orange is of doubtful expediency, while the reverse plan is useless unless one has the purple or white sage to rely on. In moving from the orange to the sage or from sage to beans, every effort must be made to save time, owing to this overlapping of the seasons. Screens and cleats must be ready, trucks and help engaged and all arrangements for locations made in advance.

"All experience seems to agree that in long moves by rail it is better to get rid of the old worker bees. They fret themselves to death, anyway, and the increased excitement caused by their worrying operates against the safety of the balance of the colony. A short move before closing up for shipment, or the division of the colonies, accomplished this result. Colonies are usually divided into four or five frame nuclei before long moves, anyway, the queenless ones to be requeened after arrival or divided again, depending on the season at the destination.

"It is quite possible to have colonies too strong for safe moving. In such cases they should be divided by setting one or two supers full of bees on a new bottom board, treating them as a separate colony and reuniting at the end of the trip. I knew one young beekeeper who destroyed 20 of his best colonies by neglecting this precaution; these colonies were so populous that three hive bodies would not safely accommodate the bees.

"One point to be guarded against is the tendency to abscond after the disturbance of a long journey. As many as ten per cent of your colonies may be so affected. The yard should be watched closely for a week or ten days after arrival and swarms thus leaving the hive be returned, placing an empty super below the broodnest. They may be hived, when discovered clustered, in the same manner, placing a frame of brood, all sealed, no eggs or larvae, in the upper story as bait."

Own a "SELECTED" Farm In Western Canada
—Make Bigger Profits!

The most wonderful opportunity in the world for Business Farmers is in the "SELECTED" Farms, which can be bought for $15 to $40 an acre along the lines of the Canadian National Railways in Western Canada.

"SELECTED" Farms

These "SELECTED" Farms are carefully chosen from the cream of the richest wheat and cattle country in America, to meet your special needs, by experts representing 14,000 miles of railway, whose advice, while free to settlers, is of great practical value.

A Cordial Welcome

Western Canada extends a helpful hand to homeseekers. Friendly neighbors — splendid schools, churches and social life — warm, sunny, growing summers and dry, cold, healthy winters—await you in this wonderfully prosperous "LAST WEST."

Big Profits in Wheat, Dairying, Beef and Dairy Cattle

"SELECTED" Farms average more than 20 bushels of wheat per acre. Under specially favorable conditions a yield of 50 to 60 bushels per acre is not uncommon.

Dairying is exceptionally profitable. That soil and climate are well adapted to it is shown in greatly increased production and high quality maintained. A world-wide market awaits all that Western Canada can produce.

Beef and dairy cattle yield great profits. Stock thrive on the prairie grasses, which in many sections cure standing and make fine hay. Cattle and horses require only natural shelter most of the winter and bring high prices without grain feeding.

Low Taxes—Easy Terms

There is a small tax on the land, but buildings, improvements, animals, machinery and personal property are all tax exempt. Terms on "SELECTED" Farms: About 10 per cent cash down, balance in equal payments over a term of years; interest *usually* 6 per cent.

Special Rates to Homeseekers

Special railway rates will be made for homeseekers and their effects to encourage personal inspection of the "SELECTED" Farms along the lines of the Canadian National Railways. Full information will be sent on request. WRITE OR MAIL COUPON TODAY!

Household Department

THE FIRST AMERICAN

Such was he, our martyr chief,
Whom late the nation he had led,
With ashes on her head,
Wept with the passion of an angry grief:
Forgive me, if from present things I turn
To speak what in my heart will beat and burn,
And hang my wreath on his world honored urn.
Nature, they say, doth dote,
And cannot make a man
Save on some wornout plan,
Repeating us by rote:
For him her old world moulds aside she threw,
And, choosing sweet clay from the the breast
Of the unexhausted West,
With stuff untainted shaped a hero new,
Wise, steadfast in the strength of God, and true.
How beautiful to see
Once more a shepherd of mankind indeed,
Who loved his charge, but never loved to lead;
One whose meek flock the people joyed to be,
Not lured by any cheat of birth,
But his his clear-grained human worth,
And brave old wisdom of sincerity!
They knew that outward grace is dust;
They could not choose but trust
In that sure-footed mind's unfaltering skill,
And supple-tempered will
That bent like perfect steel to spring and thrust.
His was no lonely mountain-peak of mind,
Thrusting to thin air o'er our cloudy bars,
A sea-mark now, now lost in vapor's blind.
Broad prairie rather, genial, level-lined,
Fruitful and friendly for all human kind,
Yet also nigh to heaven and loved of loftiest stars.
Nothing of Europe here,
Or, then, of Europe fronting mornward still,
Ere any names of serf and peer
Could nature's equal scheme deface
And thwart her genial will;
Here was a type of the true elder race,
And one of Plutarch's men talked with us face to face.
I praise him not; it were too late;
And some innative weaknes there must be
In him who condescends to victory
Such as the present gives, and cannot wait,
Safe in himself as in a fate.
So always firmly he:
He knew to bide his time,
And can his fame abide,
Still patient in his simple faith sublime,
Till the wise years decide.
Great captains, with their guns and drums,
Disturb our judgment for the hour,
But at last silence comes;
These all are gone, and, standing like a tower,
Our children shall behold his fame,
The kindly-earnest, brave, foreseeing man,
Sagacious, patient, dreading praise, not blame,
New birth of our new soil, the first American.

—James Russell Lowell.

ABE LINKUM'S BIRFDAY

ABRAHAM LINCOLN LEE was the only grandchild of his white headed, golden hearted, black faced grandmother, and lived in the city of Albany where there were thousands of white children and only a very few black ones.

His grandmother did fine washing and ironing, and Abe Linkum ran errands for her and took the dainty clothes home when she was through with them. He was a very useful little black boy and loved his granny very much.

"But I don' like dis yere town, granny," he said to her one day. "Hit's so lonesome whar dey ain't no yether little black chillun 'sides me."

"Nev' min' honey," she said, "if we all ever does fin' Lil' Missy ev'thing's gwine'r be alright. You run along now an' take dese yere clo's home fer granny."

Abe Linkum took the neat package of laundry and started to find the address his grandmother gave him. These directions led him to a pretty little two story house set back from the street in a friendly garden. He went to the side door, where granny had told him parcels must be delivered, and when he knocked a very pleasant and very pretty young lady opened the door and took his package. Then while he waited for his pay she did a very queer thing. She began talking into the wall by the door where he stood. He didn't see anyone around, so of course he knew she must be talking to him.

That was why he said to her, "Thank you, lady, an' I'll be shore to come and bring my granny."

She looked at him as if she didn't quite understand what he meant but of course he knew she did, for this is what she had said, "Yes, tomorrow is Abraham Lincoln's birthday and we have a half holiday—we are going to have a program in the morning and holiday in the afternoon, so please bring your grandmother and come over and help us celebrate."

Abe Linkum didn't know just what a "program" was but, "Hit mought be some kin'r new cake," he said to himself, and anyhow he surely knew that his name was Abe Linkum and that tomorrow was his birthday.

What he didn't know was that the pretty young lady was a teacher talking over the telephone to a friend, and inviting her to come and bring her grandmother to spend the holiday afternoon. And of course she was saying that they were going to celebrate Abraham Lincoln's birthday, at school, but poor little black Abe Linkum didn't know that. He was very young and he didn't know anything about the great man whose name he bore — he was named for his own father and he didn't know anything about his name back of that.

And that was why the next afternoon they came to the side door of the pretty home in the friendly garden and knocked — he and his kind old grandmother, dressed in their best and smiling all over their good black faces.

The truly invited friend and her grandmother were there, too, and when Abe Linkum's grandmother saw the friend's grandmother she forgot her manners and opened out her kind old arms as wide as she could to spread them around the slim shoulders of the other grandmother.

"Lawd bless my soul! Lil' Missy," she said, laughing and crying at the same time, "an' glory be ter His name, I'se done foun' you an' now we all can depart in peace! I knowed long ago you'd moved to dis yere town but I ain' knowed yer married name an' I ain' knowed jes how I'se gwine's fin' you, but I'se sho' prayed fer de comin' er dis day fer I'se got ter tell yer dat ole Marse William Churchill's will done be'n foun' an' when we all goes back to Virginny—you an' me an' Lil' Honey dar, an' Lil' ole Abe Linkum here, we all's gwine'r be de richest folks in de state. But what I wants ter know, Lil' Missy, is how come you all fer to know dat dis yere was dat chile's birfday."

Then the pretty young lady remembered it all, and understood and explained and then they all laughed and laughed, except Abe Linkum Lee, who had his mouth too full of "some kin'r new cake." — By Francis McKinnon Morton.

TO HELP BEAT H. C. L.

By Mrs. E. V.

Having noticed the call in your paper to help beat the H. C. L., I will give you a few items concerning economy that I have learned as a mother and household manager, hoping they will help someone else.

Now when materials are so expensive we need to take the best of care of clothes on hand by seeing that all spots are removed from woolen and silk garments. A very reliable method is to use turpentine. Saturate a clean cloth and apply it to all tar or grease spots and it will remove them when gasoline fails to do so. It will also remove chewing gum. If the garment is not otherwise clean, dip it in a basin of gasoline, and it will come out clean as new. To take the place of apron gingham, also underclothes in warm weather, you can buy sugar sacks at the grocery and large flour sacks at the city bakery for a small sum, and after taking out the lettering and washing clean you can color those you wish to use for aprons, and I believe you will be pleased with them for such a small outlay. Also old cotton dress skirts, shortened for underskirts, wear a long time and thus save new ones.

Then let us remember the "stitch in time" by mending hosiery and sometimes cutting new feet for the ever present supply of good legs. These feet should be made of good

CALUMET GRIDDLE CAKES — golden yellow, coated with toasty brown, light and tender. No other griddle cakes can be so delicious — for the one reason that no other baking powder is so good.

CALUMET Baking Powder

Makes Most Palatable and Sweetest of Foods

It is absolutely dependable. It is always the same—always superior—always sure.

Its uniformity of quality — its powerful, unfailing strength, guarantee greatest baking success and savings.

You save when you buy it—moderate in cost.

You save when you use it—has more than the ordinary leavening strength—therefore you use less.

You save materials it is used with.

Produced in the biggest, most modern and sanitary baking powder factory in existence.

Contains only such ingredients as have been officially approved by U. S. Food Authorities.

Try it! Then you'll quit looking for something better — because you will know from results — from comparison — that CALUMET has no equal in quality or in economy.

One can will convince you.

Order today!

Send 10 cents in silver or stamps for our up to date Spring and Summer, 1920, CATALOGUE, containing 550 designs of Ladies', Misses' and Children's Patterns, a CONCISE AND COMPREHENSIVE ARTICLE ON DRESSMAKING, ALSO SOME POINTS FOR THE NEEDLE (illustrating 30 of the various, simple stitches) all valuable hints to the home dressmaker.

BE SURE TO SEND SIZE

3077-3078. A Pleasing Costume. Waist 3077 cut in eight sizes: 34, 36, 38, 40, 42, 44, 46 and 48 inches bust measure. Skirt 3078 cut in seven sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. For a medium size, 5¾ yards of 44 inch material will be required for the entire costume. The width of skirt at lower edge is about 1⅞ yard. Two separate patterns 10 cents for each pattern.

3081. Girls' Dress. Cut in 4 sizes: 8, 10, 12 and 14 years. Size 12 requires 3¾ yards of 44 inch material. Price, 10 cents.

3072. Ladies' Apron. Cut in 4 sizes: Small, Medium, Large and Extra Large. Size Medium requires 3½ yards of 36 inch material. Price, 10 cents.

3066. Childs' Rompers. Cut in 4 sizes: 2, 3, 4 and 5 years. Size 4 requires 2¾ yards of 36 inch material. Price, 10 cents.

3070. Ladies' Dress. Cut in 7 sizes: 34, 36, 40, 42, 44 and 46 inches bust measure. Size 38 requires 6 yards of 44 inch material. The width of dress at lower edge is 1¾ yard. Price, 10 cents.

2706. Girls' Dress. Cut in 3 sizes: 12, 14 and 16 years. Size 14 will require 4½ yards of 36-inch material. Price, 10 cents.

2760. Ladies' House Dress. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 requires 6 yards of 36 inch material. The dress measures about 2¼ yards at the foot. Price, 10 cents.

3075. Childs' Dress. Cut in 5 sizes: 1, 2, 3, 4 and 5 years. Size 4 requires 2⅜ yards of 36 inch material. Price, 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest Chicago styles, all pattern orders are filled in Chicago. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

Mayer

HONORBILT SHOES

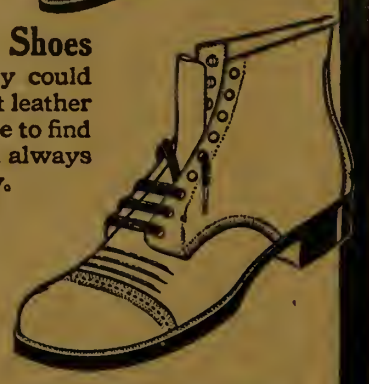
MILWAUKEE Mayer TRADE-MARK CUSTOM MADE HONORBILT

For the Whole Family

DRESS up shoes for everybody, work shoes, school shoes for the children and easy restful house shoes. *Honorbilt* Shoes contain the same good quality leathers they did 38 years ago; they are *built on honor*. The name *Honorbilt* stands for a heaping measure of service. Wear a pair and prove it for yourself.

Men's and Women's Fine Shoes

The fine shoes are all that anybody could ask for in style and you get choicest leather plus genuine comfort. You are sure to find the particular shape you want and always the latest styles, and a wide variety.



Work Shoes

Honorbilt Work Shoe leather is double tanned to resist the alkali in the soil, as well as barnyard juices. They are soft and easy on the feet yet long wearing and will not get hard when wet. Honorbilt Work Shoes will give double the wear of ordinary shoes.

Children's Shoes

Sturdy, well-built shoes that stand rough treatment—the kind boys and girls like, and their parents, too. Shaped for growing feet. The quality is there—*they wear like iron.*

No matter who in your family needs a pair of shoes next, see your dealer who handles the Mayer Honorbilt line. Look for the name *Honorbilt* on the soles.

durable cloth. Some of your friends possibly have a good pattern.

In such ways we can save the price of some much needed new garment, and good material is always cheapest in the end. Yours for economy.

CUTTING SOME OF THE CORNERS

By A. E. W., Redondo

Here is the way I cut some of the corners in dressmaking.

I had a black and white crepe house dress, too short and too narrow for the prevailing season, so I took an old black skirt that had seen its best and second best days, and found enough good in it to lengthen the sleeves and skirt of the crepe, put in a black panel front, collar and belt, making a better looking dress than it was when new.

I also had a black satin skirt, worn out just above the knees in front. I did not know what to do, so I went to the scrap bag and found some strips of satin. Of this I made folds and put on two fashionable pockets and made the skirt good for some time.

Then I wanted a blouse like 3089, so I went to the grocery store and bought a sugar sack for 15 cents. I dyed it lavender and embroidered it in the fashionable heavy embroidery, and there was another dress.

Then I got a remnant of gingham—blue, tan and white—but not enough to make a dress without getting more for a band around the bottom and collar and cuffs and belt. I thought perhaps I could find another remnant, but could not, so I took an old blue dress that was quite worn and too faded to use. On the wrong side it just matched the blue in the new gingham. So I ripped it up and turned it wrong side out and used it, and with some large pearl buttons I had before the WAR I made quite a pretty new dress.

INEXPENSIVE HOUSE DRESSES

By Mrs. L. P. Miller, Brawley.

When gingham, calico and percale soared so high in price, I was puzzled to know how I could beat the H. C. of L. in the clothing sector until the thought came to me that I could use flour sacks and Diamond dye and have pretty dark inexpensive house dresses and aprons yet.

I buy 100 pound flour sacks at the bakery for 15 cents each, dust the flour from them well, cut and make them into dresses, smocks, middies and aprons before they are laundered. Then on wash day the garment goes in with the week's wash and after drying in the sun the print will most always have disappeared.

Then I buy a package of Diamond dye for each garment to be colored, of the color I like, and dye it in the wash boiler on the oil stove, some morning while I do the dishes, and it's so easy if one follows directions carefully. I wish you could see my pretty lavender dress I am wearing now, with belt and sailor collar. It is made from four sacks. It's pretty and I am proud of it. Middies and aprons are worn white and when bleached look like linen. One sack makes a good kitchen apron with band; three sacks make two large bib aprons, and they are so easily laundered. Try this plan. I'm sure you will like it.

WARDROBE NOTES

By Martha

Any girl can dress well on a small income if she has learned to be neat and careful with her clothes. Neglected clothing is never attractive, no matter how expensive the material or how stylish the make.

The best way to care for separate waists is to hang them over the back of a chair until thoroughly aired, then place over a coat hanger and hang up in the closet. They keep their shape and freshness much longer when cared for in this way than when folded and laid away in a drawer. Veils, ribbons and laces can be kept smooth and fresh looking by smoothing out after each wearing and winding over a roller. Kid gloves should be blown up by the breath immediately after stripping from the hand, then filled with a light shake of glove powder and laid away without folding, and not palm to palm, but separately between folds of tissue paper.

To polish fine shoes, kid gloves and leather hand bags, the white of an egg mixed with good black ink and applied with a soft cloth is excellent.

White laces and white silk shawls may be cleaned by sprinkling thoroughly with an equal mixture of borax and flour, rolling them closely in a white cloth and allowing them to remain a few days. To clean white angora hoods and furs, put them in a small flour sack and sprinkle plenty of this mixture over them, then squeeze between the hands and rub lightly between the hands, shake and brush until all powder is removed. To clean ostrich feathers add a cup of cornmeal to the mixture, put feathers into a paper bag, cover with this and shake until the soil has disappeared.

To give dainty laces, fine white waists and sheer white collars just the right degree of stiffness, wash as usual but do not starch. When dry, dissolve one tablespoon of borax in one quart of warm water. Dip the pieces in this, wring out and fold in a towel for a few hours, then iron dry. They will not get mussed nearly as much as when starch is used and they are much easier to iron. To whiten goods that has turned yellow, soak in sour buttermilk for two or three days, then wash as usual and dry in the sunshine.

GOOD APRONS

By Mrs. R. A. Odell, Tulare

I found a way to beat H. C. of L. and cut the corners in aprons. As ginghams are so expensive, I looked about to cut the expense. Well, I found it in grain sacks. I took two of them. Those made by machine rip easily. I took up darts at the waist, sewed on a large hook and eye, put an inch wide hem at the sides and bottoms, added a large patch pocket for gloves, etc. I had two aprons now. One I hooked at the back and the other in front. They completely cover my skirt, and if it is raining keep it dry. They are fine to wear in the garden also. They save much washing and ironing, also wear on gingham aprons. One can leave them at the kitchen door and go into the house clean. No extra cost, only a little time and thread.

Hoping this will help some other chicken woman as much as it has me I am—A Subscriber.

USE FOR WORNOUT SHIRTS

Mrs. Paul Waddell, Sacramento

I have been taking the Cultivator for a year and on reading it this evening I see where you offer to send it a year to every one sending in a suggestion. I would like to say that clothes are so expensive that I find good use for my husband's and son's wornout shirts. I make children's aprons and skirts, also small aprons for myself out of the front and back, as they are most always good. Then I tear the sleeves in strips and sew together for a carpet. I have a very nice carpet I made that way It will surprise you to see how soon you get enough for a carpet, besides other things to wear, from old shirts.

I like your paper very much and look for its coming every week, as it has so many helpful things to do about the house.

USING SACKS

The expense of muslins for underwear for both children and adults may be greatly reduced if you will buy the egg food sacks from poultrymen. Wash and bleach them and you have a yard of muslin for less than one-third what the same material would cost in stores. The material is heavy and wears well. It may also be dyed and used for children's rompers. The large flour sacks, which you may purchase reasonably at any baker's, may also be used advantageously for children's underwear or may be dyed a pale blue or pink and used for comforter linings.—Subscriber, Escondido Valley.

SUBSTANTIAL DRESSES

For house dresses there is nothing quite equal to Danish cloth. It lasts as long as three ordinary dresses, launders equal to the best of wash materials, never fades, requires no starch, so the ironing is negligible. With a very generous supply of white collars, made from any white material, one always looks neat and presentable.—Cultivator Reader.

CUTTING H. C. OF L.

By Mrs. F. I.

Cutting the H. C. of L. is one of our chief sports these days. In the matter of clothes the place to begin is with the pattern. Consider the kind of garment first. Suppose it is a house dress. There is a good pattern that is cut to fall straight from the shoulders with set in sleeves (and the sleeves are very important for comfort and looks). Do not use kimono sleeves, as they make the garment "creep up." A plain straight belt which buttons or snaps in front may be used, but just now sashes are popular for house dresses. The sash should be fastened at the front and tied in a bow at the back. Collar, cuffs and sash may be edged with rickrack.

By careful selection of material and merely changing shape of the collar and pockets, all the house dresses may be made from the same pattern, and it can also be used to cut nightgowns.

As to material, why pay 40 cents a yard for percale of doubtful wearing quality when you can get devonshire that will wear two or three times as long for 50 or 60 cents? It takes only three and one-half yards for this house dress in the medium size. By fastening the sash just below the bust line you have a comfortable and attractive dress for maternity wear.

Underwear, if made at home, should always be of good material. It does not pay to put in your time sewing cloth that will not hold together. Never buy long cloth or nainsook in less than ten yard lengths. There is so much advantage in cutting a number of garments from a large piece. Such goods never go out of style. Watch the January and June white sales for bargains in these. If you buy your underwear ready made, lay in a supply during these same white sales. You can figure out about how many gowns and petticoats, etc., you will need for six months.

Shoes and stockings are my worst problem. I can make everything else that I wear except corsets, and those I often get at a sale—discontinued models. I buy a corset because it suits my figure and my purse and not because it is the newest thing out. Good lisle stockings are far better than poor silk ones. Shoes that fit and wear well are not cheap, but the other kind are more expensive in the long run. Have more than one pair at a time if you possibly can and never do housework in your dress shoes. It will ruin them as quickly as it would your best dress. Often a pair of shoes that have apparently gone to seed may be freshened and given another start by having the heels built up and giving them a "professional shine"; don't just black them. And last, but not least, wear rubbers when you need them, for the sake of your shoes if not for your health. Keep shoe trees in them when they are not on your feet.

And now for street clothes. Is it necessary to warn the woman of limited means to avoid extreme styles as she would a plague? I am wearing a five year old hat which has not been out of style since I got it. It was hand made to begin with and of excellent material, and black. I have changed the trimming each season. It has never had but one piece of trimming at a time. Of course I am tired of it and hope there will not have to be a sixth year for it. Look until you find the shape that suits your face and your general style and then wear it even if it is small when everyone else is wearing them large.

As a general rule coat and dresses are more serviceable for the woman at home than is the suit and blouse. A good coat, if carefully chosen, will last at least three years, and dresses may be made at home. A suit is extremely hard to make at home and goes out of style much sooner than a coat.

It is a wise woman who doesn't get stung in a "cheap" store. Do not be afraid of the fine big stores. They carry no shoddy merchandise. You will be more sure of getting your money's worth at any time, and when they do have a sale you can expect real bargains!

Also, it pays to shop around. And use your ingenuity. The prettiest bedroom curtains I ever had were made of unbleached muslin (at 25 cents a yard), with blue birds worked in cross stitch here and there—not more than three or four on each curtain. I can boil them and they never fade. Did you ever see a cretonne that could be treated like that?

"CUTTING CORNERS"

By Mrs. J. O. Heletman, Willows

Dark voiles or lawns, self trimmed, are practical as well as simple and pretty for summer dresses. In buying select shades that blend well together so that the same hat, gloves, petticoat can be worn with all your gowns.

Gertrude slips for grown ups as well as chidren look well under all dresses. Make of plain colored ginghams or chambray or crepe and save laundry. To make: Baste hem on right side of skirt; cut in scallops; baste and sew scallops by machine; turn over and sew hem in place on wrong side of skirt. This finish saves trimming and looks well and outwears the slip.

In buying for children select good materials. Small plaids, checks or stripes in two or three tones are most practical. Buy several dresses off one piece of material—one can vary the dresses in style and trimming. I have bloomers to match. A wash hat of the same adds distinction to a simple garment.

Blue or brown denim makes good kitchen aprons and wears well. One or one and one-fourth yards of material cut with bib and apron in one, loop of tape around neck to hold bib in place and tape for strings.

I buy small remnants of cloth and make my small boy the little rabbit pants. They can be worn with white or colored waists or outgrown rompers.

TWO GOOD SALAD DRESSINGS

By Irma M. Landon, Watsonville

I am interested in your household department and always read that part of the paper first. The recipes and suggestions are very helpful. I am sending you a couple of recipes for salad and salad dressing.

"Dream" Fruit Salad

Twenty-four marshmallows, one can pineapple, two juicy apples, six oranges, lettuce leaves.

Dressing—One tablespoon Crisco, pinch salt, two tablespoons sugar, two tablespoons vinegar, two eggs, one-half pint whipped cream.

Directions—Cut the fruit and marshmallows into small pieces, then mix and chill.

For dressing, beat up the eggs in a double boiler, add vinegar, sugar, salt, Crisco, and cook until thick. Cool and add the whipped cream. Mix with the fruit and serve on a crisp lettuce leaf. This dressing is delicious, too, with bananas and apples.

A "last minute" salad dressing: Three tablespoons sugar, little mustard, pinch of salt, vinegar to taste. This dressing is good served on any kind of fruit.

IT STUCK TO THE ERASER

The teacher had written 92.7 on the blackboard, and to show the effect of multiplying by ten rubbed out the decimal point. She then turned to the class and said:

"Now, Mary, where is the decimal point?"

"On the duster, miss," Mary replied without hesitation.—Edinburgh Scotsman.

ADMIRATION

"Did you grasp the significance of that lecturer's remarks?"

"Not altogether."

"Then why did you applaud so much?"

"Well, I admire brains and I thought that man must be awful smart to understand what he was talking about."

TOO RISKY

"How would you like to live always on a farm and do chores and milk the cows, and everything?" mother asked little Emily.

"Oh, wonderful," was the quick response, "but I'm quite sure I could never get enough courage to sit under a bossy and milk, they have so many legs and their tails are so restless."—Hoard's Dairyman.

Such things as come to the man who waits are seldom the things he has been waiting for.—Implement Record.

A Good Piano Is an Investment Not an Expense

When a person buys a Piano that person is making an investment that carries a higher earning rate than for any other single thing that could be bought for the home. Good music rests the brain, helps the body to relax, melts away the memory of annoyances that arose during the day, tunes up the spirit and makes one more fit to do bigger and better things. It provides hundreds of little mental vacations during the year—and we all admit that vacations are good investments.

Many a good idea has clicked in the mind of successful people, as they listened to the inspiring music of the Piano—these ideas often have been turned into cash.

When company calls and conversation lags the Piano has proved a ready source of entertainment—it is paying back a part of the purchase price.

A good Piano will last a life time. The upkeep is negligible. Dependable Pianos come in a wide range of prices. We have a Piano to fit every purse and gladly arrange convenient payment terms. You say you can't play the Piano—nonsense—in this age we have the Player Piano which anybody can play. Remember buying a Piano is not an expense but is an investment which pays good dividends—will pay for itself many times over.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

Dealers in Steinway and Other Pianos, Pianola and Duo Art Pianos, Aeolian Player Pianos, Player Rolls, Etc.

The Return of Agricultural Gypsum

By U. S. Eaton, University of Chicago

IN science, especially agricultural science, our line of progress seems often to be an advancing spiral. The present revival of the use of gypsum as a fertilizer illustrates the point. There is no more interesting story in applied science than the discovery, early use, decline and now the revival of the use of gypsum as a fertilizer. Let us sketch some of the main points of this story.

Gypsum is a ground natural rock fertilizer composed mainly of calcium sulphate. It therefore contains two of the ten essential elements for plant nutrition—calcium and sulphur. Its value in promoting plant growth was independently discovered in France and Germany, in Germany in the year 1768 and somewhat earlier in France. In France some workmen in alabaster (gypsum) noticed that where they dusted their clothes the grasses (clovers) showed very much greater growth. They rightly attributed this to the gypsum. A monk gave it a practical trial. Its use spread over France and Germany. It was introduced into this country from France, Benjamin Franklin being one of the first to introduce it.

The farmers of this early period included some of the most prominent and able men of the time and in testing out gypsum as a fertilizer they carried on experiments that should be regarded by agriculturists today as legitimate fertility experiments. There are two prominent figures in these early investigations, John Binns and Judge Peters. Peters emphasized the use of gypsum in connection with green or stable manure. Using it in this way he succeeded in bringing worn out land to a high state of fertility. Red clover was especially benefited though it was beneficial also to flax, hemp, rape and other farm crops. Binn's account of the use of gypsum in London County reads almost like a fairy tale. He speaks of the doubling of the corn yield and the increase in the wheat yield three to four fold. The number and size of the stack was greatly increased. Threshing was delayed due to the increased yields and the grannaries and mills of the county were glutted. From what we know now in regard to how sulphur acts as a fertilizer it is probable that this increased yield in the non-legumes was due to greater growth of the legumes of the rotation.

From this country the use of gypsum was introduced into England. Here too it was used with success. Smithe in 1808 reported the following increased yields: Sainfoin 45 per cent, cow grass, 14 per cent, Dutch clover, 33 per cent, red clover 237 per cent. The value of the seed was increased 330 per cent, red clover 237 per cent. per cent for red clover. The cereals were not benefited. Like results by other investigators have been reporteded.

The use of gypsum as a fertilizer gradually declined. Perhaps the main reason for this was the invention of acid phosphate by Lawes in 1842 and the subsequent introduction and wide advertising of complete soluble fertilizers. But a thing that prolonged this period of decline and that gave general credence to the belief, which many of the later investigators held, that gypsum acted merely as a stimulant, was a misconception of the sulphur requirements of plants. This was due to the method of sulphur determination in use during this period. The sulphur was determined in the ash and we now know that during the ashing a large per cent of the sulphur is lost.

New extract methods of analysis have shown that crops contain much more sulphur than was at first supposed. In fact the average farm crops contain almost as much sulphur as phosphorus, and aside from nitrogen, phosphorus has been considered the main limiting factor to crop production. Most cultivated soils contain less sulphur than phosphorus, in some soils must less, as in certain Oregon soils where the ratio is 4:1. Add to this the facts that soils lose much more sulphur than phosphorus through drainage and that they lose much more sulphur in this way than is brought down by the rain and we begin to realize that the sulphur problem may be quite as serious as the phosphorus problem.

It is this realization that is causing a remarkable revival of fertilization by gypsum and other forms of sulphur.

For Market Reports
See Pages 214 and 215

Up to date perhaps there has been more work done on the analysis of crops and soils for sulphur than on sulphur fertility experiments. But there have been a number of experiments on the use of sulphur as a fertilizer. The most significant results have been obtained in Oregon and Washington. Here they are getting increased tonnage yields of legumes (clover, alfalfa, vetch) amounting to 25 to 1,000 per cent. They get these increases too with various forms of sulphur (iron sulphate, gypsum, flowers of sulphur and acid phosphate) but the use of gypsum as a top dressing is emphasized for alfalfa especially. The per cent of protein in the crop is also increased. With such an increase in the tonnage yields of the naturally protein rich legumes and also a further increase in the percentage protein content of the crop our gain in protein and nitrogen is almost incredible. And these are the most expensive animal and plant foods respectively. We are getting this gain too at a small cost, for gypsum is a cheap fertilizer.

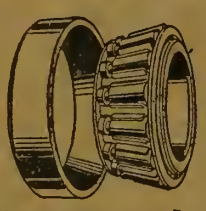
We have stated that gypsum is a natural rock fertilizer. We are fast returning to a raw rock system of fertility. Before 1850 the raw rock fertilizers, gypsum and marls, were, aside from manures, the most common fertilizers. The chief fault in this system was probably the lack of phosphorus. Today raw rock phosphates and lime are coming to be used quite commonly. But this system bids fair to fall because of lack of another plant food—sulphur. With the return of gypsum, however, we can supply this element. A logical system of soil fertility now is raw rock phosphate, gypsum, lime and potassium where needed, and the supplying of nitrogen by the growth of legumes.

Raw rock fertilizers are cheap per unit of plant food. They are slightly soluble, but by applying them in large quantities we can be sure of always having a sufficient supply of plant food in the soil. Soluble fertilizers are high priced per unit of plant food. They act quickly and they are applied therefore in small amounts.

HIGH COST OF LIVING, SHOES AND CLOTHING, NOT FOOD SAY FARMERS

Registering a vigorous protest against the high cost of living being charged to the farmer, the committee on the present milk situation of the Los Angeles County Farm Bureau in rendering its report to that body at the monthly meeting held January 15, brought out the fact that a survey of food prices shows an increase of only six per cent from January 1, 1919 to

Do You Know—



STANDARD PRACTICE

The use of Timken Tapered Roller Bearings at points of hard service in the great majority of motor vehicles is proof of leadership established on the tapered principle of design, quality of manufacture, performance on the road, and service to the automotive industry.

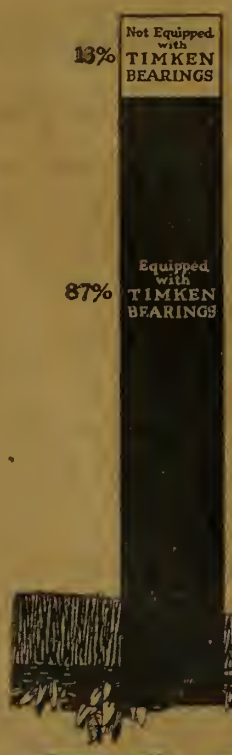
that out of 148 leading makes of trucks, 129, or 87%, are equipped with Timken Roller Bearings at points of hard service?

that Timken Roller Bearings were first installed in the motor truck in 1905?

that more than 15 years of hardest service tests have proved Timken Tapered Roller Bearings absolutely right in principle and manufacture?

that the Timken Bearing is practically the only part now used in motor truck construction that has never needed to be redesigned, that is used in its original form?

that the Timken Tapered Roller type of Bearing is the only type that will function properly under radial load or thrust load, and all possible combinations of the two?



THE TIMKEN ROLLER BEARING CO.
Canton, Ohio

Timken Tapered Roller Bearings for Passenger Cars, Trucks, Tractors, Farm Implements, Machinery, and Industrial Appliances.

TIMKEN BEARINGS

January 1, 1920, whereas everybody realizes the cost of living has risen from 20 to 25 per cent.

President J. B. Vaile in discussing the report said: "To charge the farmer with being responsible for the present high cost of living is a serious misstatement of the facts, and to blame the high cost of living on the increased food prices is simply obscuration. The fact is that housing, clothing, professional services, traveling, entertaining and everything else that goes to make up living, has increased in price considerably more than has food. There is an evident intent on the part of certain interests to throw the burden of this high cost of living on the food producer, ignoring the fact that the farmer has to live just as other people do. He has to pay the increased costs of housing, clothing, doctoring service, traveling, entertaining and everything else. Even should he produce all that his family needs to eat, he would still only escape six per cent increased cost as compared to the at least 25 per cent increase in cost of living due to other causes."

With special reference to the milk situation the statement was made that the present boycotts on the use of milk and eggs agitated in certain of our larger cities if it accomplishes anything whatever will make these products scarcer in the future and add to the present increased cost of living. Government figures show that compared to prices last year at this time milk is but slightly higher and eggs are cheaper. With the increased cost of labor and all other factors going into these two businesses it simply means that egg producers and dairymen are working on a narrower margin than ever before. As a matter of fact, compared to other food products, the two really cheap sources of food at the present time are milk and dairy products and beef. The boycotters are making two serious mistakes; first they are endangering an adequate supply of two important foodstuffs; and second, they are discouraging the two classes of food producers most easily led to leave their business.

AMERICAN DIET CHANGING

Whether it is because of the increased cost of meat or because people's tastes have changed, the fact remains that Americans are eating eight per cent less meat than they were 20 years ago. This is disclosed in a recent dietary survey made by the United States department of agriculture.

In this survey 2,000 dietary records, each covering a period of seven days, were collected from 1,425 families and 575 institutions in 46 states. Sixteen nationalities and many occupations and incomes were represented, as were also both urban and rural localities.

From a summary of 500 of these family records it appears that last year the average cost of food per man per day was 46 cents, with an average return in food value of 3,225 calories, 96 grams protein, 118 grams fat, and 405 grams carbohydrate. These figures are in fairly close accord with the dietary standards ordinarily used in discussing such problems of general nutrition.

A comparison of the food stuffs purchased by the 500 families with the amounts of the same food purchased by 400 families about 20 years ago shows that the amount of meat in the American diet has decreased about eight per cent, and the amount of grain products about 11 per cent. People are eating more milk, butter and cheese than they were two decades ago, for the amount of dairy products consumed has increased about six per cent. Four per cent more vegetables and eight per cent more fruit is being eaten now.

Some individual food habits undoubtedly need to be corrected, but judging by these studies it seems fair to conclude that the average diet seems to be adequate.

PROVED IT

A youthful aspirant for journalistic distinction, who was asked to write an article on superstition and imbecility began his essay thus:

"That imbecility is not on the wane, perusal of the following lines will amply demonstrate—Dallas News.

Nothing is so local as not to be of some general benefit.

To avoid confusion, the J. I. CASE THRESHING MACHINE COMPANY desires to have it known that it is not now and never has been interested in, or in any way connected or affiliated with the J. I. Case Plow Works, or the Wallis Tractor Company, or the J. I. Case Plow Works Co.

The Case Line Offers Choice of Required Power and Capacity

KEROSENE TRACTORS

The Case 10-18 Tractor drives 20 x 28 Thresher with Windstacker, Feeder and Grain Handler; No. 12 Case Silo Filler with 40-ft. blower pipe; 17 x 22 Hay Baler; will pull 2-bottom plow, 6 to 8 inches deep, depending on soil and field conditions; 8 ft. double-action Disc Harrow; 22 shoe Grain Drill; two 6 ft. Binders.

The Case 10-20 Tractor drives 22 x 36 Thresher and full equipment; pulls 3-bottom plow, under favorable conditions; other machinery requiring similar power.

The Case 15-27 Tractor drives 26 x 46 Thresher with Feeder and Windstacker; three 14 in. plows in hard plowing, or four under favorable conditions; 10 ft. double-action Disc Harrow; two 7 ft. Binders, etc.

The Case 22-40 Tractor drives 32 x 54 Thresher with Windstacker, Feeder and Grain Handler; No. 20 Case Silo Filler with 40 ft. blower pipe; four 14 in. plows in hard ground, or five under favorable conditions; battery of Grain Drills or Harrows.

The Case 20-40 Tractor will handle belt and drawbar jobs similar to 22-40.

The J. I. Case Threshing Machine Company also builds:

- Grand Detour Plows, all sizes and for all soils and conditions.
- Double Disc Harrows for use with tractors.
- Threshing Machines,—six sizes
- Hay Balers,—two sizes
- Silo Fillers,—three sizes
- Road Graders,—three sizes
- Steam Tractors,—eight sizes
- Rock Crushers,—two sizes
- Steam Road Rollers,—two sizes

Booklets, describing and illustrating any products above mentioned, furnished on request.

How is this Year Different from Past Years in the History of Motor Transportation

YOU men who have watched the development of the automobile industry from the beginning remember how it used to be five or six years ago.

Some manufacturer announced a production of 5,000 cars for the coming year and everybody pitied him.

Registrations had already reached three millions.

* * *

The short sighted dealer shook his head and said it couldn't last.

He hurried to get his orders in and his cars out before it was too late.

Everything hinged on quick deliveries.

It is different today.

With nearly 8,000,000 registration ahead for the year 1920, we see the industry still in its infancy.

There can be no point of saturation short of the transportation needs of the country.

* * *

What are the transportation needs of America — passenger and freight — and when will they be met?

That is a question our children's grandchildren will still be asking.

So, with motor vehicles as with tires, there will be no limit to the demand for the most fit.

For example—today there is no scarcity of tires. You see no cars laid up for want of tires.

There *is* a scarcity of U. S. Tires.

* * *

This company with its enormous stake—the largest in the industry — is taking the long view—the sound, constructive view.

We are building and equipping for greater capacity, but placing responsibility for quality above the temptation of forced production. When we have doubled and trebled our facilities, there will still be a scarcity of U. S. Tires.

and LIVESTOCK and DAIRY JOURNAL

Los Angeles — An Illustrated Weekly for the Rural Home and Ranch — San Francisco

Vol. LIV — February 14, 1920 — No. 7

Survey of the Livestock Situation

THE ranges, the hillsides, and the valleys are going dry. We are all crying for rain. Every producer in the state is suffering, perhaps most of all the livestock man. At least, the livestock man most quickly feels the pinch, So he is not only scanning the heavens, hoping for some sign which shall promise rain, but he is looking over market conditions and production conditions to learn as to best future steps. And while figures are ordinarily considered as dry as California's weather has been for the past few months, they are wonderfully enlightenening to the careful reader. Dollars and cents often depend upon these tables and the construction put upon the statements they make, so at this moment there is much of interest in the table shown on this page which is compiled by Messrs. J. E. Rickards and E. E. Kaufman, field agents of the bureau of crop estimates, U. S. D. A.

The parallel columns of state and national statistics give opportunity to make intelligent comparison. One point is peculiar; horses have lowered in valuation during the past five years, while mules have advanced. Dairy cows have advanced somewhat in worth, but in numbers the increase in the five years has been very slight. However, here is the comment made by Messrs. Rickard and Kaufman:

		United States		California	
		Number	Price	Number	Price
Horses	1920	21,109,000	$94.39	400,000	$94.00
	1919	21,534,000	98.45	435,000	91.00
	1918	21,482,000	104.24	468,000	99.00
	1917	21,210,000	102.89	468,000	97.00
	1916	21,159,000	101.60	493,000	96.00
Mules	1920	4,995,000	147.10	59,000	122.00
	1919	4,954,000	135.83	63,000	125.00
	1918	4,873,000	128.81	66,000	115.00
	1917	4,723,000	118.15	70,000	116.00
	1916	4,593,000	113.83	70,000	110.00
Milch Cows	1920	23,747,000	85.13	571,000	97.00
	1919	23,475,000	78.20	561,000	79.00
	1918	23,310,000	70.54	597,000	72.50
	1917	22,894,000	59.63	591,000	67.00
	1916	22,108,000	53.92	568,000	69.00
Other Cattle	1920	44,385,000	43.14	1,634,000	51.40
	1919	45,085,000	44.22	1,650,000	48.20
	1918	44,112,000	40.88	1,701,000	42.10
	1917	41,689,000	35.92	1,636,000	38.10
	1916	39,812,000	33.53	1,558,000	36.30
Sheep	1920	48,615,000	10.52	2,972,000	10.80
	1919	48,866,000	11.63	2,943,000	12.00
	1918	48,603,000	11.82	2,776,000	11.30
	1917	47,616,000	7.13	2,524,000	6.70
	1916	48,625,000	5.17	2,450,000	5.00
Swine	1920	72,909,000	19.01	973,000	18.00
	1919	74,584,000	22.02	1,003,000	18.00
	1918	70,978,000	19.54	974,000	17.50
	1917	67,503,000	11.75	994,000	10.10
	1916	67,766,000	8.40	947,000	8.40

The winter of 1918-19 was favorable to the stockmen, and stock returned from the summer ranges in fair to good condition of flesh. The absence of the usual late fall and winter rains has brought about more or less serious conditions in many counties, and considerable apprehension is now apparent as to the immediate future. Stock will go on to the summer ranges and pastures weakened in vitality and with losses probably above the average. The outlook is more or less discouraging, particularly to the cattlemen.

HORSES—The Census Bureau counted 469,000 horses of all ages in 1910. A gradual increase in numbers was noted until 1915, since then the decrease has been rapid, a drop from 503,000 that year to 400,000 January, 1920.

MULES—The number of mules in California has never been large, and followed the same trend as horses—slowly increasing to a maximum of 74,000 in 1915 followed by a more rapid decline to the present number.

MILK COWS—From 467,000 milk cows counted by the census in 1910, a regular increase in number was noted for about eight years when high feed costs with a depleted supply of high priced labor caused a sudden slump in the total number. The present year, however, indicates an upward turn again.

The State Department of Agriculture reports for the year ending September 30, 1919, the production of 62,449,000 pounds of butter and 11,600,000 pounds of cheese compared to 60,399,000 pounds of butter and 9,796,000 pounds of cheese for the previous year.

OTHER CATTLE — Only one per cent decrease in the number of cattle other than milk cows compared with one year ago is disclosed by reports from regular correspondents, cattlemen and others. The total number, 1,634,000 compared to 1,608,000 in 1910, indicates only 1.6 per cent increase in ten years.

"Join the California Cattlemen's Association" is a good slogan for the cattle grower as it means greater cooperation in breeding, ranging and marketing problems, all of which tends toward an increase in numbers, better times for the cattlemen and cheaper beef for the consumer.

SHEEP — From 2,417,000 sheep in 1910 the number has jumped to 2,972,000 in 1920. Present conditions seem a little more favorable to the wool grower than to the cattle grower, but there has been more or less shifting of flocks on account of feed.

Unquestionably every owner of sheep can help himself and the industry by becoming a member of the California Wool Growers Association.

SWINE—About 27 per cent more swine in California than ten years ago, or 767,000 head in 1910 as compared with 973,000 in 1920, is indicated by the count of pig's noses on January 1. This is three per cent less than one year ago. Prices obtained by producers the past season were somewhat less, while feed costs were higher.

FISK TIRES

THIS YEAR—for excess mileage, buy Fisk. For any make of car, buy Fisk. For double-generous size, buy Fisk. For real service—dollar for dollar and mile for mile—buy Fisk!

Fisk Tires live up to the Fisk ideal—"To be the best concern in the world to work for, and the squarest concern in existence to do business with."

Top Working the Walnut Orchard

By Ernest Braunton

A DEMONSTRATION and lecture on top working, the walnut was given at the Whittier state school orchard on January 30. The lecture was by Dr. L. D. Batchelor, professor of plant breeding, state college of agriculture, while the work of grafting was done by D. C. Wiley of the California Walnut Growers Asociation. The subject chosen was a northern black walnut ten years old, though it was stated the process was precisely the same for any native American species, or variety of the English or Persian nut.

The so-called northern black nut is the same as the one growing in the south except that it grows much larger, more erect, is deeper rooted and longer lived. It is not native to the northern sections where it grows and is found in a wild state in but two zones in the lower Sacramento Valley where it was taken by Indians before the advent of the white man. Between these stations and the southern range where it is widely distributed is a large zone without a single specimen, reaching from Contra Costa County, where but six trees are found, down to the Ojai Valley in Ventura County. From the latter point it is common to the Santiago Canyon in Orange County, its southernmost range. It is not advisable to use the southern nut for stock for the reasons given, but particularly because it is short lived.

The Lecture

Dr. Batchelor said: "Do not approach the task of top-working the walnut with any fear of results. Any man, woman or half grown child may do the work after being shown how. The purpose of the work is to put scions of the better or desired varieties into seedlings bearing poor nuts, blank nuts (meatless), or those bearing crops so small as to be unprofitable. The only remedy is to re-top. One wishing to try out new varieties at once will also find this the most expeditious solution."

Dr. Batchelor then called attention to several top-worked trees to illustrate the rate of growth of the new tops. These tops were from two to four years old. Among them were an Erhardt of four years growth, a Eureka, a Rutherford and several others named for the owner of the orchard or tree from which the scions were taken, often non-commercial varieties. Some of these new tops had borne five pounds of nuts the sec-

(Continued on Page 249).

At the Demonstration

Above is Mr. Weinshank, a pioneer in the production of walnut trees. He is holding in his hand a piece of walnut wood to represent a young seedling stock on which has been placed a scion of desirable variety, by the regular whip graft.

Below, native black which has been grafted to Eureka. Note large stakes or supports which have been spiked to the tree and to which the scions as they have started to grow have been tied for support.

The Grafting Operation

The native black tree from which the top has just been cut. The split has just been made in the short stub in the center. The angular wedge has been driven in to spread the split apart for insertion of the scion which is being prepared with a sharp knife in the hands of the operator. D. C. Wiley, who did the practical work in the demonstration.

Tools and Methods

Upper photo shows tools and appliances necessary. In the box beside the pruning shears are the scions preserved in moist shavings. Leaning against the tree is the large saw which should not be too coarse but fine enough to make fairly smooth cut. The large cleaver-like knife at left end of tool box is used for splitting the stub of the old tree, the mallet being used for this purpose. Next to the knife are a couple of wedges. These are ordinary blacksmith made, bent at right angle to facilitate prying open of the split for insertion of scion. Between the wedges and the mallet is a sharp knife for the careful work of cutting the scions. The two pruning saws at right end of the box are for emergency work under conditions where large saw would not operate. At the right of the picture is an ordinary five gallon oil can with top and part of one side cut out. Inside may be seen ordinary wick oil stove. The side opening is for draft and for access to the burner. In case of wind the "door" to the heater may be closed. The kettle of grafting wax is shown between the heater and the tool box.

Middle picture shows Mr. Wiley at work; also Prof. L. D. Batchelor of the Riverside experiment station, making a particular point as to methods of work.

Lower picture shows Prof. Batchelor opening the demonstration with general statement of benefits and the ease with which an orchard may be made over. The tree in the foreground is a California black which was grafted three years ago to Erhardt.

Agricultural News Notes of the Pacific Coast

Northern California

The Sacramento farm bureau is conducting a campaign for increased membership.

A plan is on foot for organizing a cooperative organization to dry and market California wine grapes.

Shasta County is making plans for its county fair. J. M. Moore of Inwood is chairman of the fair committee.

The price of jute bags has been fixed by the prison directors at San Quentin at 15 cents in lots of 10,000 or less.

Potato growers say that the high price of their product is due to shortage of the crop, not to manipulation of the market.

A great hoard of onions is reported to have been found by federal authorities in San Francisco, held in storage since last September.

A very successful farm bureau auction sale was held at Lincoln, Placer County, January 24. The crowd was large and bidding spirited.

Contracts are reported to have been made for more than 10,000 tons of wine grapes in the Napa Valley. These are to be dried before shipping.

The Chico chamber of commerce will have a rice inspection department that will make it possible for growers to get cash payments before shipping.

The Sacramento and Yolo County farm bureaus are discussing the advisability of joining in the organization of a marketing department to sell products cooperatively.

Report has been made from Butte County that several sheep have died from eating rice stubble. Dr. Hays of the veterinary department of the state university is investigating.

Ladybugs will no longer be transported free on the railroads for distribution to aphis infested fields as was the custom before the railroads were taken over by the government.

State Dairy Inspector Asseistine has just completed an inspection of dairies of the Chico district of Butte County. Scores of dairies in perfection of equipment range from 50 to 88 per cent.

Shasta County farm bureau meetings: Inwood, February 14; Cottonwood, 16; Bella Vista, 18; Stillwater, 20; directors meeting, 21; Whitmore, 24 p. m.; Palo Cedro, 25; Hat Creek, 27; Fall River, 28; Round Mountain, 29.

The California Prune & Apricot Growers Association has had orchard signs made for member growers. These will be placed at the entrance to the grove and read: "This is a Sunsweet Orchard."

As a result of its successful campaign for membership the California Prune and Apricot Growers is sending out notice that it will immediately take up all options on the growers' crop of the 1920-21 season.

Farm bureau meetings in Tehama County during February: Anteiope, 10; Dairyville, 11; Oak Park, 13; Richfield, 16; Corning, 19; Bend, 20; Los Molinos, 23; Proberta, 25; Directors meeting at Red Bluff, 10:30 A. M., 20.

Surveyor General W. S. Kingsbury will hold a public auction sale of scrip in the senate chamber at the state capitol, Sacramento, on Monday, March 1, 1920, at 10 a. m. At the last auction sale of scrip the average price received per acre was $9.82.

Central California

Tulare is shipping eggs to Chicago.

Dairymen of the Salinas Valley met at Gonzales, January 23.

In the egg laying contest at Santa Cruz only White Leghorn hens are entered.

Watsonville fruit growers are asking for a more rigid state inspection of the apple pack.

Large shipments of seed sweet potatoes are being sent out from Turlock, Stanislaus County.

The Visalia Growers Association is planning the erection of a $175,000 cannery at Visalia.

It is expected that cotton planting in the San Joaquin Valley this year will double last year's.

Forty-two new members were initiated last week in the Turlock Cooperative Union of America.

Fumigation of grapes for mealybug prevention is being conducted in vineyards of Dinuba, Tulare County.

It is estimated that about 6,000 acres will be planted to cantaloupes in the Turlock section this season.

Reports come to Portervilie that recent rains in the Sierra have been of distinct help to the stock ranges.

The Tulare County Poland China Breeders association held its second consignment sale at Tulare February 6.

The Pacific Fruit Express Company announces that it is building 4,000 new refrigerator cars to handle California fruit this season.

The farm bureau of Lindsay, Tulare County, is in the midst of a membership drive. Plans are being made for a big get-together meeting February 26.

At the annual meeting of the Atwater Fruit Exchange it was announced that 157 cars of deciduous fresh fruit has been shipped under its direction.

Max J. Crow of Gilroy, has purchased a 50 acre tract near Oakdale, Stanislaus County, where he will establish a nursery specializing in figs, almonds and raisin grapes.

Fairmead and Dixieland, Madera County, farm bureau members have organized the Fairmead Farmers Cooperation Association and will open a general mercantile store in Fairmead.

The Associated Raisin Company is planning the erection soon of a packing house in Tulare. The association wishes to be assured of a 15,000 acre planting to raisin grapes before beginning its erection.

Watsonville apple packers are protesting over the condemnation of their fruit. They assert that it is packed and shipped in perfect condition and then allowed to stand and decay in warehouses in the Bay cities.

W. J. Sinclair of Fairmead is the owner of the cow which topped the list of butter fat producers in the January test of the Madera-Merced County cow testing division of the farm bureau. Her record for 30 days was 78.4 pounds fat.

Sugar beet farmers of the Salinas Valley will confer with the Spreckels Company in regard to having a representative of the farmers at the factory to look after their interests in the weighing of beets, testing, ascertaining dirt percentages and other matters of similar nature.

Southern California

A cotton gin is to be built at Perris, Riverside County.

The experiment station at Meloland has a number of date palms for free distribution.

Beekeepers of Orange County met at Orange last Monday to discuss the foul brood situation.

The coming citrus crop of San Bernardino County is estimated at 7,145 cars oranges, 1,085 cars lemons.

The almond crop of Banning, San Bernardino County, was short last year, amounting to only 175 tons.

A home department center of the farm bureau of Highland, San Bernardino County, was formed last week.

Fourteen hundred acres of almond trees are in bloom in the Banning district of San Bernardino County.

At a recent meeting in Los Angeles there was formed the Los Angeles County Reforestation Association.

The farm bureau of Ontario, San Bernardino County, will plant 150,000 eucalyptus trees to serve as windbreaks.

Citrus institute will be held at San Bernardino during the National Orange Show. Institute dates, February 20-21.

Redlands is somewhat disturbed over the amount of heavy trucking on its streets which increases expense of road upkeep.

Hemet, Riverside County, expects to ship out a normal crop of oranges; Valencias are about two weeks earlier than usual.

The citrus experiment station at Riverside is putting up a fight to save the lives of the two parent navel trees at Riverside.

Manager Sandilands of the Anaheim Orange and Lemon Association estimates that Anaheim will have 150 cars more of oranges this year than last.

The Poultry Producers Association of Southern California held their annual meeting at Los Angeles, last week. Three hundred members were present.

The State Beekeepers Association met last week in Los Angeles at Exposition park. The work of the National Beekeepers Association was reported on.

Thousands of acres of land are to be leased from Indians on the Parker reservation. Many leases have been taken by cotton growers of Palo Verde, Riverside County.

The Poultry Producers Association of San Diego County at its recent meeting at Escondido appointed Tom Hurley of Bonsall representative in the state association.

Cotton Expert W. P. Camp of the United States department of agriculture has been visiting fields near Perris, Riverside County, where it is proposed to plant cotton the coming season.

The California Fruit Growers Association is discussing advisability of establishing at Riverside another cooperative cannery. This association already has canneries at Elsinore, Hemet, Fallbrook and Ontario.

The Automobile Club of Southern California is complaining to Orange County supervisors that farmers are plowing up too much land along sides of roads making it necessary for them to turn out on the highway itself and so hold up traffic.

The Coast and General

Another cotton gin is being established at Somerton, Arizona.

The creamery at Albany, Oregon, paid 74 cents for December butter fat.

Oklahoma has passed a law permitting farmers to organize cooperative buying associations.

Whatcom County, Washington, has a cow testing association with membership of 1,200 dairy cows.

The Oregon Horse and Cattle Raising Association will meet in annual convention at Burns, May 20, 21.

The Washington State Wool Growers Association held its annual convention at Walla Walla last week.

The new Hood River-Mosier section of the Columbia River highway will be formally opened the last of this month.

The Guernsey breeders of Whatcom County, Washington, have organized an association.

The agricultural college at Pullman, Washington, is giving a two weeks' course in the handling of farm engines.

A big camp for cotton pickers is being built at Chandler, Arizona. The camp will accommodate between 400 and 500 Mexicans.

One of the banks of Eugene, Oregon, has purchased two carloads of pure bred Holsteins to be sold to the farmers of Lane County.

Portland, Oregon, will hold a corn show and will maintain the exhibit for 60 days. One thousand dollars in cash prizes will be offered.

The postoffice service reports that rural mail carriers are quitting at the rate of 50 a day because they can get better pay as farm laborers.

At the recent convention of National Wool Growers held in Salt Lake City, M. J. Powers of Flagstaff, Arizona, was elected vice president.

A large crushed fruit and juice factory will be established in Sheridan, Oregon. This will be the fourth establishment of this kind located in Sheridan this year.

State Mine Inspector J. H. Bolin announces that Arizona mines produced last year minerals valued at $108,707,000. The value of copper was $98,000,000 for 1919.

Water users under the Salt River Canal of Arizona have asked the board of governors to discontinue the use of pumped water pending the receipt of analysis of the water from the state university.

The Washington State Beekeepers Association met in annual convention at Seattle, January 22-24, and took an important step in making plans for cooperative selling of honey. Owners of 3,600 colonies signed up.

Long staple Egyptian cotton, such as is grown in the Salt and Yuma Valleys of Arizona, has increased to more than four times its selling price of four years ago. At that time the price was around 20 cents and now it has held steady at slightly about 80 cents a pound for many weeks.

An attempt is being made to form a national farm loan association among land owners under the Salt River Valley project of Arizona. Under the present law farm loans cannot be made under the national act on land within government projects. Forming an association here is the first step towards making a change in the present law.

Shorthorn Type That Counts

By Frank D. Tomson, Editor The Shorthorn in America

THERE is a difference between owning cattle and being in the cattle business, a difference between a cattle producer and a cattle improver. There is a difference in the profits—gauged by the character of the animals produced.

Herewith are presented a few rough sketches suggestive of different types. I have not attempted to be painfully accurate in making these drawings, but they will serve to show the difference in types.

Figure I

Figure I shows the head of a bull inclined to coarseness and plainness. It will be noted that the face is entirely too long. A head of this character is often found on a bull of more than ordinary size, usually lacking in smoothness and inclined to be flat sided. One does not travel far without observing in the pastures bulls with heads like this.

Figure II

Figure II shows a bull calf of apparent ruggedness. The head is quite satisfactory in conformation, but it will be noted that too much "leather" is below the jaw. This in itself is a suggestion of coarseness. It is a characteristic that is found more frequently in a breed other than Shorthorn, but it appears too often in our own herds.

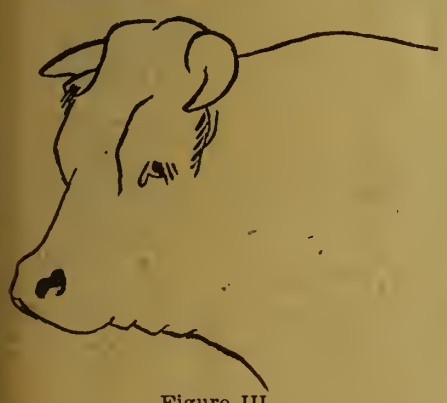

Figure III

Figure III shows a typical Shorthorn head of clean, attractive character, possibly too mild in its expression, but otherwise quite free from criticism. The horns are well turned, the face sufficiently broad and well dished.

Figure IV is quite similar in conformation, but reveals more alertness and energy, suggestive of prepotency. It will be noted that the nostril is wide and open—a condition that is desired, furnishing an ample intake for fresh air. The eye is large and sufficiently prominent, indicative of virility and good health. The neck is full and well rounded, the crest well proportioned. One would expect to

Figure IV

find a bull possessing a head of this character to be an impressive sire. This peculiarly clean cut head, strong but quiet expression, is characteristic of the Shorthorn.

Figure V

Figure V shows a head that might be expected to adorn a good feeder. Note the width of the muzzle, the large nostril, the broad face, the width between the eyes and the base of the horns. This head denotes the feeder rather than the sire. It lacks something in assertiveness and impressive masculinity.

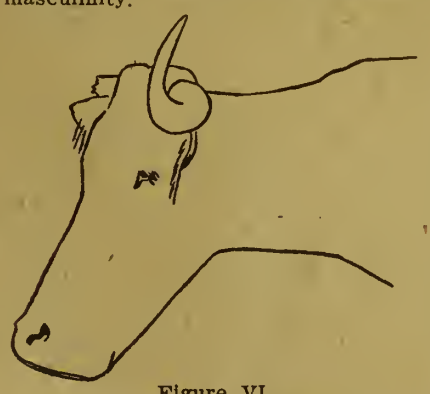

Figure VI

Figure VI is of a different type, illustrating the sort to avoid. Yet in those sections where bovine improvement has not been carried on to any great extent such heads as this are frequently seen on the cows that roam the woods or feed along the roadsides. There is a lack of good breeding clearly evident in the conformation and expression of this head. Note the distance between the eye and the nostril and the general indifferent, unresponsive expression as suggested by the outline.

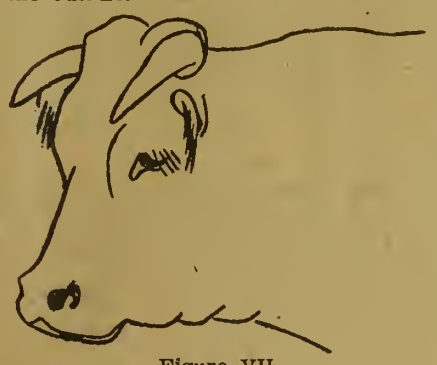

Figure VII

Figure VII approaches the ideal in the head of a Shorthorn female. Note its clean, refined, almost classy appearance, its sweetness of expression. Note here the large nostril and the full, expressive eye, the shapely horn, the graceful lines and the well set neck. One would expect a cow possessing a head like this to be of pleasing conformation and a responsive breeder. It is significant that those who study deeply the problems of bovine improvement attach great importance to the character of the bovine head as indicative of the dependability of the animal as a producer.

Figure VIII

Figure VIII shows the body outline of a Shorthorn cow approaching the ideal. Note the levelness of the back, the well rounded, well set quarters, the depth of body throughout and the large, well formed udder. Combine a body like this and the head as shown in Figure VII and little is left to be desired in the making of a Shorthorn

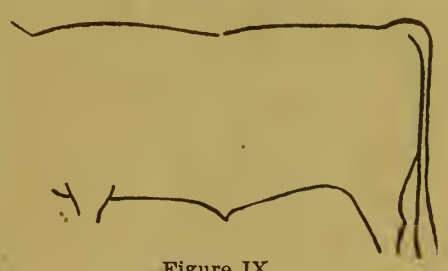

Figure IX

matron. With an outline such as this, one usually finds a well distributed and liberal flesh covering; the shoulders are usually well laid and the hips well covered. Note the graceful set of the tailhead. One thing to keep in mind in the selection of a brood cow or herd bull is ample depth of body such as is illustrated in Figure VIII.

Figure IX shows a bad top line. The neck does not join smoothly to the shoulder and there is an unsightly break in the back, and the tail-head

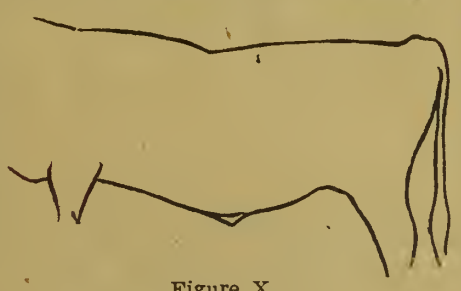

Figure X

is rough and high. These are three faults that the beef buyer at the markets objects to and cuts the price in harmony with his prejudice against them. The overwhelming majority of beef animals sold at the markets is inspected and purchased by men on horseback and these defects along the top line, as shown in Figure IX are quickly discernible and establish a bad impression with the purchaser. It should be remembered, too, that the highest priced cuts are found along the upper one-third of the carcass and defects appearing in that region are the more objectionable and costly on that account.

Figure X shows a similar top line, and in addition both the front and rear flanks are cut too high and the quarter is spare—"cat hammed." There is not a feature shown in this outline that appeals to the favor of anyone familiar with correct bovine form.

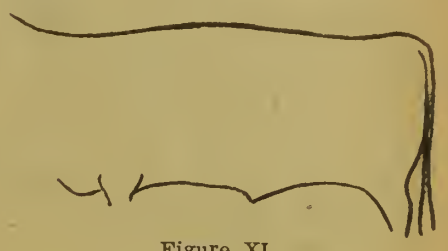

Figure XI

Figure XI shows the top line inclined to bow up too much and the tail-head is also a trifle high. As a rule, when the top line is "humped" as in this case, the under line is apt to show a similar tendency. The appearance is not pleasing and it is advisable in the selection of breeding animals to avoid this peculiarity.

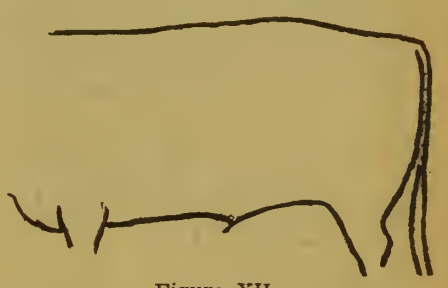

Figure XII

Figure XII illustrates the drooping rump—a characteristic that is found more generally among cattle imported from the British Isles. It appears that the Scotch and British breeders have not developed the prejudice against this peculiarity that exists in this country. Its chief objection is its lack of beauty.

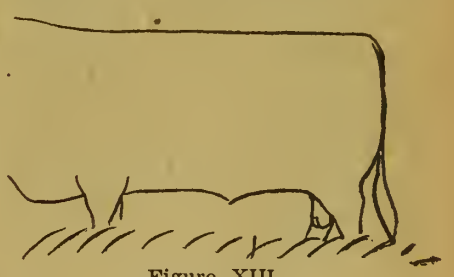

Figure XIII

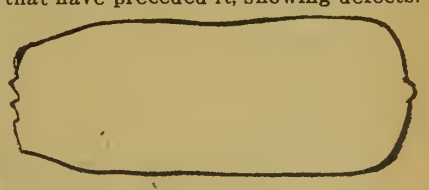
Figure XIII approaches the ideal conformation for the Shorthorn bull. Note that the top and bottom lines run level; that the quarters are well proportioned and properly set; that the tail-head is perfect and that the neck joins the body in pleasing lines. Contrast this outline with the several that have preceded it, showing defects.



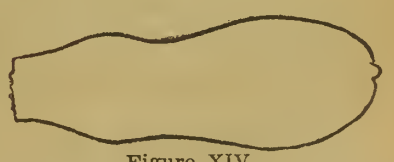


Figure XIV

Figure XIV shows a view looking downward over the backs. The one shows uneven side lines with flat foreribs as indicated by the in-curves back

(Continued on Page 257).

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

REGISTERING AUTOS

Automobiles are being registered in California at the rate of 18,000 daily.

Where do they all get them?

BARLEY

California's barley output for 1920 will total a million tons—drouth permitting. This will be 100,000 tons more than in 1918. This is according to estimates now being made by growers.

TRACTORS

A member of the California Tractor and Implement Association estimates that there are now operating in California at least 15,000 tractors.

The "world do move," especially when these 15,000 tractors get in action. It has been claimed that these tractors have displaced 150,000 horses and mules.

FARM POWER

The province of Quebec, including nearly a third of Canada, is promoting a campaign to increase power farming. A definite campaign of education is being systematically carried on by scores of agricultural experts, newspapers, farm papers, county agents and even the clergy to secure more power from farm power. The campaign is made necessary by labor shortage as acute in Qubec as it is in the United States.

NEW CHIEF OF MARKETS

The vacancy made some time ago by the resignation of Charles J. Brand, has been filled by the appointment to the office of George Livingston, formerly instructor in farm crops, Iowa state college of agriculture and later connected with the Ohio experiment station. Mr. Livingston has, however, been connected with the department of agriculture since 1915 as a marketing specialist.

NEXT WEEK

So many good things are in hand for this week's Cultivator that it has been necessary to hold over several for the next issue. Note Mr. Westcott's interesting short account of the dehydration and evaporation convention at San Jose. A longer discussion on "Important Dried Fruit insects in California," by E. O. Essig will be given next week. It will be illustrated, is intensely interesting and should be profitable to dried fruit producers and handlers. Further report of the convention will also be given. The article on Herefords with several illustrations, given in part this week, is continued. "Poultry in Our Orchards," an article written from a San Joaquin Valley standpoint, will be of interest to believers in diversified farming. The grape grower will find general discussion of pruning written by Prof. F. Flosfeder of the University of California. Jas DeCamp will write "Keeping the Move in Your Motor." Irrigation Development will be presented by the State Water Commission.

This is not all; there are other good things.

9000 CARS OF LEMONS

The Riverside Press canvass of the coming year's citrus output develops the fact that the lemon output of the state this year will approximate 9,150 cars. There are four lemon shipping districts which will handle 1,000 or more cars. These are Orange, Whittier, Ventura and San Diego County. San Dimas is also a heavy shipper with 800 cars.

The shipment of all citrus fruits from California last year was approximately 45,000 cars. It will not reach 40,000 this year.

RAIN IN THE SOUTH

Our weather is being given to us in homeopathic doses this year. The northern end of the state received a few light showers something over a week ago, and last Saturday and Sunday showers quite liberal in some sections were given to the southern end of the state. In Los Angeles the precipitation reached .87 inch, while in the San Fernando Valley it was only .52. From this it ranged to something more than an inch and a half in Redlands, Riverside and other sections. The northermost limit of this storm was Fresno which was given about .2 inch.

NEWS VS. FIELD NOTES

The attention of our readers is directed to another page of this issue to the statement regarding our attitude toward the "field note." We recognize the difficulty of drawing a hard and sharp line between what is pure news and what can be construed as advertising, and it is not our intention to adopt such a hard and fast policy. It is, however, our intention to keep from our columns such irresponsible statements as are often permitted by some agricultural journals. We believe that a paper's first concern is its reader's interests, and it will ever be our policy to carefully guard the confidence that we now enjoy. We believe that before the advertiser will reap the greatest returns from his copy the paper in which it is inserted must hold the confidence of the reader and of other advertisers. To illustrate our point more clearly: Not long ago a contemporary, in refering to a public sale, made the statement that the offering was so uniformly high class that it was impossible to write a different foot note in the catalog about each animal. The statement was made as a matter of news. The result of the sale in question disclosed the fact that individual animals sold at prices varying over $1,300. It may be possible that the writer of the article really believed his statement was true, but if such be the case he displayed a monumental lack of knowledge of livestock values that is astonishing and dangerous.

SOCIALISM?

These are times when any reference to a movement which may be construed as socialistic calls for drastic measures or the imputation that somebody is waving the red flag. At least, such is the attitude of some who are over-fearsome. It is true that in some educational centers there have been shown outcroppings of "parlor Bolshevism." For these we should all be willing to use, and use vigorously, the stuffed club. But we think the California Fruit News is seeing red and refraining from seeing the white and the blue in one of California's best citizens.

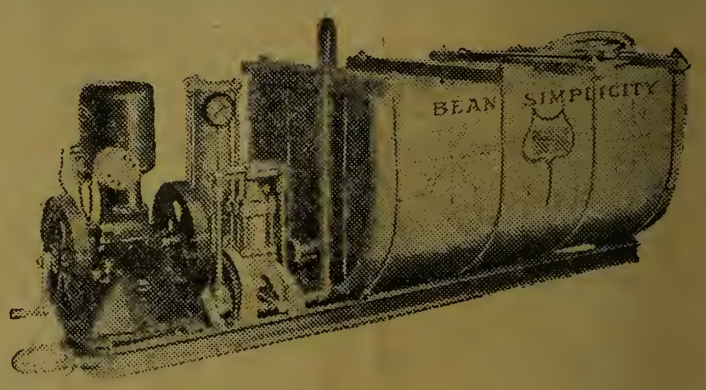
Under the title of "University Professor Dangerously Close to Socialistic Radicalism" Mr. Rowley quotes Dr. Elwood Mead as having said:

"We are living in a time when people are thinking as never before about the right of those who live on the land to own the farms they cultivate. We have come to the point when we must consider public resources like land and water as a trust to be administered in the public interest."

Then editorially adds:

"We are not sure of just what may have been in his mind in writing a thing of the sort quoted above, which we take from a part of this circular and which is, of course, not the whole of it, but are firmly of the opinion that such expressions come pretty close to the line of at least encouragement of radical socialism, and issuing from such a source and authority are quite regrettable, in our view. The meaning conveyed by such statements on reading and without analysis is just the sort of propaganda that has fed up an altogether too large number of our people during the past couple of years to a condition of inflamed hysteria, leading to nothing but destruction."

We have seen no denial on the part of Dr. Mead of his having uttered the above sentiments. But for the life of us we fail to find any incitement to "inflamed hysteria" or wherein "we are * * * thinking as never before about the right of those who live on the land to own the lands they cultivate," or "administered in the public interest" will lead to destruction. All honor to Dr. Mead and the work he has performed for California. We believe that his methods of making available a little portion of old Mother Earth for men who have never possessed it before will lead away from Bolshevism and toward a far higher citizenship.



Here's the New

Bean Simplicity Sprayer

The same Bean dependability—the same high quality of both materials and workmanship, just as much efficiency, in fact a little more—but a highly simplified product.

Ask for information on these new Simplicity outfits. The one shown above is distinctly a "One-man" outfit for the smaller grower.

It's thoroughly high class in every respect—maintains 200 lbs. pressure and operates one spray gun doing the work of two men. It is low in price. It is described in full in our Catalog 33.

Bean Spray Pump Co.

358 West Julian Street

San Jose, Cal.

Clip and Mail

BEAN SPRAY PUMP CO.,
358 W. Julian St., San Jose, Cal.
Gentlemen: Without obligating me, please send me complete information on your Bean Sprayers.

On city pavements as on country roads — wherever men travel in motor cars — you will find written in the familiar characters of the Goodyear All-Weather Tread a reminder that more people ride on Goodyear Tires than on any other kind.

This is an actual photograph of the impression left on a concrete pavement by the Goodyear All-Weather Tread

GOODYEAR

Long Live the Citrus Industry

AS THE writer of the following communication partially admits in his first sentence that he may lay himself open to the charge of being a pessimist, we are going to accuse him of having a little bit of a twist in the wrong direction. The editor of the Cultivator became a grower of oranges nearly 35 years ago, and that almost within a stone's throw of the location of the Upland grower. As soon as the opportunity offered he became a charter member and booster for the organization known at that time as the Southern California Fruit Exchange. Those were the days when things really looked blue, at least through our eyes we saw blue. The packers, the car lines, the railways, all powerful interests, seemed aligned against the few struggling growers. Today the number of growers is vastly increased and they are more harmonious, and the big interests of other days are eating out of their hands. However, here is the comment of our Upland subscriber:

Upland, California, Feb. 5, 1920.
Editor, Cultivator:

I have been called a pessimist by several persons and I deny the charge as a general proposition, but there are times when I lay myself open to the charge.

What I have on my mind now is the future of the California Fruit Growers Association and I wish I had the ability to express myself briefly and intelligently on this subject.

In the daily papers I saw the news item some time last year that The American Fruit Growers, Inc., was organized by produce buyers and commission men, capitalized at $50,000,000; and since that time I have noticed several items concerning their activities and it caused me some uneasy moments.

Recently there appeared in the Upland News a quarter page ad headed "Cash California" and in the last issue of the same paper the local manager gave 11 reasons why orange prices would not go high this year.

I have been expecting some of our able minds to point out to the members of the C. F. G. A. the portent of these signs—but have been disappointed so far. I had hoped that some of the old timers who know by heart the history of the citrus industry in California would come out and show the membership where the danger lies.

I started here six years ago with young trees and have only been delivering fruit two seasons, but I was Association in spirit long before I left the East, so you may safely count on me as one in it to the finish.

Now, then, the danger as I see it: "Cash California" is a term that wields a tremendous power. Anyone who knows human nature knows that we have quite a few members who do not keep informed as they should on what our association is doing or has done for our industry. We also have a few who can be classed as "soreheads" and are prone to stir up discontent and trouble. We also have the element of human greed to contend with and every thinking, observing person knows that they don't practice the Golden Rule. And we must not forget that many men in our industry are working on a mighty narrow margin and often have to face the need of the dollar to keep their little grove in any condition to produce.

It will not take long to show the effect of "Cash California" on these various classes of our membership. When we have lost half of our members it will not be long when we will find that our market is not what it should be or even what it has been. With the market controlled by others and the transportation question far from satisfactory, anyone can see where we will end.

The men who have done the work that made the C. F. G. A. what it is have done a wonderful work, and I take off my hat to them; but none of us must think that our position is secure and go to sleep and drift. We must keep wide awake, stand in solid ranks and add new recruits. We must extend our selling organization, improve grading, packing and distribution so we can at all times deliver to the consumer the very best under our trade mark and at the lowest price possible.

There is a wide field for advance and we should not neglect our opportunities. I am not criticizing—only pointing forward.—Geo. L. Winter.

The suggestions of the subscriber are good and possibly his pessimistic view of the general situation may prove of value in causing us to devote a little time to thinking over the present situation. The world has been seriously upset and the wisest calculations are bound to be discounted until normal conditions return. But on the perfectly safe proposition that when the people are informed they are right we take it that a campaign of education only will be needed to hold California's 10,000 or more citrus growers in line. No class of producers is more capable of grasping the situation and really directing the affairs of its own organization. It is only a question of the rank and file keeping absolute control and preventing autocratic domination which will surely destroy efficiency and weaken the adherence of even most loyal membership.

FROM WOODLAKE, TULARE COUNTY

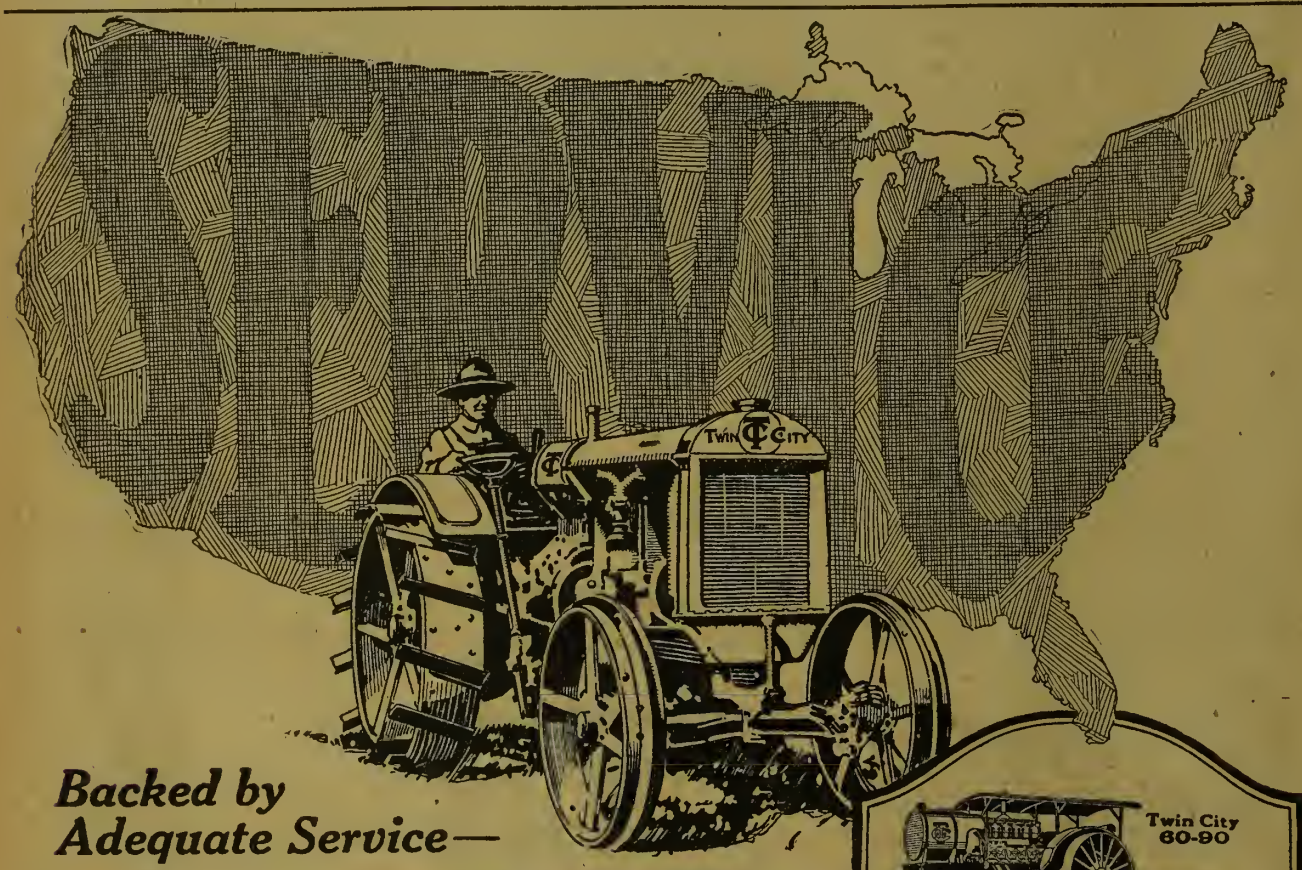
The fruit growers of this vicinity, Woodlake, Tulare County, are much interested in the excellent articles you have published on the important subject of pruning and hope to greatly profit thereby. While the citrus crop of this season is of good quality and fair quantity and none as yet has experienced any harm from frost, it has been very dry, the rainfall to date being below that of last season, which was short the normal supply. Many orchardmen are now getting busy in cleaning out and deepening their wells and in drilling new ones. This will make an extra demand upon the power companies who are now asking for higher rates to meet the increased cost of material and labor for the extensions demanded.

The labor problem among ranchmen and fruitmen is still a serious one and the high wages demanded, added to the enormous cost of feed, tools, machinery and every other item that goes to maintaining production at its maximum, cause much anxiety over the future. A very large acreage of hay and grain will be grown this season. —F. L. Kern.

COMPLAINTS

It is your right—possibly your duty—to complain of any fault in the management of your organization; whether the fault hurt you most, or all alike. Let the complaint have improvement as its aim. No fault should be long tolerated that can be corrected. But in the name of reason, don't back the complaint with a threat of leaving or smashing the association. You would not uproot your orchard because the hired man made a bad blunder in pruning it. This really great and profitable cooperative enterprise should not be endangered, discredited or abandoned because some hired man serving it makes a blunder. Kick him, if he needs it, but don't kick yourself out of a good thing.—Sunsweet Standard.

Another word—Start something, and then be a sport and stay with it. If there are features which are wrong, be one to help make them right, but don't be a kicker.



Backed by Adequate Service—

the TWIN CITY 12-20 fulfills the desire foremost in the minds of thinking farmers, fo a super-powered economical tractor.

Its sixteen-valve (valve-in-the-head) engine makes use of power heretofore wasted. Its TWIN CITY-Ho-ley vaporizing system prepares the kerosene for perfect firing. Its burned gases are quickly and completely discharged.

The result is that the TWIN CITY 12-20 gives you a surplus of power from the same fuel, and delivers it more dependably.

Then, back of this great tractor you have a big organization with branches, repair stocks and experts to give service.

TWIN CITY Power for Every Size Farm

There is a TWIN CITY tractor to meet the needs of every size farm —12-20, 16-30, 25-45, 40-65 and 60-90.

Write for complete story of this super-powered 12-20 tractor and for information on the complete TWIN CITY Line.

TWIN CITY
12-20 Kerosene Tractor with 16-valve engine

Allwork II
KEROSENE TRACTOR

No More Distillate

Now You Must Burn Either Kerosene or Gasoline

Which shall it be, 13c or 21c fuel?

The larger oil companies have discontinued the manufacture of distillate. They are now using a cracking process which leaves no distillate, but separates the light oils into just two grades, gasoline and kerosene. Some of the smaller refiners are still making some distillate, but very little if any of this fuel will find its way to the open market. As long as crude oil is refined we will have kerosene. Tractor engines are divided into two classes, gasoline engines and kerosene engines. Either engine will burn distillate. Gasoline engines will not successfully burn kerosene.

Don't ruin your engine by trying to burn kerosene

Gasoline engines will RUN on kerosene if the fuel is sufficiently heated before entering the cylinders but this does not mean that the engine is SUCCESSFULLY burning kerosene. If ALL the kerosene is not burned, the unburned portion will get past the pistons and into the crankcase, thin the lubricating oil, taking out its lubricating qualities and ultimately ruin the engine. An engine running on kerosene and not burning it successfully will smoke, will run unevenly when idling at a slow speed, will soot up spark plugs, will show loss of power as compared with gasoline and during a run of several hours will noticeably thin the lubricating oil. The final proof comes after weeks of running when the engine will be completely worn out, the cylinders worn large, the pistons worn small, rings worn thin, bearings loose, etc., etc. Our experience of seven years of successful kerosene burning and eight years PREVIOUSLY of unsuccessful kerosene burning has proven to us conclusively that if the engine is not designed and manufactured to burn kerosene it is far cheaper to burn gasoline at many times the cost of kerosene.

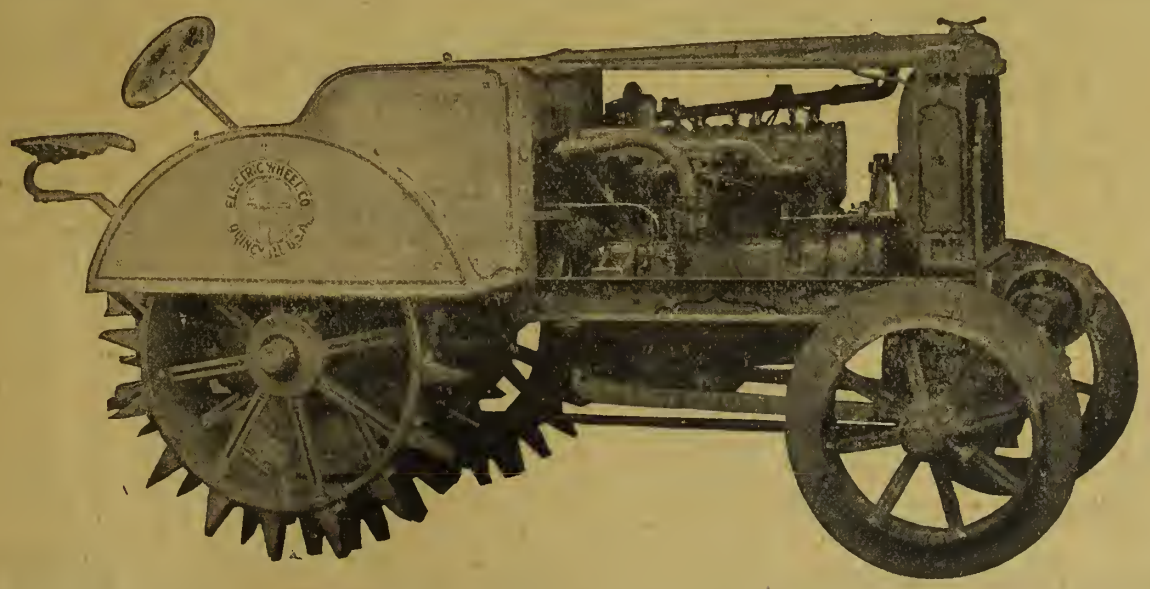
Only a very few tractors are equipped with kerosene engines

Very few tractors are equipped with kerosene engines. All gasoline engines will burn distillate fairly successfully. There is very little difference between the present day gasoline and distillate. But these engines will not successfully burn kerosene and attachments will not turn them into kerosene burning engines. Kerosene carburetors will not do it. Stoves will not do it. Hot spot manifolds will not do it. Water sprays will not do it. Air saturated with water from water clarifiers will not do it—and the combination of all these will not do it.

Allwork II burns kerosene successfully

The Electric Wheel Company of Quincy, Ill., for seven years have manufactured the Allwork tractor to SUCCESSFULLY burn kerosene. Testimonials from Allwork users after years of Allwork service prove this absolutely. The Allwork II kerosene engine is the same engine that has made the Allwork Tractor so famous east of the Rockies. The Allwork engine is manufactured throughout, after years of experiments, to burn kerosene. The cylinder compression is correct, the piston clearances are correct, the piston rings are correct, the valves are correct, the valve clearances are correct, the intake manifold is correct, the water-cooling space is correct, and all other parts of the Allwork engine are correct for successfully handling low grade kerosene. A standard GASOLINE carburetor is used—no special so-called kerosene carburetor is required: all necessary changes were made years ago in the engine itself. Just as much power is produced with kerosene as with gasoline. Allwork cylinders and pistons are kept free from carbon—spark plugs stay clean and valves do not require frequent grinding, all of which is proof that the Allwork engine does successfully burn kerosene. Our written guarantee is your further protection.

Buy an ALLWORK II and Burn 13c Fuel Successfully



This is the tractor that has proven so successful in California. Manufactured strictly for California, it is the one tractor suitable for ALL California conditions. Low, narrow and with a short turning radius suitable for the most closely planted orchard and vineyard and still with sufficient power to pull three or four bottoms anywhere in open field work. Traction equally good in light sand or hard adobe, wet or dry. All working parts completely inclosed and running in oil. More power than was ever put into such a small tractor.

On Exhibition at the National Orange Show, San Bernardino, February 13th to 23rd

Production has now reached a point where a few good substantial dealers can be opened in several good open territories.

TOP DRESSING TALKS, No. 11

How to Fertilize the Orange

Rate of Application

For the lighter types of soil the rate of application of Arcadian Sulphate of Ammonia should be from 300 to 500 pounds per acre, divided into three applications. On the heavier types of soil about one-half this amount.

Time of Application

The first application should be about four weeks before blossoming; the second when the fruit begins to set, and a third about the middle of June. Very often it is advantageous to make a fourth application in September. This not only helps "size" the fruit, but promotes wood and bud growth for the following season.

Write for free bulletin "Citrus Fertilization"

Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Arcadian is the kiln-dried and screened grade, made fine and dry for top dressing purposes. Ammonia 25¼% guaranteed. Made in U. S. A.

PLANT Fruit Trees

WE SPECIALIZE ON FRUIT-BEARING TREES

We grow our trees in the choicest spot in California. Here in Central California the most favorable climatic, soil and water conditions prevail, making possible the production of superior trees and vines. Added to this is our intimate knowledge of the business which enables us to exercise the most intelligent care in growing and handling nursery stock.

You should have our catalogue. Our descriptions of varieties are more complete and comprehensive than in any other book. This book tells you what you ought to know in order to select trees intelligently. Sent free on request.

Fresno Nursery Co.

P. O. Box 615-C Fresno, Calif.

Free Trial---Oregon Seeds

We are convinced that our Oregon grown, acclimated seeds are superior, and know YOU WILL BE CONVINCED when you try them. LET THE SEEDS TALK!

We offer the following 4 regular sized packets, worth 50c, free, except we ask you to send 10c in wrapped coin or stamps to cover cost of labor, envelopes, mailing. Mention California Cultivator.

OREGON GROWN SEEDS

	Regular Price.
1 Pkt. carrot, Oregon Chantenay	10c
1 Pkt. St. Valentine Special Broccoli	15c
1 Pkt. Orange Winter Luxury Pie Pumpkin	10c
1 Pkt. Gill's Improved Golden Bantam Corn	15c
	50c

Will also mail you our 50-page catalogue describing our OREGON GROWN SEEDS, DAHLIAS, ROSES, PERENNIALS, AND NURSERY STOCK.

This offer is good only once to each family.

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

ARTIFICIAL DRYING OF FRUITS

By Robert Westcott

THERE was a large meeting of orchardists and grape growers at San Jose on Saturday, February 7.

It was an all day gathering under the auspices of the agricultural extension department of the state university, and was presided over by Professor W. C. Clarke.

The subject under discussion was dehydration, or methods for the artificial drying of all kinds of fruit, with particular reference to prunes and grapes.

Prof. Cruess spoke at length concerning the various types of evaporators that have been used on a commercial scale, and Prof. Christie discussed the experiments in fruit evaporation conducted at Davis covering a period of five years. Prof. Lufto gave a resume of the experience that prune growers in Oregon and Washington have had with dehydration.

After these, the principal speakers of the day, came short talks by growers who had had personal experience with artificial dryers as well as by representatives of some of the patented devices now on the market.

The consensus of opinion was that there is a distinct advantage in dehydration, due chiefly to elimination of weather conditions in regard to drying, though there is also a greater uniformity of product and, many thought, a better quality in the fruit so treated, and with some of the devices an actual saving in the expense of artificial drying over sun curing.

This latter point applies more particularly to the drying of wine grapes in the coast counties, where, in fact, on account of their lateness in ripening, it is almost impossible to dry the grapes in the open.

The cost of dehydrating under the different systems varied widely. Some reported an actual expense as low as $5 per ton, while others reported as high as two and one-half cents per pound or $50 per dry ton.

Taking this liberal variation into consideration, it would seem to justify the grower in closely investigating the operating cost of any such plant that he considered installing as well as its initial cost and the quality of the product.

It seems quite certain, however, that some of the systems do turn out a superior product in record time and with a saving of labor and drying space, at a total cost approximating the old sun curing method.

Another year or two should eliminate the inefficient dryers and perhaps improve upon the best of those now in operation.

CITRUS INSTITUTE TOPICS

The annual institute of California citrus fruit growers, to be held at San Bernardino February 20 and 21, in connection with the National Orange Show, will be featured by talks by the leading experts of the state. Following is the program:

Forenoon Sessions, Feb. 20, 9:30 A. M.

Topic — Ranch Organization and Extension.

Address of Welcome—President R. E. Swing, National Orange Show.

Cooperative Grove Organizations—T. R. Woodbridge, Upland.

Housing of Ranch Labor—J. D. Culbertson, Limoneira Ranch, Santa Paula.

Trend of Development in the Citrus Industry—Prof. R. S. Vaile, citrus experiment station.

Are We Using the University and the Experiment Station as We Should?—W. H. Fleet, Rancho Sespe, Sespe.

Discussion.

Afternoon Session, Feb. 20, 2:00 P. M.

Topic—The Making of a Citrus Orchard.

The Selection of Stocks—H. J. Webber, director, California agricultural experiment station.

Bud Selection and Nursery Methods—C. S. Milliken, California Fruit Growers Exchange.

Planting Citrus Trees—F. H. Nusbickel, Glendora.

Handling a Young Orchard—W. M. Mertz, manager, Foothill Frostless Fruit Company, Alta Loma.

Discussion.

Forenoon Session, Feb. 21, 9:00 A. M.

Topic—Orchard Management.

The Fertilizer Situation — A. E. Barnes, Fruit Growers Supply Company, Los Angeles.

The Conservataion and Application

(Continued on Page 251.)

Stifel's Indigo Cloth
Standard for over 75 years

Remember—it's the cloth in your overalls that gives the wear!
The only way to tell that the

OVERALLS and COVERALLS

you buy are made of genuine Stifel's Indigo—the strong, last-long, fast-color cloth that positively will not break in the pirnt—is to look for this trade mark *on the back of the cloth inside the garments.*

Dealers everywhere sell garments of Stifel Indigo. We are makers of the cloth only.

Lalley Light is a complete unit—engine and generator—with 16 cell storage battery. It supplies ample electricity for lights, water pump, washing machine, sweeper, cream separator, fanning mill, iron, etc.

Ten Years' Owner-Experience Has Proved Lalley Light

Naturally, there are fundamental reasons why progressive farmers everywhere are installing Lalley Light Plants now.

They recognize that Lalley Light is the most highly perfected electric light and power plant.

They know this because Lalley Light has stood the test of owner experience for ten years.

They know that only through such an experience can an electrical unit like Lalley Light be developed, refined and perfected as Lalley Light has been.

Install Lalley Light NOW

Right now is the best time to begin enjoying Lalley electricity.
You have the time now to make this installation.

You can begin enjoying Lalley benefits and comforts immediately and be ready for the saving in time and labor that Lalley Light will give you when the rush of farm work comes.

Furthermore, delay may mean that you will have to pay an increased price for this essential money-making farm equipment.

Do not delay. See your Lalley Light Dealer today, or ask him to call upon you.

LALLEY LIGHT

THE ELECTRIC LIGHT AND POWER FOR EVERY FARM

Standardization

By G. H. Hecke, Director of Agriculture, Before Western Fruit Jobbers

WEBSTER has defined a standard as that which is set up and established by autbority as a rule for the measure of quantity, weight, extent, value or quality, and he also says that to standardize means to render standard by comparison with a standard. Before any given business can perpetuate itself and become a permanent part of our economic and social life it must meet two general requirements. It must supply some human want or need and it must yield a reasonable profit to those engaged in it. The reason that the fruit business for many years occupied so precarious a foothold in our commercial life was that it did not produce regularly and adequately enough to create and stimulate a demand, and that it did not return a fair profit to the fruit grower. Improved methods of production and modern machinery have gone far to make up the deficiency in farm labor. The markets have been brought closer to the farmer by means of better transportation and systematic, scientific distribution. In addition to these factors, however, important though they are, there was need for some common basis whereon buyer and seller could trade in a particular commodity in language which would mean the same thing to each of them. So long as each individual grower or dealer has his own idea of what is meant by a 'number one' fruit there is nothing to stabilize the business of growing fruit and there is nothing to operate towards the creation of a permanent demand on the one hand or a reasonable profit on the other. Standardization, then, by establishing a rule for the measure of quantity, weight, extent, value or quality, sets up a standard for a given commodity and standardizes that commodity by comparison with that standard. Such a standard stabilizes the business by providing a common ground where buyer can meet seller with the assurance that each is talking in the same language."

* * *

Mr. Hecke follows with history of standardization as applied by the federal government and in several other states. Referring to standardization in this state, he gave its history, and in regard to methods, said:

"In California we have two methods of supporting the standardization work. The one used in the apple law provides finances from the sale to growers and packers of stamps which go on apple boxes. The use of the state stamps is optional with the packer but compliance with the grade and marking requirements is compulsory. The other method of carrying on standardization as seen in the fresh fruit law is by charging its enforcement to the director of agriculture and the county horticultural commissioners. The expense under this system is borne by the state and county treasuries. Each of these methods has advantages and disadvantages. The comparison cannot be carried as far as I should like to carry it because it is not possible to get a definite idea of the exact cost of standardization work in some counties.

"The apple law is charged to the director of agriculture for enforcement. He employs men, so far as funds will permit, in the localities where their services are most needed. The districts assigned these men are not confined to certain political lines but may cover all or part of several counties, based on reasons of geographical convenience and efficiency. Employed by the director of agriculture in accordance with the civil service rules of the state, they may be discharged in the same way and they are at all times subject to the direction of the central office. Under the fresh fruit law the director of agriculture is made ex-officio chief inspector of fresh fruits for the state. In each county the county horticultural commissioner serves as fresh fruit inspector within the boundaries of his own county. He is assisted by horticultural inspectors who serve as deputy inspectors of fresh fruits. These men receive their appointments within the county and draw their salaries from the county treasury. Because of the difference in the sources of revenue of the various counties there is necessarily a corresponding difference in the amount of funds available and hence some counties are able to employ more inspectors than others. This variation does not bear a true proportion to the needs of the same counties for inspectors, and as a result the fresh fruit inspection is carried on to a much greater degree in one county than another. The director of agriculture surveys the apple situation of the state and deals with it as a state wide problem with uniform rulings and policies applied equally and impartially in each section. Under the fresh fruit law the county horticultural commissioner is more familiar with the conditions of his own county and his attitude towards the standardization work is necessarily influenced by this fact, so that he does not obtain a true perspective of the industry as a whole. The result is a lack of uniformity in executing regulations designed primarily to promote uniformity."

* * *

In closing Mr. Hecke said:

"The essential purpose of standardization is to stabilize the business of producing and marketing farm products. This stabilizing influence exerted by standardization will depend directly upon the quality and quantity of the inspection forces. The inspection forces must be made efficient to the highest degree.

"The efficiency of the inspection and the value of the inspection depends upon the freedom of the inspector to make his decisions on the basis of merit only, which requires that he be relieved of any possibility of a financial interest in the number of cars certified. Therefore, after five years of standardization in California the time has come when we know our needs, we know what we want and we knew that if we get together and pull together we will surely get it—a system of standardization that really standardizes."

SOME RAISINS

Here are some interesting figures taken from the last issue of the Sun-Maid Herald regarding a portion of the raisins handled in California. Figures are rather "dry stuph," but it is interesting to know that if Seedless Raisin cartons used last year were placed end to end they would reach from Fresno to Constantinople, a distance of 9,349 miles.

A single day's pack would cover 122 miles.

And this does not include the million cartons of cluster raisins packed.

We used over 21,866,000 board feet of lumber to furnish shook for our wooden packing cases. This means that a small forest of 15 acres, containing some 6,247 pine trees, was cut, hauled to saw mills and made into the various sized shook. To give you an idea of what an immense business this one item is, it would take the average size shook mill ten months to cut and saw this lumber, and over 900 freight cars to deliver it.

Besides this great quantity of wooden cases, over 1,750,000 fiber containers were used. To seal these paper cases it took 11,000 gallons of silicate of soda, or about as much as the rain we've had all winter.

If one should take all the wood and fiber cases and place them end to end they would cover a distance of 3,500 miles.

Eleven thousand four hundred fifty kegs of nails were used in making the wooden cases, and over 500 miles of "Ribbonzene" was tied in bow knots on our fancy layer pack. On government and export cases 937 miles of strap iron was used to reinforce the cases.

Over 60,000,000 sheets of "parchmyn" paper was wrapped about our seeded pack. If it were spread upon the ground it would completely cover more than 640 acres.

From the looks of things, the way

THE E-B LINE
EMERSON BRANTINGHAM
FARM MACHINERY

Eight Feet at a Round

With its 8-foot swath the E-B Standard Mower does a lot more work in less time. And it does it with no more pull on the horses than many a 5-foot mower.

The E-B compensating lever and spring carries the weight of the cutter bar on the drive wheels. Side draft and weight on the horses' necks are eliminated. The life of the mower is increased because there is less wear and tear.

There are other sizes, too—4½, 5, 6 and 7 foot swaths, all with correspondingly easy pull. They mean quick, thorough work on the most economical basis.

Since 1852 the Standard Mower, now known as the E-B Standard, has been recognized as the true measure of excellence in mowing machine construction. It can be seen now with other haying tools from the full E-B line at any E-B dealer's.

The E-B Hay Loader
gets all the hay—without wadding, rolling or twisting. Cleans the windrow as it goes along. Handles the hay gently. Does not tear straw or leaves or thresh out seeds.

The E-B Side Delivery Rake
rakes three swaths instead of two. Light, fluffy windrows that allow hay to cure gradually and thoroughly.

TOP WORKING THE WALNUT

(Continued from Page 239.)

ond year and 15 pounds the third year. After this period they developed lateral growths rapidly and the crops increase correspondingly.

The new growth will start strongly and during the first year should be supported by lath or inch stakes firmly fastened to the tree stubs. They may be nailed, but the second year they should be supported by tall stakes two inches square, starting at the ground and may be fastened to the trunk by a spike or large nail. Wires may then be run between the supports so they will lend strength to each other in holding steady the new top during strong winds. To these uprights the branches must be securely fastened, not alone to guard against windstorms, but the weight of foliage may be so heavy that unsupported branches would droop and produce a one sided top. As three-fourths of the three year old top is produced the second year, support beyond the second year should not be needed. Do not head back the first year's growth; let it grow as high at it will, or you will get broom like tops. The next year the top will fill laterally.

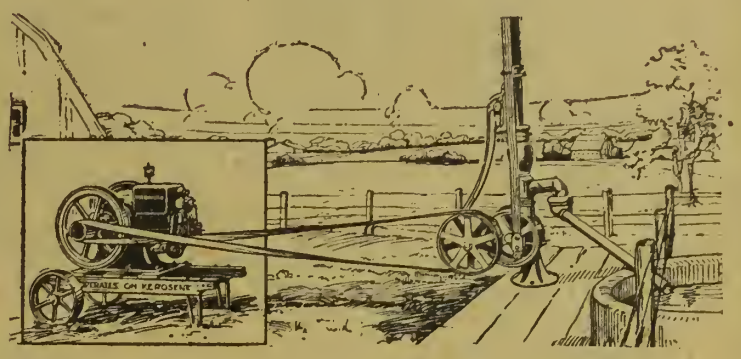
The Operation

The ten year old black walnut had been cut back to stubs of three to five inches, diameter before the audience gathered. This was the first rough surgery. A second cutting of each was made to produce a smooth even surface and this double cutting was advised for all. After the saw the next tool used was a large knife for splitting, made from a blacksmith's rasp or file, the blade about two inches wide and six inches long. A mallet is used to force this into the wood. A smaller but thicker right angle wedge is then driven in to keep the splits open while the scions are being inserted. On stubs of this diameter two splits are usually made and two scions put in each, making four to a stub, about equidistant though if but two grow there will be plenty if the old tree had several branches.

V-shaped scions of about six inches length are inserted. These are generally solid one-year growth that is not too pithy. Some of the more successful work of the past has been done with scions having a two year old base and a one year tip. It is not necessary, however, to use tips or terminals for secondary parts will do. Each should have about four good buds.

The scions are so placed at the outer edge of the splits that the cambium, or soft inner bark, will come in contact with that of the stub. This is the most particular part of the operation and to be sure that some contact is made it is better not to place scion so barks are parallel, but to tilt scion slightly. After properly placing, the wedges are taken out and the scions are securely held in place by the closing splits. There is no danger of this pressure forcing the scion out. After all are in place a few wraps of string or raffia are wound about the stubs, as the bark may loosen during summer, though this precaution is hardly necessary as the splits hold the scions by a strong pressure and bark seldom loosens if heavily waxed. Now comes the most necessary precautionary measure—the air must be kept out of every part. Therefore stub, splits, base of scions and all wounded parts are thoroughly painted with a grafting wax. This is made with four pounds of resin, one pound beeswax, one-fourth pound tallow, mutton preferred, or a pint of boiled linseed oil instead of tallow. The whole stub with the scions is then covered with paper bags until the scions grow and push bags off. This also prevents sun from melting wax so it will run away from wounds, and all should be repainted with this wax once or twice during the summer, depending on the weather. Success hangs on the first year's care, and the most important point is to keep air out. The best time for top-working is the month of February. The scions may be cut earlier, if desired, and will keep from four to six weeks packed in moist sawdust.

The Farm Drudge
" Handyman
" Chore Boy
" Burden Bearer



THESE nicknames and others are frequently attached to the good kerosene engine of which we sing the praises. But, since it is a very serious and practical prose song, the engine shall here be called strictly by its proper name—International.

International Kerosene Engines are annually doing millions of hours of work: Annually taking the menial, toilsome, everyday farm jobs—pumping, sawing, separator turning, washing, grinding, shelling, etc.—off the lame shoulders of grateful men, women and children the nation over: Annually adding to the service that makes farm leisure possible and farm life more than ever worth while.

International quality in general and **International Kerosene Engine** quality in particular are everywhere admitted and admired. These engines are reliable, simple, long-lasting and economical. Among the sizes—1½, 3, 6, and 10—is your correct size. See the International dealer.

A Planet Jr. garden tool

helps the best seeds to produce more abundantly because it cultivates carefully, accurately and properly. It makes your work more profitable because it saves time, labor and money. Strongly and carefully made to last a lifetime. Fully guaranteed.

No. 4 Planet Jr. Combined Hill and Drill Seeder, Wheel-Hoe, Cultivator and Plow sows all garden seeds (in hills or drills), plows, opens furrows and covers them, hoes and cultivates them all through the season. A hand machine that does the work so thoroughly, quickly and easily that it pays for itself in a single season.

No. 8 Planet Jr. Horse-Hoe is stronger, better made and finished than any other one horse cultivator. Because it does a greater variety of work in corn, potatoes and other crops in rows, and does it more thoroughly, it enables you to increase your yield. Cultivates deep or shallow in different width rows. Its depth regulator and extra long frame make it steady running.

Planet Jr.

Saves Farm Labor

Keeps

Save 90% of all Ditching Cost with THE Martin O.D.&G.Co. Ditcher and Grader

No More Ditch Problems

Here is a tool that has swept through the West, winning enthusiastic friends everywhere. It makes and cleans ditches up to 4 feet deep, any width. Builds dikes, grades roads, does every dirt moving job in one-tenth the time and cuts the cost to almost nothing, compared with old methods.

No matter what your dirt moving job, try the Martin. It works in any soil, wet or dry, with horses or tractor, and no job is too tough for it.

Don't Fool With Old Laborious Methods

Get a Martin on trial. Try it on level or hillside land—anywhere. Money back if not absolutely satisfied. The Martin has no wheels, cogs or ratchets to get out of order.

It is made to last a lifetime—and does it. All-steel, adjustable and reversible. Will go anywhere. Low first cost. No upkeep cost. Guarantee makes you absolutely safe. Let us send you our free book of the Martin and list of users near you.

The Home Garden

By A. F. Clarke

I'M genuinely sorry for the person who hasn't felt the urge before this to make a garden. If he hasn't studied the seed catalogues with their alluring colored plates picturing vegetables of almost unbelievable perfection; if he hasn't figured out where he could stick in a few rows of beets and radishes and turnips and tomatoes and green corn—then such a person is an incurable misanthrope and he should be allowed to mingle only with bankers and brokers and such like folks who never feel the urge of the soil and an internal hanker to turn the good brown earth and make things grow in it, fruit and flowers and berries and vegetables.

During the war the home garden reached its era of highest popularity and achievement. And its need has not passed even should the solons in Washington get together and sign the peace treaty. The fact is that housewives are paying the Chinese and Japanese more for vegetables today than ever before and the home garden is a greater necessity—and this applies as well to the big farmer and fruit grower as to the amateur back lot gardener.

No garden is a real success unless it has been carefully planned, a plot worked out on paper to best utilize the ground and to provide for a wise crop rotation.

Sandy loam is the recognized garden soil of California, but many of the lighter soils have been made to yield good crops, and even the unyielding adobe has possibilities if treated right after each irrigation.

It is not advised that gardens be planted in any but newly planted orchards. Where trees are full size they need all the food there is in the soil and the vegetables and trees will both be losers. Beans furnish about the only exception to this rule.

The farm garden should be planted in long rows to make horse cultivation possible; in fact, the patchwork garden beds of our youth have disappeared. They were too fussy and unhandy. Room must be allowed at the ends of rows for the horse to turn around. Garden ground should be thoroughly worked and pulverized. The dust mulch is a real factor in conserving moisture and aiding growth. Well rotted stable manure is the best growing garden aid, but if it is not available 300 pounds of commercial fertilizer to each 1,000 square feet will do.

It's a good plan in making up your garden schedule to provide for three plantings of sweet corn and two of string beans. The corn should be planted in rows rather than in hills. Golden Bantam and Oregon Evergreen are the popular California varieties for early and late planting, with the Country Gentleman as second choice.

Early peas and potatoes may be followed by beans, peppers and eggplant, and the soil kept busy the while.

February the Big Planting Month

February is the big planting month for Southern California for all except such tender plants as peppers, beans, tomatoes, roselle, melons and squashes. It is the month for potatoes, all the hardy root crops, peas, onions, asparagus and rhubarb.

Some of the New Ones

The amateur gardener is ever alert to try new things, and this season he will likely add to the old favorites such comparatively new things as sea kale, New Zealand spinach, Chinese cabbage, chayote, French endive, lemon cucumber and Monstrous lima. Full cultural directions appear on the seed envelopes and in the seed catalogues.

Currants and gooseberries find a congenial habitat in some of our coast localities, and where the climate is favorable they should have a larger planting. The roselle is a good substitute and seems to thrive most anywhere if planted late enough to avoid the late frosts.

Garden Notes

Potatoes will get a much quicker start if "greened off" in the sun and allowed to start short sprouts before planting. If the cut seed is dipped in ashes or gypsum or air-slacked lime the seed will retain its moisture and absorb a needed fertilizer. Do not plant on newly manured ground. The manure should have been worked into the soil in the fall and allowed to thoroughly rot.

Good time to give the asparagus bed a top dressing of stable manure, and rhubarb will appreciate the same treatment.

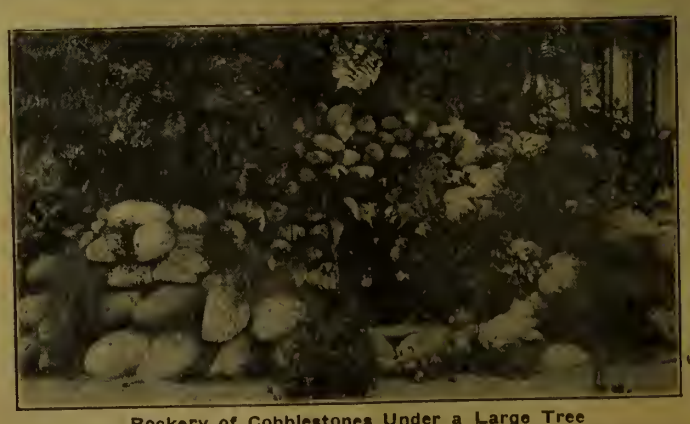
Beets should be planted often as they are best when no larger than hen's eggs. And if you haven't tried them you will find the sugar beet a fine pickling beet.

A last word of caution—don't plant garden seeds too deep.

Rockeries

It has been said that gardening to harmonize with its surroundings should partake of the nature of the country in its composition and material. If this be good logic we should have rockeries in the gardens of much of the state. In Stockton and vicinity rockeries might not be proper, for never was a soil or district more free from stones, but in the south end of the state and in many other parts stone clad hills or mountains are in plain view from thousands of gardens.

A rock garden is best some distance from the house, out of sight of it if possible, for it is so far apart, so distinct from gardening in general, that it should be isolated. But simple rockeries have a place about the base of buildings to fill in that hard angle between the house wall and ground. If the house is of incombustible material the rockeries may lie against the walls; otherwise they should not be higher than the foundation unless by furring with lath and covering with with boards to allow air between house and rockery to protect paint and house from discoloration and decay. Plants for rockeries need not be different from those for gardening in general. Usually rockeries are turned into ferneries, but if in the sun they would do as well for cactus. Of course the conditions would not be favorable for bog plants, but conversely they are



Rockery of Cobblestones Under a Large Tree

In this case a fine araucaria had been trimmed up eight feet by some vandal and the rockery was built to remedy the lack of foundation. It contained many tons of boulders and thousands of plants of many kinds.

fine sites for plants requiring superb drainage. In a shaded spot, with a leaf mold filling, a rockery may be made a fine "begoniary." And a collection of well grown begonias is not surpassed in beauty by any group of garden plants.

POTATO HISTORY

Mr. T. H. Lambert of El Monte, Los Angeles County, a pioneer potato grower of that section, says:

"I shipped my first potatoes about 20 years ago as an independent shipper. The two leading varieties at that time were known as Chinese Pink Eye and Centennial. About five years later the White Rose was introduced and from that time has been the variety I have most largely grown.

"During the season of 1910 potatoes were selling for $1 a hundred, but later dropped by degrees to 60 cents. Then we called the growers together and formed the San Gabriel Valley Potato Growers Association. After this, by reason of an ultimatum delivered to the shippers, the prices gradually rose, and at the close of the shipping season were about $1.25 a hundred. In 1911 the price went up to $2.50, and this resulted in so many potatoes being planted in 1912 that the bulk of the crop brought the grower about 70 cents. The tuber moth was also bad that year and many shipments were found in bad condition when they reached the Eastern markets. In 1909, before the association was organized, I shipped from Irvindale to Las Vegas, Nevada, the first carload of potatoes that was iced. The ice plant at Las Vegas had been destroyed by fire and the buyer wished the potatoes shipped under ice. They reached there in excellent condition and I learned subsequently that the ice remaining sold for enough to pay for the entire icing.

"In 1917, the growers, realizing that considerable loss had been occasioned by decay when potatoes crossed the desert in ordinary refrigerator cars, decided to ice the cars and persuaded the buyer at the other end of the line to pay for icing, and there have been practically no losses since they started to ship in this manner. Icing the cars not only guarantees the potatoes to go through in good shape, but opens up a larger market for the product as they can be shipped farther east. Therefore the association and the California Vegetable Union, who were the pioneers in the icing of potato shipments, made possible the larger market for this product. In spite of the fact that we have been unsuccessful in getting all of the growers into the association, we are holding our own and not losing ground and we hope in due time the growers will all understand the advantages to be gained through the association and will join in with us, which would result in satisfactory returns to the growers. In 1917 another branch association was organized at San Fernando and in 1919 one at Shafter, Kern County."

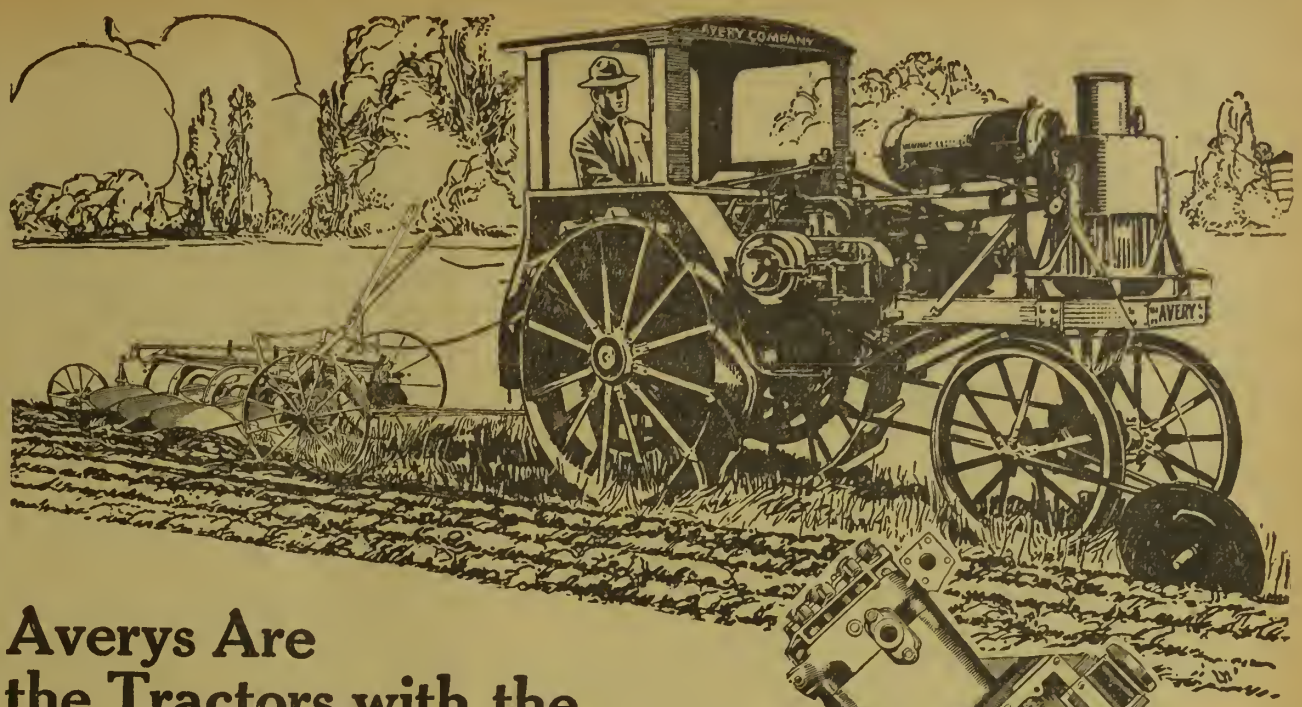
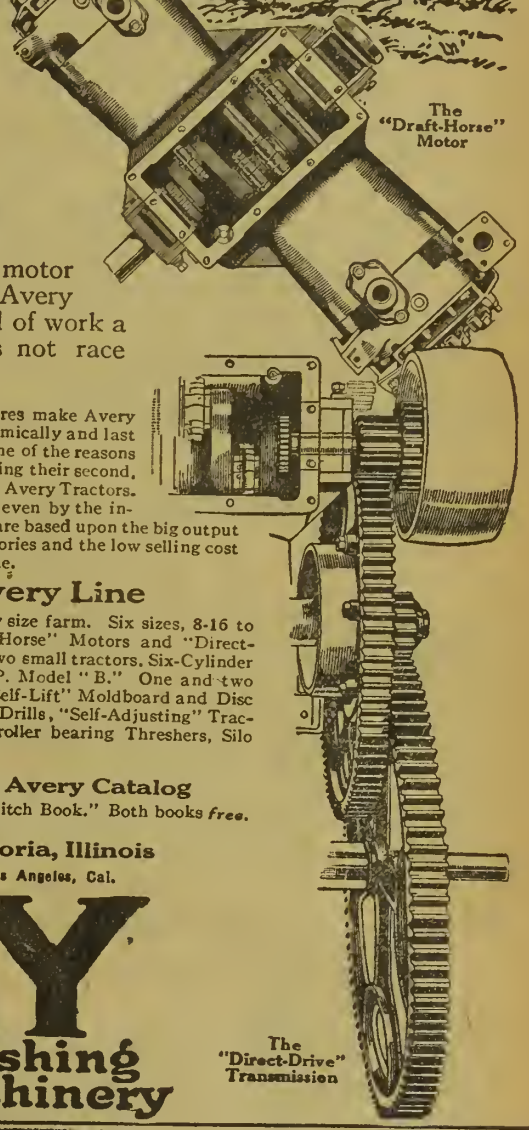
The sessions will be held at the First Methodist church at San Bernardino. The dates of the National Orange Show are February 13 to 23.



Averys Are the Tractors with the "Draft-Horse" Motor and "Direct-Drive" Transmission



WHEN you get an Avery, you get a tractor with a motor especially built for tractor work, and exclusively for Avery Tractors. It is built like a draft-horse for the kind of work a tractor must do. *Powerful, heavy duty, low speed*—does not race under light loads or stall under heavy pulls.

It is a horizontal opposed motor improved and perfected with many exclusive Avery features. Its length distributes the weight properly between the front and rear wheels. Its narrow width makes possible a narrower tractor with less side draft. Also a short, heavy, practically unbreakable crankshaft—requires only two main bearings—always in perfect alignment—quickly adjustable with an ordinary socket wrench.

It is built with five-ring pistons, thermo-siphon cooling system, valves-in-the-head, renewable inner cylinder walls, and gasifiers that turn the kerosene or distillate into gas and *burn it all.*

Because of its low speed the power of the Avery "Draft-Horse" Motor is delivered through

The Avery Patented Sliding Frame Transmission

giving "Direct-Drive" in high, low, reverse, or in the belt. The belt pulley is mounted right on the motor crankshaft. You get a larger percentage of the power developed by the Avery "Draft-Horse" Motor at the drawbar, and *all* the power in the belt.

These and other big features make Avery Tractors run steady, economically and last a long time. These are some of the reasons why Avery owners are buying their second, third, fourth and even sixth Avery Tractors. They are easy to operate, even by the inexperienced. Avery prices are based upon the big output of three large Avery factories and the low selling cost of the complete Avery Line.

The Avery Line

includes tractors for every size farm. Six sizes, 8-16 to 40-80 H. P., with "Draft-Horse" Motors and "Direct-Drive" Transmissions. Two small tractors, Six-Cylinder Model "C" and 5-10 H. P. Model "B." One and two row Motor Cultivators. "Self-Lift" Moldboard and Disc Plows, Listers and Grain Drills, "Self-Adjusting" Tractor Disc Harrows. Also roller bearing Threshers, Silo Fillers, etc.

Write for the Avery Catalog

and interesting Tractor "Hitch Book." Both books *free.*

UNCLE SAM AT ALHAMBRA

The United States department of agriculture seems to regard the Alhambra district, 12 miles east of Los Angeles, as a favorable field for study, for it now has two staffs in the field there, and another plant pathologist, here from Washington to study diseases of the strawberry, has been advised to settle there, although at present in another center.

D. G. Milbrath, plant pathologist, has some interesting field subjects which he is watching closely. Among these is a block of cauliflower plants just maturing. One row is of a standard local variety, and next to it are 14 rows each of a different variety, the seeds coming from a famous English seed house. The chief purpose in growing these is not to find varieties best adapted to local use, but as host plants to be inoculated with the "ring spot" disease to determine what varieties are most resistant to it. This disease is not present in Southern California and so far efforts to inoculate the cauliflower in that section have failed. It is thought the air may be too dry. In other parts of the United States and in damper parts of California, however, the growers are much troubled with it. One plot during the summer was in tomatoes for Mr. Milbrath says six fungi attack the southern tomatoes, and their control is one of the coming big prohlems.

Not far from the laboratory just noted is one known officially as the United States truck crop insect lahoratory, under the charge of Roy E. Campbell, entomologist, and housed with him is W. M. Davidson, who is studying insects infesting deciduous fruits. He has plenty of host plants in the orchards of the neighborhood, but Mr. Campbell has a nearby field planted to vegetahles seriously subject to insect pests. Not far away the California state department of agriculture has an insectary where Harold Compere is specializing on parasites of the hlack scale. So that the Alhambra fields are well covered with hunters for hoth insect pests and plant diseases.—E. B.

FIG DEVELOPMENT

Five years ago I planted some varieties of figs on my ranch at Woodlake, Tulare County, among which were some Smyrnas or Calmyrnas as they are called in this state. As advised I planted a wild, or caprifig, near the others, and the first year the capri produced the regular crop of little, hard fruits which in time developed the little blastophaga which seemed to duly fertilize the Smyrnas, giving well developed fruits. Owing to a leak in the irrigating pipe near the wild tree, it made an unusual growth and is now double the size of the other trees, but for the past three years its few fruits have developed into large edible figs with no blastophaga and consequently no matured crop of the Calimyrnas. Is this a common experience and can the caprifig he made to revert back to its proper business of producing insects as well as fruits? —F. L. K.

This is certainly a most uncommon experience, for excessive irrigation could hardly change the nature of the tree so as to cause the quality of the fruit to change as is suggested above. However, we will be glad to hear from any others who may have observed similar behavior on the part of trees thought to be caprifigs.

ROOTSTOCKS FOR STONE FRUITS

To secure information for an inquirer, we recently wrote Prof. W. L. Howard, in charge of the new deciduous fruit station at Mountain View. We asked as to best rootstocks for various soils and conditions. Prof. Howard writes:

"Peach has been the favored rootstock for peaches, almonds, and even plums and prunes, and sometimes apricots, where the soil is especially dry and warm. In a deep moist soil, peach has proved to be a good stock for almonds, hut, so far as I can see, the almond does just as well. Near Davis there is an almond orchard a little over 50 years old, where the trees are still quite vigorous and are perhaps the largest in the state. This orchard was believed to be on peach root, but I recently noticed that one of them, in sprouting from the rootstock, has proved to be an almond.

"Peach as a rootstock will undoubtedly stand a wetter soil than the almond; in other words, overirrigation may kill almonds on almond stock, when the same treatment would not injure them on peach stock.

"Crown gall or root knot is somewhat more virulent on almond than on peach, and for this reason many people prefer to have their almonds on peach stock. I think this point is comparatively unimportant, as the disease is about as likely to attack above the union as helow it. Both almond and peach have been successful as rootstocks for the almond, and unless one has an unusually dry or unusually moist soil, there would be little choice as to which should be used."

CHEMISTS REPORT ON OLIVES

The board of health of Pennsylvania has gone after California ripe olives and gone after them right. The "poison" scare was responsible for this activity. The board secured the services of Chas. H. Wall, dean of Philadelphia College of Pharmacy, and Randle C. Rosenhergcr, bacteriologist, Philadelphia General Hospital. These specialists report:

"The investigation of the quality of the ripe olives as sold upon the Pennsylvania market, which we have been making under your direction during the past month, has been complcted. Two hundred and fifty-four samples have been examined, representing 71 different brands and 100 styles and sizes. The investigation included a thorough, comprehensive serics of chemical tests for adultcrants and proservatives, including boric, benzoic and salicylic acids, formaldchyde and also alkaloidal poisons. Nothing ahnormal chomically was detoctcd in any of the samples.

"Most of the samples woro in cans

"I made one mistake—But this time I think I picked a winner"

(From a letter to the Western Electric Company)

"If I was a mechanic instead of a farmer, I would have bought a Western Electric Outfit in the first place, and not waited till I was several hundred dollars poorer and wiser in the bargain. I am not going to say anything against other plants, because I know that isn't the way you work. I can't even tell the whole truth about your own outfit for fear that people might think you paid me to boost it. You don't have to. H. W. Levis

EDITOR'S NOTE: Mr. Levis is a farmer near West Chester, Pa.

When it comes to electricity I give up

"I believe the wiser a man is, the quicker he will admit how little he knows about electricity. We can see and touch mechanical things, but when somebody gets talking about electricity, he can tell us pretty near what he pleases, and we can't dispute it.

"Take batteries for instance—the most important part of any light plant. We farmers, and even the wiser ones, talk about current flowing into a battery and out of it. But how many people go beyond that? Now look at it this way. If you shoot a stream of water into a bucket fast enough, most of the water will splash out as fast as it splashes in. And if the bucket is an average wooden one, it won't be long before the bottom pushes out. To you men whose batteries are giving trouble, and you who haven't bought yet, I'd suggest first of all that you consider how the battery is charged by the generator. If the current comes in fast at first and then slows up gradually when the battery fills—as with the Western Electric—that means you'll have long-lived batteries. Otherwise you're 'out of luck,' as my son says since he came back from France.

Power and light, or light and power—which?

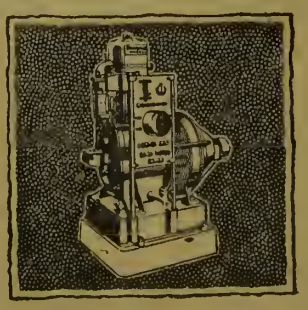
"When I started to buy a plant, I was dead wrong about the lighting end of it. I had a lot of gentle hints at home and heard talk around the neighborhood about how nice electric light is—and it is nice. But what I needed, and what I think nine farmers out of ten need, was a piece of machinery, first and last—an engine to help me do the farm work. Because if I had power enough, light would go with it as a matter of course.

"It took me quite a while to wake up to the fact that it would be an economy to pay a little more for a large outfit that supplied plenty of power, as well as light, rather than to buy a slightly cheaper and much smaller plant that would furnish light only. Right here's the important thing, and the farmer who buys an undersized plant is fooling himself just as I came near doing, because on a farm, power is about the only thing you need except brains, and the only thing that costs nothing when you don't use it.

What I insisted on was an engine that would *run*

"Of course getting plenty of engine is one thing and whether the engine will run is another. You don't want to buy till you've seen the engine in action, any more than I did. Now I don't know what your experience has been, but mine tells me that for genuine dependability you can't beat a valve in head, 4-cycle kerosene engine—that starts just by pressing a switch and runs in all kinds of weather. These are only some of the points about my new Western Electric Outfit. There are lots others I could talk about for pages yet—like that feature of the throttle governor to give uniform speed under any load you please, and the splash system of oiling that's as certain as it's easy. But I figure you'd rather find out about these points for yourself than read my remarks.

"Please don't get the idea I am trying to convince you that there are no good farm plants except the Western Electric. There probably are. But if you can tell me one that's any better, or made by people who are fairer to a buyer or who have been in the electrical business more than 50 years —I'd like to congratulate you, because you are some little finder."



Western Electric Power and Light

Maybe some of the information that helped Mr. Levis decide will help you too in choosing a Power and Light outfit. Just write for booklet CC-I, Western Electric Company, at Los Angeles or San Francisco.

Makes the Battery last longer

DITCHES, TERRACES, GRADES
DOES THEM ALL WELL

The **Austin** Farm Ditcher, Terracer and Road Grader is a very useful implement that will keep itself busy on any farm.

Digs V-shaped ditches to a depth of 4 feet. Sides slope at angle of 45 degrees and will not cave in.

Terraces hillsides so as to prevent soil washing and to make slope hold moisture.

Grades roads and keeps them in condition.

Unequalled for backfilling trenches.

and jars and all of these were in perfect condition as regards their preservation. There were no swelled buckles or leaky containers, although some of the packages were dirty and shopworn. None of the samples possessed any offensive, putrefactive or decomposition odor and in the majority of cases the flavor was good, some few being insipid. The consistency and color were both variable, probably due to different stages of ripeness and to the treatment before being packed.

"From the chemical and bacteriological examinataions and the results of animal inoculations it can be safely said that none of the olives submitted contained anything poisonous or harmful. The bacillus botulinus (or other disease producing organism) was not found, nor were any of the samples found to be adulterated in any manner whatever.

"If ripe olives were likely to cause botulism there was abundant opportunity among the laboratory workers for the disease to develop, for, supplementing the preliminary tests, they were eaten freely throughout the work with no untoward results. In our opinion, the chances of such poisoning are so extremely remote that the olive consuming public who favor the ripe variety may resume their diet with a feeling of perfect security."

PROTECTION AGAINST APRICOT BROWN ROT

Declaring that science has not yet found a way to give the farmers complete protection against the apricot brown rot, W. T. Horne, associate professor of plant pathology in the University of California, points out methods of reducing trouble caused by the disease. He states:

'Where the disease was present last summer or the year before, there are now left at least a few old dried rotted fruits in the trees. These, called mummies, have the fungus still alive in them and await only abundant moisture to start forming spores which are carried by the wind to all parts of the tree. The mummies are easily seen now and can be gathered without difficulty. Dead twigs killed by the twig blight last spring should also be gathered from the trees as far as possible since some of these also contain living fungus. The material should be burned or buried deeply enough so that it will not be plowed out for several years."

Professor Horne suggested three sprayings with lime-sulphur solution after the clean-up; first, as the buds begin to swell, second as the first blossoms open, and third, when most of the petals have fallen. "Full winter strength, that is one to ten, may be used for the first two sprayings and a weaker solution one to 30 for the third. A crude oil emulsion spray shortly before the buds start to swell has been reported to be favorable and might take the place of the first lime-sulphur spray."

In recent years, Professor Horne stated, there has usually been enough injury apparently to justify spraying in all except the most frostless situations. The interior districts of California particularly with dry atmosphere in fruit ripening time escape injury to the fruit and apparently also the twig blight phase of the disease. "California suffers less than countries with more moist summers," Professor Horne declared.

Orchards with heavy cover crops have been observed to suffer more from twig blight than those with bare ground since a large growth of vegetation in the orchard at blossoming time and immediately thereafter considerably impedes the circulation of the air about the trees and increases the moisture in the air, according to Professor Horne. "Do not allow a heavy cover crop to stand after early full bloom, and if possible, the surface of the ground should be stirred with some form of light cultivator."

Professor Horne states that no treatment can yet be recommended for preventing rotting of apricots near the time of ripening on account of danger of injuring the fruit by soiling it or of injurng the trees. "Therefore, every possible effort should be made earlier in the season, as suggested, to control the disease."

For All Farm Lighting

BOSCH
HIGH TENSION MAGNETO

Any Farm Lighting System is more reliable, more dependable and more enduring when powered with a Bosch High Tension Magneto Equipt, properly designed gas engine.

Fairbanks-Morse Engineers, after months of laboratory and field experimentation, decided on the world's highest priced ignition system—Bosch High Tension Magneto Ignition.

That decision was based on facts. They found their famous "Z" engine developed more power and was more dependable when Rip Roaring Bosch Sparks fired the mixture.

Apply the results of that costly and complete Fairbanks-Morse investigation to all your Farm Machinery. For utmost power from any fuel, for enduring economy, and for absolute dependability, insist on Bosch High Tension Magneto Ignition.

"I Plowed 9.28 Acres from noon until 8:00 P.M"

"The day this snapshot was taken, I plowed 9.28 acres from 12 o'clock noon until 8 P. M. The field was 290 rods long and I plowed nine rounds. This Fall I pulled a 26-inch separator, threshed about 1,000 acres of grain. One day we threshed 800 bushels of wheat in less than eight hours. I think the LAUSON is a good machine."

CLAUDE KAMP
WOLVERTON, MINN

The John Lauson Mfg. Co.,
New Holstein, Wis.

Gentlemen:-

Your favor of the 28th ult. received and am enclosing kodak pictures together with some negatives I happen to have on hand, also a snapshot of myself plowing with the tractor. The day in April 1919 this snapshot was taken I plowed 9.28 Acres from 12 o'clock N. until 8.00 P. M. The field was 290 rods long and I plowed 9 rounds. I pulled a 36" Case Separator this fall, threshed about 1000 Acres of grain, it handled the Case nicely, one day we threshed 800 Bu. of wheat in less than 8 Hrs.

I think the Lauson is a good machine if properly taken care of.

Yours respectfully.
CLAUDE KAMP.

This is what Claude Kamp of Wolverton, Minn., says after owning his tractor for two seasons.

Year after year LAUSON TRACTORS have gained favor with the better class of business farmers—men who consider service and satisfaction rather than price. You will usually find LAUSON owners the leading and most prosperous farmers in the locality.

Measuring and Estimating Corn

Will you kindly advise me how many pounds of corn in the cob makes a bushel? Also how many pounds in a bushel of shelled corn? How many cubic feet of corn in a crib does it take to make a bushel. This refers to what is called big yellow corn grown in the Sacramento Valley.—Subscriber, Sloughhouse.

One bushel of shelled corn is 60 pounds, corn in the ear, 70 pounds to the bushel. This in most states, though in various states of the Union it is 68 to 72 pounds. Shelled corn per bushel from 54 to 58 pounds, in most states 56 pounds. To measure corn on the cob in cribs multiply the length in inches by the breadth in inches, and that again by the height in inches, and divide the product by 2,748 (the number of cubic inches in a heaped bushel), and the quotient will be the number of bushels of ears. Take two-thirds of the quotient for the number of bushels of shelled corn. If the bin is circular or has flared sides all that is necessary is to compute the number of cubic inches and proceed as above.

CROSS BRED HENS

In reply to "Farmer" who inquires about cross-bred hens, I will say that my experience is that crossing breeds is not advisable either in poultry or other livestock, says a writer in the National Stockman and Farmer. Whenever two breeds are crossed uniformity is sacrificed and nothing is given in return. The breeder of full-blood animals or poultry has some object in view, such as in poultry either to produce a strain of birds that will produce the largest and best carcass; or else he may be breeding for fancy points that are not interesting or profitable to the poultryman who is interested in egg production as a source of revenue. We have never had experience with crossing the Brown Leghorn and the Rhode Island Red as "Farmer" suggests, but we have had experience with Brown Leghorns and Silver Laced Wyandottes and their crosses and find all of them good egg producers. The crosses are no improvement over the full-bloods of either. I know of some Rhode Island Red flocks that make good records as egg producers and as they are of good size I can not see any advantage in crossing the breeds.

The larger breeds will most likely consume more feed for the number of eggs produced but the main point in getting eggs is careful culling and good feeding. An old hen will not produce many eggs no matter how well she is fed and cared for.

Young hens will pay well for care and feed, but if they do not get good treatment they will not produce much profit. We kept a few white guineas for several years but in the course of time we got some pearl guineas and the result of the first cross was a pretty uniform guinea with white breast, a few white feathers in the wings and the balance of the body color of the pearl guinea. Further crossing of these cross-bred guineas produced some white guineas, some pearl guineas and some of all kinds of mixed colors, so that there was no uniformity of color after the first cross. It is very much the same with other cross breds, and so if a person undertakes to produce cross-breds he must be at the expense of buying pure breds continually for producing the crosses, so it is not economical on this account.

POULTRY LICE REMEDY

A remedy for poultry lice was developed by the Connecticut station. It is a mixture of one part of mercurial ointment, also called "blue ointment," and one or two parts of vaseline. These are mixed thoroughly, and a bit the size of a pea is rubbed onto the fowl under the wings and about the vent. It is not necessary, nor even desirable, to rub it over the entire fowl as the chicken lice are restless insects and in crawling over the

Lactein

Ask Your Poultry Supply Dealer for

Lactein Condensed Buttermilk

fowl are sure to get into the mixture. This remedy is cheap, efficient and easily applied.

Another good mixture for killing lice is called Lawry lice powder. It consists of two parts gasoline mixed with one part crude carbolic acid. Plaster of paris is then worked in until all the liquid is absorbed. This is allowed to dry and is then rubbed onto the fowls.

To destroy lice in the poultry house, spray with kerosene or, better, crude petroleum. Make three applications about a week apart, and follow with air slaked lime.

One important condition in controlling chicken lice is to give the fowls abundant opportunity to dust themselves. For this purpose, dust, air slaked lime, ashes, or any light, dusty material is suitable. Fresh, slightly damp (but not wet) earth in which to scratch or dust should always be available.

CALIFORNIA EGG LAYING CONTEST

The eleventh week of the contest saw quite a number of new hens getting back into laying after their siege of molt. Mr. Walls of Petaluma had a close competitor in the Enterprise Poultry Ranch of Chino this week and lost to them on the last day when they came through with a perfect score of ten eggs, making them 53 eggs for the week against his 50. High records are as follows:

Leading pens to date: D. B. Walls, Petaluma, 442 eggs; W. J. Neef, Santa Cruz, 398; B. F. Rose, Santa Cruz, 373; Enterprize Poultry Ranch, Chino, 357; C. T. Brown, Santa Cruz, 328; S. L. Gibson, Santa Cruz, 316.

High individuals to date: No. 16, D. B. Walls, Petaluma, 67 eggs; 272, Hollis Peck, Santa Cruz, 58; 292, G. G. Barker, Santa Cruz, 57; 18, D. B. Walls, Santa Cruz, 57; 177, R. C. Gibson, Newhall, 56.

High pens for week: Enterprize Poultry Ranch, Chino, 53 eggs; D. B. Walls, Petaluma, 50; Bellow Bros., Lakeside, 45; B. F. Rose, Santa Cruz, 44; A. W. Amsbaugh, Santa Cruz, 43; Mrs. M. B. Wilson, East San Diego, 42.

EXTERMINATING HARMFUL ANIMALS

Livestock and wool valued at $20,000,000 are l st annually through the depredations of wild animals. The value of farm produce and forage destroyed each year by rodents is approximately $300,000,000. It is estimated that the households of this country sustain an annual loss from rats and mice of $200,000,000.

These figures sum up certain of the larger losses due to destructive wild life which the biological survey is engaged in reducing as rapidly as possible. A force of between 400 and 500 experienced hunters was employed by this bureau during the past year to kill predatory animals, many of which were infected with rabies; this disease often is spread from the wild creatures to domestic animals and frequently endangers humans. In this work of extermination the states and numerous private organizations have had an important share.

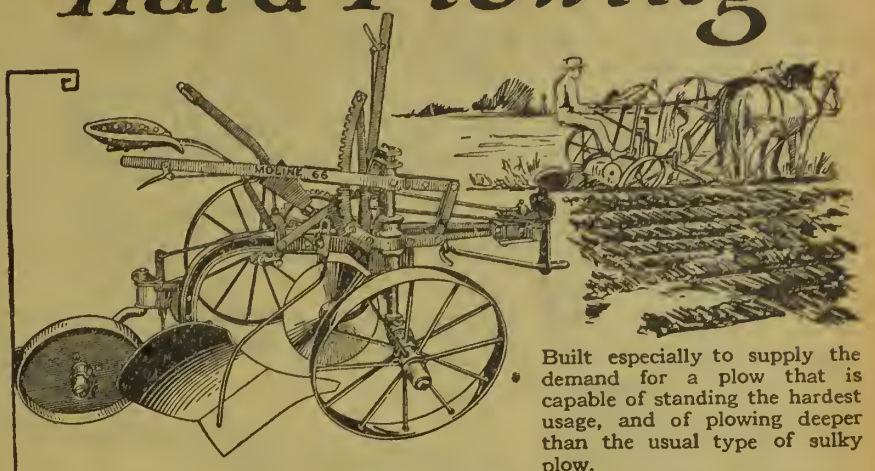
The work of killing rodents—prairie dogs, ground squirrels, jackrabbits and cottontails, pocket gophers, native mice, wood rats, cotton rats, etc.—is also carried on with the cooperation of the states. During the past fiscal year ground squirrels were poisoned on more than 14,000,000 acres. In one Idaho county alone 40,000 rabbits were killed. In the same period from 75 to 95 per cent of the prairie dogs found on a total of 2,200,000 acres was destroyed.

County Agent H. C. Heard of Maricopa County, Arizona, is cooperating with Professor D. A. Gilchrist of the United States biological survey in a campaign for the extermination of gophers. Considerable damage is done by gophers, particularly to ditch banks and fruit trees, and they believe that by a concerted effort a campaign will result in considerable saving to the farmers of the Salt River Valley.

The Wyoming ground squirrel is rapidly extending its range southward and becoming a pest throughout northern Colorado.

Over 50 per cent of the lumber supply of the United States is located in the Pacific Northwest. Over half of this is Douglas fir.

For Extra Deep and Hard Plowing



Built especially to supply the demand for a plow that is capable of standing the hardest usage, and of plowing deeper than the usual type of sulky plow.

MOLINE "66" SULKY

Has a range of adjustment for the wheels which will allow it to plow 11 inches deep This is made possible by using in the construction a very high beam, very high throat and by providing ample lever adjustment for the wheels. Moline "66" Sulky is particularly adaptable for dry farming regions and for plowing for root crops such as sugar beets.

A guiding lever operates both the hitch and the furrow wheel—this gives the operator the means for holding the plow to the proper amount of land through varying soil conditions. By means of the dial hitch the draft is applied through the draft rod directly to the beam.

The Moline "66" Sulky can be equipped with a great variety of either Moline Acme Steel or Moline Chilled Bottoms for good work in any kind of soil. All styles of bottoms in 12, 14 and 16-inch sizes are interchangeable on the same frame.

California Shorthorn Breeders

THE rapidly growing interest in pure bred Shorthorn cattle in Callfornia is shown by the numerous inquiries received by the California Shorthorn Breeders Association from prospective entrants into the business of brecding Shorthorns. Indications are that many farmers and orchardists will attend the fourth sale of Shorthorns to be held February 25 at the university farm, Davls, ln connection with Stockmen's Week. That sale probably will bring about the establishment of a number of small herds of Shorthorns.

There will also be present at the sale breeders from all parts of the state seeking choice stock to improve their herds.

It will be recalled that Little Sweetheart, grand champlon cow at the Chicago International Livestock Show, was purchased at the first sale of Shorthorns in 1918 for $425. It is improbable that her present owner, T. S. Glide of Davis, would take $10,000 for Little Sweetheart today. The sale on February 25 will include a half brother of Little Sweetheart.

In its announcement for the sale, the California Breeders Association says:

"The seasonal demand for bulls has been taken into account by the consignors to our fourth sale of Shorthorns.

"Attention is called to the superlative breeding of a number of the entries, and there are several bulls in the group fit to grace any pure bred herd. The needs of the range man, too, have been considered and there can bc found in the offering bulls old enough for immedlate service, or younger animals which can be carrled along for a few months until required.

"In attending this sale an opportunity ls offered visltors of participating in the lnteresting program prepared by the university farm authorities, a fund of attractlons havlng been provided of lnterest to the range man, the sheep breeder and the producer of swine.

"The announcements contained in the catalogs of our former sales have each drawn attention to the prospective era of development of the pure bred livestock industry in California. Each successive month confirms this analysis of the situation.

"It is eloqucnt to note that the permittees from Fresno County ranging in the Sierra Natlonal Forest have unanimously approved a regulation preventing the entry of any other than pure bred bulls of a recognized beef strain into the forest. This plan must of necessity be followed by similar action in the other forests, and the question immedaitely arises—from what channels of supply can this greatly augmented demand be filled? The solution is simple. Only by the establlshment of greater numbers of pure bred herds can the supply be increased and the demand, in more or less degree, be filled.

"Intelligent producers of pure bred cattle need have no fear for the future, and moreover have the satisfaction of knowing that besides embarking on a business enterprise susceptible of gratifying pecuniary success, they are assisting also in the development of California's greatest industry."

Speaking of the cattle he is sending to the sale, W. M. Carruthers, of the Carruthers Farms at Llve Oak, and one of the best known breeders in the state, sald:

"The six bulls and four heifers we are consigning are the best lot we have ever sent to a combination sale.

"The bull Clarlon was two years old last December and has an unbroken Clara pedigree. His half-brother won the yearllng class at the last Kansas City Royal. Hls sire is a grandson of Whltehall Sultan, the maln herd bull at John Thompson's Farm, Dover, Kansas. This is a real herd bull with a great heart girth, a beautiful roan

CONCERNING THE FIELD NOTE

A letter from a livestock advertiser:

Publishers of California Cultivator:

Gentlemen:—I herewith enclose my check to cover recent statement for advertising. Speaking of advertising, I am pleased to note the conservative way in which the Cultivator is handling its livestock advertising. I do not know how other livestock breeders feel, but I for one find it difficult to swallow a lot of the so-called field notes that constitute the principal reading material in many of the Eastern papers, and not a few of the Western papers. They all seem to be written in superiatives indicating that each man has the best of his breed. At least they are confusing and to me they serve to detract from the value of the advertisement. What I like to see is well written news and I have never felt that a lot of hot air stuff would attract the kind of patronage that I seek. Such publicity must surely cheapen the breeder's business.

* * * *

The Cultivator very much appreciates the above letter for the reason that the writer, who happens to be a prominent livestock man of this state, brings up a point on which this organization has some very definite notions, and it serves as an excuse for stating our position to both the advertiser and the reader.

The California Cultivator is dedicated to the cause of better agriculture and it is our ambition to touch as many phases of agriculture as possible and to assist in whatever way we can to build up and make strong this great industry. As part of the program better livestock will naturally have a very definite and important part. We expect and will depend upon the support of our readers and our advertisers to just the extent that we deserve. If at any time we are found derelict in our duty; if at any time it appears that we are putting our own interests to the fore, to the detriment of the industry we seek to serve, we will expect to receive substantial rebuke.

On the other hand if it ever becomes necessary to seek support on a basis where the advertiser expects the California Cultivator to prostitute its columns on behalf of any advertiser to the extent of publishing a lot of pure guff concerning his herd or flock, that advertiser will not be solicited for business.

The men responsible for the California Cultivator believe in the economic importance of better livestock. They believe that better livestock is fundamental to a prosperous and permanent agriculture. They believe that the trend toward a higher average quality of livestock is constant and inevitable and that the whole movement should be anchored on the firm foundation of the general acceptance of that primary importance rather than upon the flimsy and unstable basis that the production of registered livestock is a game for the speculator to be aided and abetted by that slap-stick form of publicity commonly known as the "field note."

We regard the field note as an illegitimate offspring of an antlquated type of agricultural journalism that is fast being relegated to limbo at the demand of the big, clear-visioned livestock producer who believes in the dignity of his business and its strength to stand alone—without the aid of such far fetched bolstering up.

At the same time we recognize the importance of live news as a stimulus to the business and an effective form of propaganda, and we will continue to print the news that we feel will be of interest and help to our readers. We will not, however, reflect upon their intelligence by introducing the slap-stick variety, written in jazz time and as an excuse for passing the hat.

R. P. ROYCE, Livestock Editor.

SANTA ANITA RANCHO

Anoakia Breeding Farm

Arabian-Thoroughbreds

Out of our choicest thoroughbred mares and sired by our famous imported stallion Ibn Mahruss we are offering some splendid two year olds. Also some especially desirable young saddle stock sired by Ibn Mahruss, world renowned Arabian desert stallion and Don Castano, five gaited saddle stallion, winner in many prominent shows.

Mammoth Jacks

We have for sale a number of two and three year old jacks, big, growthy fellows of exceptional breeding and quality.

Poland China and Berkshire Boars

Sired by the World's Fair winners, BANKER'S BOY and KINTYRE LAIRD, and by others of our herd boars of equal breeding.

Facts in BLACK & WHITE

Ten Pure Bred Holstein Cows Against 20 Scrubs

Two neighbors, on adjoining farms—one milks 20 scrub cows—the other 10 pure bred Holsteins. They care for their cows in the same way; they get almost the same amount of cream and the same sized check from the factory where both sell their milk. Though both men take in the same amount of money, the man with the scrubs uses the whole of his receipts to pay running expenses, while the Holstein man lays aside nearly half. Another item: The Holstein man feeds his skim milk to purebred calves; the other man feeds his to scrub calves. It costs no more to raise a $100.00 pure bred than to raise a $30.00 scrub.

Beef Cattle Specialist

For 30 years I have been devoting my entire time to pure bred beef cattle. I know the kind of cattle California needs and where and how to buy. I make regular trips to the great producing centers and will buy on order. Best of references. Satisfaction assured. Correspondence invited. R. M. DUNLAP, Hotel Land, Sacramento, Cal.

DIAMOND G HEREFORDS

are the kind that make good under all conditions. They have the size, bone and constitution that the range operator wants. Herd headed by Don Perfect 2d, one of the best bulls in the West. Correspondence invited and visitors welcome.

H. H. Gable Esparto, Calif.

with a fine breeder's head. He is thick and close to the ground.

"Live Oak Glory 5th is red with white feet and has a Clara Victoria pedigree. He is a full brother to the yearling heifer Mr. Bond paid $1,850 for at my last sale. He will make some one a mighty good herd bull.

"Villager's Stamp, a red roan from a Cruikshank and by Hallwood Villager, has an ideal head and is one of that low down blocky kind the breeders like to see. He resembles his sire very much but will make a better show bull. It will take a good yearling to beat this bull at the shows this year.

"Villager's Duke, a Cruikshank Orange Blossom, is much like his stable mate, Villager's Stamp. He is a nice roan, wide and low down, also sired by Hallwood Villager. Ruth's Count and Signet's Count are two good ones by Count Glory. The first named is a flashy roan with few holes in him, the kind the stockmen like. Signet's Count is of a solid red color.

"It was only with a good deal of persuasion that we consented at all to consign any heifers but to help the breed along we are sending four head, an Orange Blossom, a Secret, a Dorothea and a Red Lady. These are four elegantly bred heifers, two roans and two reds. Three of them are sired by Count Glory and one by Hallwood Villager."

The University of California offers two heifers. One is Mayflower Gloster out of Lavender Miss 2nd, she by Fond Lavender. The heifer is sired by the university farm's great white bull, Sultan Mayflower, sire of the bull California Model, which as a calf brought $5,500 at the second sale of Shorthorns in 1918. The farm's other offering is California Lady 2nd, also sired by Sultan Mayflower and out of Lady Bug 3rd, she by the Clark bred bull, Noble Knight.

Eaton and Ward, Blackhawk Ranch, have entered four bulls. These are Blackhawk Favorite, sired by their head breeding bull Roan Radium and out of a Violet Leaf cow; White Emblem, sired by Pride's Emblem, he by Village Pride; Belle's Sultan, grandson of Whitehall Sultan and out of Knight's Lady Belle; Pride's Emblem 2nd by Pride's Emblem, out of a Clara cow. The first two named have six crosses of Cruikshank strains, while Pride's Emblem 2nd has five crosses of Marr bred Claras in his pedigree. Three of these bulls are full two year olds.

SHORTHORN TYPE THAT COUNTS

(Continued from Page 241.)

of the shoulders. Note, too, the tendency to narrowness at the rump. The other shows the straight side lines and ample thickness of the perfect beef carcass. Note the width back of the hips.

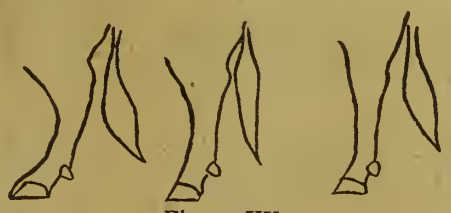

Figure XV

Figure XV shows the difference in conformation of the hind leg. Note that one is badly crooked, furnishing an inadequate support to an animal when it acquires any considerable weight. The one shown in the center approaches the correct position—not too crooked nor too straight, but designed to furnish the best support and stand the necessary travel. The one at the right is entirely too straight and interferes with the proper movement when in action. The tendency of an animal of this conformation when it becomes heavy is to buckle forward.

I offer these few suggestions in the hope of enabling the readers of this magazine, who may not be skilled bovine critics, to more readily discern the peculiarity of animal form. These by no means cover the ground fully, but they draw attention to a few fundamental characteristics that everyone interested in livestock improvement must understand. It is a good practice to make comparisons of animals wherever found. When looking through a herd take time to note the difference in conformation. It is always an interesting study, and a profitable one if you have money invested in the business. An experi-

More Milk and Easier Milking!

—Care of the Udder Insures It.

It is impossible to obtain a maximum milk-flow from an udder that is not entirely healthy both inside and out. The slightest hurt or congestion will interefere with the delicate milk-secreting process, and at once reduce the production of an otherwise healthy cow.

Bag Balm has the soothing, healing, and penetrating qualities needed to make the tissues and surface of the udder soft, smooth and pliable—easy to milk and encouraging production to the last ounce.

A little care pays big returns; keep Bag Balm on hand and insure against milk losses and disagreeable milking. Especially valuable in treating Caked Bag, Cow Pox, Chaps, Bunches, Wounds and any inflammation.

Sold by druggists, feed dealers and general stores, in liberal 60c packages. Be sure to obtain a package at the first opportunity. It's a little wonder-worker in any udder trouble. A great remedy at the calving period, when so many abnormal udder conditions arise.

DAIRY ASSOCIATION CO., Lyndonville, Vt.

BAG BALM

MADE BY THE KOW-KURE PEOPLE

"FEEDFINE" FEEDS

are scientifically compounded in proper proportions for dairy and all livestock feeding, of the following ingredients with the most economical results always in view.

YEAST — A concentrate high in PROTEIN and FAT content, sterilized and predigested.

CANE MOLASSES — The richest of feeds in carbohydrates—produces increased appetite on account of its palatableness. Its consumption results in increased energy and it is the best tonic known for animals.

ALFALFA MEAL — Gives body to the ration and supplies the mineral matter which is absolutely essential to all animals.

The greatest known combination for health, strength and productiveness.

enced judge will, at one quick glance, detect the defects and strong points of the animals composing a group. An inexperienced person may spend hours among them without observing these defects. It is this ability to observe that makes a man skillful in his judgment. Here is an interesting feature: that the more skillful one becomes the more readily one detects the different characteristics, the more deeply interested one becomes in animal improvement.

The California farm bureau marketing association has issued a calendar which gives the dates of all hog sales to be held by the association during 1920, with names of the local managers of the farm bureau, the auctioneers, and the officers and directors of the marketing association.

HEREFORDS

30 Females---At Public Auction---40 Bulls

University Farm, Davis, Cal.

Tuesday, February 24, 1920, at 1 P.M.

An offering by leading Pacific Coast breeders in which the females are of high character and breeding, and those in calf are bred to the outstanding sires of the West. Especial thought has been given to the needs of the rangeman in the bulls to be sold, and the result should prove attractive to range buyers.

HEREFORDS ARE SAFE CATTLE

The comparative freedom of HEREFORDS from some of the more serious cattle diseases, and their firmly established ability to successfully withstand the hardships of winter and the droughts and resultant scant feed of summer, contribute largely to the tremendous popularity the whiteface breed has earned throughout America. Their dependability on the range and in the feed lot has created a sound and dependable demand for registered HEREFORD breeding animals, and the purchase and development of such animals in one of the safest investments in the agricultural field today.

The cattle in this sale represent the breed families that have played a large part in establishing HEREFORD quality, and the consigning breeders are offering only such individuals as they believe will prove satisfactory and profitable in the hands of new owners.

In the Western Hereford Breeders Association sale held at Denver, January 21, during the National Western Livestock Show, R. C. Jacks of Monterey, who has been a very heavy purchaser of Herefords the last few months, paid $4,000 for Ruth Domino, the January 1919 calf that was made junior and grand champion at that show. Ruth Domino was sired by Prince Domino, the bull that made a record on his get at the Denver show. In the same sale five sons of Prince Domino averaged $3,370 and three daughters averaged $2,142. Prince Domino was sired by Domino by Publican and out of a Beau Brummel dam. Other purchases made at Denver by Jacks include two two year old bulls and two heifers.

California Hereford breeders will be interested to know that Miss Rialto 2nd, champion Hereford female at the 1918 Los Angeles show and again at the 1919 Los Angeles and San Francisco shows, has been sold by her breeders, the Hereford Corporation of Wyoming, to Senator J. N. Camden of Kentucky for $10,000. She was recently senior champion at the Denver show.

Announcement has just been made by C. L. Hughes of the California Breeders Sales and Pedigree Company, Sacramento, that on April 21 he will sell at public auction 100 head of registered Holstein heifers and 20 registered bulls from the herd of the Bonita Stock Farm. The heifers are said to represent one of the most attractive lots to be sold in some time, and range in age from calves to bred heifers. The sale will be held on the Bonita farm.

The Henderson Company of Sacramento has recently sold 23 daughters of their herd bull, King of the Black and Whites, to S. O. Walker of Visalia. By this purchase Mr. Walker secured a particularly desirable foundation herd.

At the National Western Livestock Show the grand champion carlot of bulls was won by yearling Herefords. They sold for $600 around. The champion load of females was won by yearlings and they were sold for $1,000 around. Sixty-five carloads of breeding cattle were exhibited.

The interest now being accorded Hereford cattle in this state is indicated by the extreme demand for catalogs and information concerning the sale to be held under the auspices of the Pacific Coast Hereford Breeders Association at the university farm, Davis, February 24. The sale, which is to be managed by C. L. Hughes of the California Breeders Sales and Pedigree Company, Sacramento, will consist of 40 bulls and 30 females from the following breeders: Chas. Rule, Duncans Mills; W. J. Bemmerly, Woodland; University of California, Davis; University of Nevada, Reno; John H. Cazier & Sons, Wells, Nevada; W. D. Duke, Gazelle; John A. Bunting, Mission San Jose; H. M. Barngrover, Santa Clara, and probably the Hereford Corporation of Wyoming, Cheyenne, Wyoming.

Dr. J. P. Iverson, during his recent trip to Salt Lake City and Spokane,

in addition to attending the meetings of the woolgrowers and cattlemen's conventions, called on a number of state livestock officials and believes that it will be possible to call a conference of all officials west of the Rocky Mountains this summer. During the last few years many new problems have developed which are proving very difficult to handle, due to lack of uniformity of methods and policy, which it is believed could largely be corrected by a meeting of these officials.

The fourth semi-annual sale of the California Shorthorn Breeders Association will be held at the university farm, Davis, February 25, during the Livestock Week. Forty head of bulls and 20 females will be consigned from the following herds: W. M. Carruthers, Live Oak; Caledonia Farms, West Sacramento; Dr. H. M. Elberg, Woodland; Thornton S. Glide, Davis; university farm, Davis; Blackhawk Ranch, Diablo; Ormondale Farm, Redwood City; Pacheco Cattle Company, Hollister; Fair Oaks Ranch, Willits; G. A. Murphy, Perkins; H. L. & E. H. Murphy, Perkins; Chas. A. Trosti, Vinton. The bull end of the offering is said to be particularly attractive and of a class that will meet the needs of the range men and many breeders. Not a few of the bulls are sired by the leading sires of the West and many of the females are either sired by or carry the service of the best bulls owned in California herds.

H. W. Rice, Paia, Maui, Hawaii, has purchased from Steybrae Farm of San Mateo, the Ayrshire cows Maple Leaf Lily, Steybrae Anne, Steybrae Jeanie Deans, Sunnyside Gouverness and Willowmoor Happy Girl. Maple Leaf Lily is a sister to the famous show cow, Maple Leaf Jean, now owned by Capt. A. Henry Higginson of South Lincoln, Massachusetts.

Epochal, the noted English bred Berkshire boar that has been at the head of the herd owned by the Gossard Breeding Estates, Martinsville, Illinois, died recently. This boar was the cause of much discussion in the Berkshire ranks owing to the fact that he represented a direct outcross from American bloodlines. Epochal proved himself a valuable sire and has left a strong impression on the breed.

In referring to the recent purchase of Shorthorns made by Dr. H. M. Elberg, Roselawn Stock Farm, Woodland, the Breeders' Gazette says: "H. M. Elberg, Woodland, has selected from the Hopley Stock Farm, Atlantic, Iowa, 10 females, including the red Select Beauty by Selection by Whitehall Sultan, with a roan heifer calf at side by Village Beau, at a cost of $5,000. At the same figure he secured the roan Ravenwood Lady by the Gentry-bred Wooddale Stamp, with a roan bull calf at foot by Village Beau. The roan Village Queen with a heifer calf by Village Beau and two Village Beau yearling heifers also were purchased."

The Sonoma County Fair Association has been organized by the following incorporators: J. Francis O'Connor, Castleview Ranch; Thomas Harrison, L. L. Cannon, P. W. Bussman, Sheridan W. Baker, Ida D. Pyle, John T. Summers, Al Trembly and E. A. Vaughan. The directors are planning to lease the old Santa Rosa stock farm for a fair grounds.

One offering at the Western Berkshire Congress sale, to be held at Davis on February 17, is Wilsonia King Laurel, consigned by the Sandercock Land Co. He is the 800 pound boar that is a litter mate to Real Type, claimed to be one of the greatest boars in the world. The only time these two boars were shown Wilsonia King Laurel defeated Real Type. The Sandercock Land Co. sold a full sister to this boar to the Italian Vineyard Company for $500. The boar is two and one-half years old, and was one of a litter of seven that was shown, all of which have been sold for high prices and are in some of the best herds in the United States.

FOUR STATES IN BERKSHIRE CLASSIC

The following program has been announced for the annual meeting and sale of the Western Berkshire Congress to be held at the university farm, Davis, Tuesday and Wednesday of next week: 10:00 A. M., students judging contest; 11:00 A. M., women's judging contest; 11:30 A. M., judging sale hogs; 1:30 P. M., annual congress meeting; 7:00 P. M., anual banquet, Traveler's Hotel, Sacramento.

Wednesday will be occupied with the sale of 40 bred sows and gilts from the following herds: Anchorage Farm, Orland; Frank B. Anderson, Sacramento; Calac Orchards, Martinez; Castleview Ranch, Santa Rosa; E. J. Ferguson, Santa Rosa; R. C. Gruhlke, Dixon; A. B. Humphrey, Escalon; Italian Vineyard Company, Guasti; Kounias Registered Stock Farm, Modesto; Will Long, Orland; R. J. Merrill & Son, Morgan Hill; H. C. Muddux & Son, Sacramento; Walter Olsen, Chimacum, Washington; W. F. Sandercock, Sacramento; Silver Glenn Stock Farm, Silverton, Oregon; C. P. Warwick & Son, Pleasant Grove, Utah; George M. York, Modesto and D. J. Bastanchury, La Habra.

According to Secretary Anderson the offering is the most representative of the best Western herds that has ever been sold through a congress sale.

TOYON HOLSTEIN SALES AND RECORDS

In a recent letter from Horace L. Hill of the Toyon Farm Association, he writes:

"We wish to report the recent sale to A. E. Smith of Sumas, Washington, for $4,000, of a son by Judge Segis and out of Ava Model Hengerveld 2nd who had completed a record of 1,129.37 pounds butter from 25,874.1 pounds milk in 365 days. We now have in our herd five daughters and granddaughters of this cow and a 30 pound sister by the same sire. We regard this as one of the greatest foundation families of our herd and intend to develop fully all these animals in long time work. A daughter of Ava Model Hengerveld, freshening with first calf, last April as a junior two year old, made a record of 17.72 pounds butter from 401.5 pounds milk in seven days and continuing on semi-official test now has to her credit 550.73 pounds butter from 12,639.0 pounds milk in 255 days. A granddaughter, Korndyke Model Hartog 3d, made as a junior two year old a record of 23.77 pounds butter from 490.4 pounds milk in seven days and now has to her credit about 586.64 pounds butter from 13,850 pounds milk in 244 days.

"We have also sold to the Whittier state school a son of our Finderne Soldene Valdessa out of Valdessa Clarkhurst Pietertje 2nd who has a junior three year old record of 25.78 pounds butter from 507.4 pounds milk in seven days. Valdessa Clarkhurst Pietertje 2nd has again freshened and will probably be run for 305 days. This young bull is particularly strong in the blood of Valdessa Scott 2nd, the first 41 pound cow, tracing to this great animal through both his sire and dam.

"During the past few months we have completed in addition to those mentioned above the following seven day records: Dominita Clem De Col 3d at seven years—butter 31.48 pounds from 486.2 pounds milk; Finderne Jondine Pontiac at three and one-half years—butter 25.87 pounds from 461.3 pounds milk; Pearl De Kol Netherland 5th at eight years—butter 27.96 pounds from 556.2 pounds milk; Yuba Dam at eight years—butter 23.35 pounds from 547.6 pounds milk; Evelyn Princess Pontiac at seven years—butter 24.45 pounds from 521.5 pounds milk."

DUROC-JERSEY SALE

The Fresno district Duroc-Jersey Breeders Association held its first sale in Fresno February 4. The top of the sale was Brookwater Fashion 2nd from the consignment of J. P. Mallory, selling to C. E. Ellis, Visalia, for $225. The prices for the other animals sold ranged from $60 to $200. The attendance was not as large as had been expected and the buyers seemed undecided as to the future of the hog business. However, the breeders, while realizing that the animals did not bring their real value, announced that they would hold another sale in August. The offering in this sale was attractive, in fact, better than is usually found in the first consignment sale of like organizations. No doubt by the time they hold their next sale market conditions will have improved to such an extent that their offering will be readily absorbed.

SHIRES TO THE SOUTH

E. Lovell, manager of the Blackhawk Ranch, Contra Costa County, recently delivered ten pedigreed Shire mares and Lightsome's King, a young Shire stallion, to the Fred H. Bixby Ranch in Los Angeles County. Among the bunch of mares were some first prize winners at recent state fairs.

Mr. Bixby is the largest breeder of pure bred horses south of Tehachapi, and recent introductions from the Mount Diablo Ranch will enable Mr. Bixby to make some fine entries at next fall's fairs and shows.

Dairymen of the Riverside County farm bureau have been hearing this week talks on feeding by Profs. Voorhies and Thompson of the state university. A meeting was held at Fruitvale Thursday on the ranch of A. M. MacKersie; another at Arlington Friday on the ranch of George Thomas midway between Arlington and Corona; a Saturday meeting (today) at Hall Brothers ranch, Perris—subject, hogs.

ABSORBINE

WHAT PERCEHERONS HAVE DONE FOR ONE IOWA FARMER

That there is satisfactory money in the pure bred draft horse business and that no great outlay of cash is needed is indicated by the experiences of C. F. Curtis of Ames, Iowa, who says:

"Rookwood Farm consists of a half section, about one-half of which is in wooded pasture land. The balance is tilled for crops. Twelve years ago, I stocked the farm with four Percheron mares, two imported weanling filleys, and one pair of medium weight geldings. The total outlay for horses at that time was $2,185. I have made no expenditures for Percherons since, and three animals of the original purchase are still in service on the farm. Two and one-half years later I disposed of two of the less desirable mares and replaced them with younger stock raised on the farm, without additional cash outlay.

"The policy has been to maintain just enough brood mares, in addition to the pair of geldings, to do the farm work and to breed the mares to the best stallions available. The present stock consists of six head of brood mares, two geldings, and two colts. The total sales of colts during the 12 year period amount to $8835. All colts have been sold under two years of age, and four of them were sold under one year of age. Two mares have died during the 12 years, and one colt was crippled and of little value.

"As an indication of the value of a good sire, two colts were sold at one year of age in succeeding years, from the same mare, both sired by imported sires, but one sire was very much superior to the other. The colts were equally well grown, and in good condition at time of sale. One of them sold for $350 and the other one for $1000. The total sales for colts from these horses might easily have exceeded $10,000 if a better sire for mating the mares had been available during the earlier years."

PROGRAM FOR STOCKMEN AT UNIVERSITY FARM

Arrangements for "Stockmen's Week" at the University of California farm, Davis, the last week of February, will include a series of important meetings of cattlemen, swine breeders and dairy farmers, and auction sales of pure bred Shorthorn and Hereford cattle, Poland China hogs, and bulls of the main dairy breeds, on the afternoons of February 24 to 27.

Addresses by well known speakers on the subjects of cow testing associations, cooperation among dairy farmers and the present dairy situation, are scheduled for Friday, February 27. Demonstration of representatives of the different breeds in the University of California dairy herd will follow in the afternoon of the same day. An important address on the "Better Sires—Better Stock" movement inaugurated by the federal department of agriculture, and a discussion on important points in a good dairy bull, which will directly precede the auction sale of pure bred dairy bulls, are also on the program.

Dairy farmers throughout the state have been invited by Dean Van Norman to attend the university farm "Stockmen's Week" ceremonies, and especially February 27.

DAIRY HEIFERS OFTEN NEGLECTED

Raising dairy heifers from weaning time until ready to calve is generally considered easy—so easy, in fact, that they are often neglected, says Chas. W. Turner of the dairy department of the University of Missouri. A heifer stunted by the lack of suitable feed will never develop into as good a cow as one kept growing from birth to maturity. During the summer while the young animals are on pasture not much attention is needed, as pasture grass furnishes the best and cheapest feed available. Shade and an abundance of fresh water are two essentials which the careful herdsman always provides. In the winter it is not necessary that a heavy grain ration be fed if suitable roughages are at hand. Corn silage and legume hay make an excellent combination. With this combination of roughage and succulence satisfactory results can be obtained with a minimum amount of grain.

The most satisfactory ration of all tried in a recent experiment at the Missouri station was silage at will, legume hay, clover or alfalfa, limited to about six pounds daily and two pounds ground corn daily. On this ration heifers of all ages thrived and made gains above normal.

When the well grown heifers are from 16 to 20 months old they should be bred to the best pure bred dairy sire available. A winning combination for dairy improvement and success lies in a bred-for-production bull mated with home grown heifers. As the time for calving approaches the heifers should be brought in and conditioned for the strenuous lactation period to follow. It has been shown repeatedly that fat on a heifer is soon milked off. Professor Eckles was first to show that a cow in good condition will test higher during the first part of her lactation period than one in thin flesh. The breeder can use this fact to advantage in preparing the heifers.

If it is possible, the breeders of pure bred stock should place their heifers on official test, as it has been found that heifers with first calf make the requirements for advanced registry or registry of merit the easiest. It also gives the best indication of progress made in breeding for production.

STERILIZING THE MILKING MACHINE

The use of milking machines is increasing and at the same time difficulties are encountered in obtaining a low count milk when these milking machines are used. It is frequently claimed that all that is necessary to do is to place them in a disinfecting solution, but Chester F. Hoyt of the dairy inspection service of the state department of agriculture says that experience shows that this is not sufficent. Some progressive dairymen have found that by first washing the tubes well and then by placing them in water and bringing the water to nearly boiling point or up to say 170 degrees and leaving the tubes in this water until ready for another use, satisfactory results may be had.

STATION BEGINS CATTLE FEEDING

According to Dr. R. H. Williams, animal husbandman of the college of agriculture, the university of Arizona just purchased 36 steers and placed them on feed on the Mesa Experimenal Farm in the Salt River Valley. Twenty-seven of these were cross-bred steers sired by a Polled Shorthorn bull and nine of them were high grade Holsteins. They were all valley raised and in fairly good condition, averaging 889 pounds at about 30 months' old. These steers were divided into six different lots, each containing six animals as nearly alike as possible except Lot 1 contained high grade Holsteins. They are to be fed as follows:

Lot 1—Alfalfa hay ad lib.

Lot 2—Alfalfa hay ad lib.; and silage ad lib.

Lot 3—Silage ad lib.; cotton seed meal, 3 pounds.

Lot 4—Silage ad lib.; cotton seed meal, 3 pounds, alfalfa hay ad lib.

Lot 5—Silage ad lib.; cotton seed meal, three pounds, ground milo maize, six pounds.

Lot 6—Silage ad lib.; cotton seed meal, three pounds, ground milo maize, six pounds, alfalfa hay, ad lib.

The test will run for two months and possibly longer. Much will depend on the condition of the market. It is hoped to be able to secure sufficient data with this feeding test to indicate the rate of gain, length of time required to finish cattle, cost of grain, the effects of the different rations and other information regarding the cattle feeding business which will prove valuable to stockmen.

VALUE OF PURE BRED BULLS

The first cross of a pure bred bull on the average dairy herd increases the income $32 per cow. These figures were secured in the province of Ontario in a comparison of 140 herds using grade bulls and 31 using pure breds. Rex. E. Willard, of the farm management department of the North Dakota agricultural college, in applying these figures to North Dakota, shows that if one farmer with 20 cows using grade bulls received an income of $1680, his neighbor with 20 cows but who began using pure bred bulls five years ago should receive $2320 or $640 more.

DE LAVAL
Cream Separators
are the cheapest as well as the best

This is the unanswerable argument in favor of the purchase of a DE LAVAL Cream Separator.

Everyone wants the best, provided its cost is within his means. Fortunately a DE LAVAL costs but little more than an inferior cream separator and saves that difference every few weeks.

Moreover, an inferior separator wastes in time and labor, and in quantity and quality of product what a DE LAVAL saves, and goes on doing so every time it is used, twice a day every day in the year.

If you doubt this is so, try a new DE LAVAL alongside any old machine you may be using or other make of separator you may have thought of buying. Every DE LAVAL agent will be glad to afford you the opportunity to do so.

If you don't know the nearest De Laval agent, simply address the nearest De Laval main office, as below

The De Laval Separator Co.

LAST CALL

FOR THE

Western Berkshire Congress

Annual Guaranty Sale

University Farm - Davis, Cal.

February 18, 1.30 P.M.

30 Bred Sows and Gilts
5 Young Boars

Nineteen breeders from four states are making up an offering, exceeding in excellence any consignment sale heretofore held by the Western Berkshire Congress. The object of these sales is to afford the farmer and beginner an opportunity to buy at their own prices, foundation animals of proven blood-lines and the kind of individuality that will produce a better hog.

Every female in the sale is bred and guaranteed to be safe in pig.

Farmers and breeders are invited to participate in the annual congress meeting, show and sale, commencing on Tuesday morning, February 17, at the University Farm, Davis, and continuing all day with a banquet in the evening at the Travelers Hotel, Sacramento.

The sale on the afternoon of Wednesday, February 18, will be last on the program.

Hereford Points and Pointers

By R. R. Miller, the American Hereford Breeders Association

(From the booklet "Hereford Cattle" published by the American Hereford Breeders Association.)

THE success which the Herefords have attained has been achieved on their proven merits. The early progress of the breed in the United States was made under severe handicaps imposed by supporters of rival breeds which were imported earlier into this country, and therefore more firmly established. At the shows and fairs no prizes were allotted to the Herefords and oftentimes exhibitors who desired to show their cattle were not even permitted on the fair grounds. When exhibitors were allowed to show Herefords they were shown in classes with the rival breeds and under judges whose sympathies lay entirely with the opposing breeds.

Even though subjected to such treatment the cattle were of such superior quality and beef type that they acquired many friends, the growth of the breed from an early date being very rapid.

The Hereford is singularly resistant to tuberculosis and other diseases prevalent among bovine stocks. Their constitution has never been impaired by inbreeding nor by excessive pampering, consequently "The Whiteface" has been found to successfully endure hardships and resist disease. Among thousands of Herefords tested for tuberculosis, "reactors" are rarely found.

Hereford cattle are ample in size. Mature bulls weigh up to 3,000 pounds, averaging 2,100 to 2,300 pounds, and mature females average 1,500 to 1,700 pounds. These weights have been determined by the actual average weight of all Herefords shown at the American Royal Stock Show for a period of five years.

Coupled with their ideals in evolving a type of cattle carrying the desired conformation and ample scale, the Hereford breeders have not lost sight of the fact that it was necessary to produce cattle of high individual quality as well as an ideal beef type.

The unerring prepotency of the Hereford to reproduce like is responsible for their wide popularity. No matter what the degree of breeding of the scrub, grade or pure bred cattle with which they are crossed, the calves uniformly bear the characteristic whiteface and desirable qualities of the breed. Just as one is attracted by a well packed box of uniformly colored and sized apples, the buyers of feeders, fat or pure bred cattle are attracted by the uniformity in markings and size of a group of Hereford cattle. Such uniformity adds dollars and cents to their value and produces a more easily salable product.

Previous to the introduction of Herefords and before their influence on the beef market had reached any importance, the most common ages of the fat cattle sold were three, four, five and six year olds. Thus the farmer's and feeder's capital was tied up for a much longer period than at present prevails, because the cattle then marketed were slower in arriving at their maturity. The increase in the population of this country, the rise in the value of the land and cost of feed, made some vital change necessary in the production of market beef. Here the Hereford stepped into its own and saved the day, for it was soon discovered that the Hereford steer would fatten and could be made ready for market at a very early age. Their propensity for early maturity won them wide favor in those times when the "Whiteface" was subjected to the most severe criticism. These qualities of early maturity are resulting in a daily increasing popularity for the Hereford breed.

Over two-thirds of the cattle on the range carry the mark of a Whiteface, which in itself shows the great confidence with which rangemen regard this breed.

The reason for the great Hereford popularity on the range is their ability to endure the hardships of outdoor weather. Not only do they withstand these hardships, but it has been found that they produce a larger calf crop than any other breed.

The same qualities which gained the Herefords their popularity with the rangemen has also contributed in a large measure to their popularity with the farmer. As a breed, the cattle are docile, easily handled, require no pampering and thrive on the waste products of the farm. Their ability to quickly and cheaply put on satisfactory gains, combined with the rugged constitution and consequent freedom from disease, particularly tuberculosis, has also contributed greatly to enhance the Hereford's standing with the owners of small herds and farmers. These farmers have seen through experience that pure bred Hereford bulls have more than paid for themselves the first year by adding $20 to $100 to the value of each steer marketed.

Because of attractive prices for pure bred Hereford cattle and the commercial demand for breeding stock, this field offers the most alluring inducements at the present time that have ever marked the progress of this great industry.

There are fundamentals that underlie the founding of a pure bred herd of Herefords that must not be overlooked. These essentials are founded first in integrity of the farmer, coupled with common sense and finances to back the undertaking.

Unless a man intends to found a herd on integrity and with an ultimate purpose, it is advisable that he sever himself from ambitions that cannot materialize in good to himself or the industry of pure bred cattle production.

There has been an ultimate and well defined purpose in the breeding of pure bred Herefords ever since the industry was founded, and that was to honestly produce the animal that would yield the most beef on the least feed in the shortest possible time.

(Continued Next Week.)

Practically Perfect

California Prime Duke, first junior yearling pure bred Hereford steer at the Chicago International, owned by University of California.

There is said to be a movement in Northern Sonoma County to withdraw and form a new county.

Land Settlement Through English Eyes

OUR readers may recall references made some months ago to the inspection of California land settlement in Butte County by a noted Englishman, Herbert E. Easton, Honorable Secretary British Immigration League. Mr. Easton was at the State Fruit Growers' Convention in November at Chico and at that time made careful study of the situation at Durham. He had hardly finished his report to his government when he was stricken and suddenly died. His report, however, has been issued, and in view of the renewed interest in land settlement as encouraged by California, pioneer state of all the Union in this movement, we quote liberally from Mr. Easton's report. First, however, let us quote from Dr. Elwood Mead a fundamental principle underlying California's effort to take the land to the people:

"'Nations may battle, and the world rock with revolution, but the land will care for him who cares for it.'"

"Realizing that the only prospect of encouraging the birth of healthy children is to provide them with an environment in which they can flourish, and knowing that the root of most of the serious economic and industrial troubles the world has to face can be traced to the congested state of cities and large industrial centers, America is today actively engaged in promoting small land ownership on a community basis."

Mr. Easton reports:

"Durham is a concrete expression of the California land settlement act, the object of which is to help people of small means to become owners of farms. It was passed because the rapid growth of alien tenantry was causing political and social unrest. It was felt that private enterprise was not doing the things that public welfare required and that as a result the growth of the country was not keeping pace with the growth of the cities.

"Under this act, the state land settlement board is buying privately owned land, cutting it up into small farms and selling these to worthy landless people on long time payments at a low rate of interest. It is giving them the benefits of practical advice and training. It is helping them to organize cooperative buying and selling agencies and in many ways saving them from costly mistakes and enabling them to become self-supporting in less time with less money or effort than is possible in an unplanned development.

"The California legislature was the first body to give government aid and direction in settlement in the United States and was regarded as an experiment. The area of land which could be bought was restricted to 10,000 acres. The first appropriation was only 52,000 pounds sterling. This is to he repaid in 50 years with interest at four per cent. Certainly the state was not overgenerous, and the board, which outside of its chairman is made up of hard headed business men who work without pay, inaugurated this experiment under rather hard conditions."

* * *

"The first step after the purchase of the land was to make it ready for settlement. To do this a soil survey was made and a soil map prepared which showed the land that was best adapted to the growing of grain, fruit, alfalfa, lucerne, and vegetables. This soil map was the foundation of the valuation of the different farms and farm laborers' allotments, and has proven of marked practical usefulness. Then a contour survey giving every change of elevation of six inches was made. It was the basis for laying out the irrigation ditches and for the leveling of the surface of the different farms so that water would flow over it evenly. Following the preparation of the soil and contour maps a subdivisional plan of the area was adopted and when the boundaries of the different tracts had been marked out and permanently witnessed by concrete posts the different farms were valued. It was necessary that the total sum received from the sale of the land should equal the amount paid for it, plus the amount that had been expended in building the irrigation system and the estimated amount of money needed to cover further expenses and possible losses.

"This has to be provided for, as the enterprise has to pay all expenses. The state gives nothing. It loans the hoard money at four per cent. The whole worked out to an average cost of 30 pounds sterling an acre and the different farms were to be valued with a view to making them all equally attractive at this average price.

"To obtain these farms, settlers are required to make a cash payment of five per cent of its cost. The remainder is paid in 40 semi-annual amortized payments of four per cent, which pays off the debt (principal and interest) in 20 years. In a later settlement, the semi-annual amortized payments are three per cent, which pays off the debt (principal and interest) in 34 years; the interest in both cases being five per cent.

"It was evident that if settlers' farms had crops growing on them they would be in a much better position to meet their payments than if they took the land wholly unimproved. The board, therefore, purchased a 75 horsepower tractor and cultivation equipment which would enable large areas of land to be cultivated and settled quickly. Using this tractor day and night with three shifts of men, more than half of the land had crops growing on it when the farms were sold.

"The California act contemplates only community development, and it is the board's intention not to purchase any areas which will provide homes for less than 100 families.

"The act provides that the lands to be allotted shall be thrown open for inspection for 30 days, during which time intending settlers can make their applications. The forms filled out give full information as to their past experience, the amount of capital and equipment they have, and state the assistance they desire. The board is authorized to lend £600 to farmers and £160 to farm laborers to be spent in the improvement of their places. The amount of capital which a settler is required to have is left to the discretion of the board. At Durham it was the board's belief that to prepare the land for irrigation, erect the needed farm buildings and buy the farm equipment would involve a minimum outlay of £900. Of this the board could furnish £600 as a loan. It held, therefore, that the settler must have the other £300, and no settler was accepted who had less than that. As the farm laborer would meet his payments from wages and would need nothing but the house, which the board could build, he was not required to have any capital.

* * *

"The settlers at Durham had an average cash capital of £600. They could borrow £600 from the state land settlement board, and this has enabled them to finance themselves without loans from outside sources.

"When the board purchased the land in the spring of 1918 no one had lived on it but tenants or hired laborers for 20 years. Now there are about 120 families with more than 200 children, all living in comfortable houses, cultivating farms that are in most cases fully improved and on which there are many dairy herds of unusual excellence. What a contrast to the menace of the slum life of the cities; and how it should encourage those who believe in an enlarged use of the state as an instrument of direct service in those things that affect the general welfare.

"The average income of settlers who have been on these farms for a year is over £400. They have met their payments to the state and they are in good condition to continue to do so. In 1919 a committee of the state legislature, after investigating the colony, reported that it was a kind of development that the state could expand indefinitely. An appropriation of £200,000 for immediate extensions was made without oppositions and a bond issue of £2,000,000 was authorized."

* * *

"The first duty of a government heing the welfare of its citizens, administrations planning extensive arrangements for the settlement of people on the land can today confidently rely on receiving public support.

Champion B-43. Price $1. for High-Powered Cars, Trucks and Tractors

Start The Season Right
Equip Your Motor With Champions

BEGIN your spring car-overhauling by putting in a set of Champion Spark Plugs. It is the first step in insuring trouble-free engine performance for months to come.

Champion Dependable Spark Plugs are recognized everywhere for their unfailing reliability and endurance.

Our famous No. 3450 Insulator and Patented Asbestos Gasket Construction make them proof against the intense heat and vicious shocks of constant cylinder explosions.

There is a Champion Spark Plug for every type of motor car, truck, tractor, motorcycle and stationary engine.

When writing advertisers, mention the Cultivator.

"As most sections of the community, including the banks and other large financial institutions, are alive to the fact that in supporting measures of this kind they are furthering the only movement that will act as an effectual antidote to the seeds of destructive poison which since the war have been so widely sown. And well known institutions such as the Young Men's Christian Association have already decided upon a vigorous campaign for the brightening and betterment of country life.

"In the near future the number of small land owners will be increased by millions, and their influence will be felt to such an extent that those whose business it is to ferment discontent will find that they have lost their chief asset, namely, people who have no interest in a country beyond a parliamentary vote."

FARM WAGES HIGHEST KNOWN

At no time have the wage rates of farm labor been as high in this country as they were in 1919, certainly as far back as 1866, when the first investigation of this subject was made by the bureau of crop estimates. Averages for the United States are in mind, and not local rates. For labor hired by the month with board, the average rate was $39.82, and among the geographic divisions the average was as low as $30.54 in the South Atlantic and as high as $62.96 in the Western, including the Mountain and Pacific states. Without board, the average for the United States was $56.29, and the lowest was $44.03 in the South Atlantic states and the highest, $87.12, in the Western. Extras, such as firewood, milk, etc., are not included.

Harvest wages per day with board reached the top figure of $4.48 in the North Central states west of the Mississippi River and the lowest figure of $2.28 in the South Atlantic, and the United States average was $3.15. Without board, the United States average of $3.83 was most exceeded by $5.33 in the former states, while the latter states had the lowest average, $2.82.

Statements in similar form for day dages for work outside of harvest with board make the United States average $2.45, that of the North Central states west of the Mississiuppi River $3.22 and of the South Atlantic states $1.85; the rates without board, in the same order, were $3.12, $4.03 and $2.39.

THE VERSATILE TRACTOR

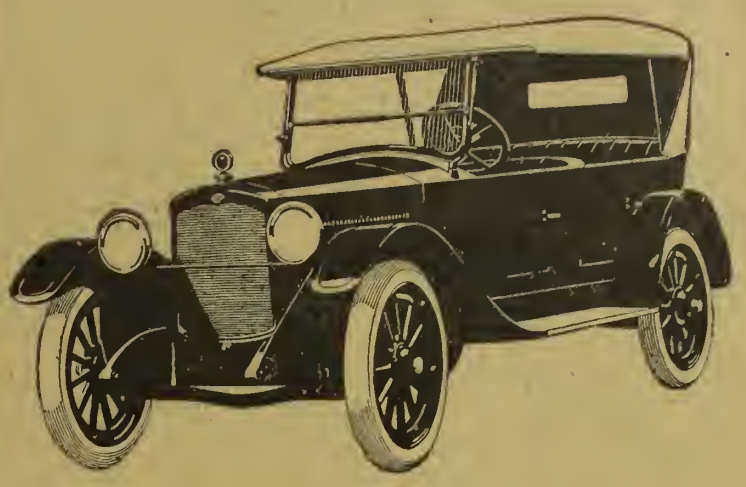
That the tractor on the farm has more uses than merely ordinary work formerly done by horses is shown by the following incident:

The manager of a large ranch near San Bernardino had occasion to prune an orange orchard very severely. They had been large trees and needed the whole top to be renewed. The result was that when the pruning was completed the ground was a network of brush four or five feet deep. Economy of labor was imperative, as it had to be cleared away promptly and labor was at a premium. To burn it on the ground was not safe for fear of scorching the trees. To haul it off to a bare space would cost much labor. So the manager decided to put it under with a disk harrow and tractor. The brush was trimmed up and the limbs hauled off for firewood. The balance had by this time become dry and brittle. The tractor started in with a heavily loaded disk harrow and after attacking it from several directions the entire mulching had disappeared. The writer saw the orchard a month after it had been irrigated and harrowed again, and almost every vestige of the brush had disappeared. Possibly this could have been accomplished with horse work, but certainly not so economically nor expeditiously. The manager of this ranch says they use the tractor for all sorts of special service. Pulling stumps, moving a stalled wagon, and many other devices are resorted to when the habit is once acquired.—E. L. Koethen.

SAN BERNARDINO INSECTARY

The San Bernardino County branch insectary has been completed and is now occupied. Paul Howard, formerly with the department of agriculture, is in charge of the breeding work and the ant control work, which is a necessary accompaniment to the biological control of mealybugs. In this district the citrophilus mealybug is the particular pest to be controlled.

IT SURPASSES COMPETITION



GRANT SIX

This new Grant Six surpasses everything anywhere near its price in beauty, quality and richness of finish; it surpasses them all in power and performance and surpasses them in roominess and comfort just as it surpasses them in practical economy.

If we told you about its fine upholstery, its excellent body finish, its completeness of equipment, including even a Boyce Motometer, you would undoubtedly sense the fact that the car is unusually complete and surprisingly good value in every way.

But you don't buy a car that way. You see it. You ride in it. You size it up in every detail and it is the car itself, not the beauty of its description, that sells you.

Experience gained in building over fifty thousand light sixes is embodied in this car. Careful buying, and quantity production, makes its price possible. And you will be surprised and pleased by its reasonable price just as you will by its high quality.

Four body styles to choose from — Five passenger Touring Car; Three passenger Touring Roadster; Five passenger Sedan; Four passenger Coupe.

Write for new illustrated catalogue and name of Grant Six dealer in your community.

FARM LANDS FOR SALE

FOR SALE:
A HOME AND RANCH COMBINED.
An extremely well laid out plot of land 220 ft. by 464 ft. with full width city streets on three sides and an alley 30 ft. wide on the fourth, only eight blocks from Santa Barbara Post Office and business center. The land is first class sandy loam and will grow anything. There are 146 full bearing fruit trees, including apples, pears, peaches, nectarines, plums, apricots, oranges, lemons, figs, walnuts, loquats, avocados and berries; a good assortment of the best varieties and planted in perfect order. The place is planned for a first class chicken ranch and is fully equipped for 10,000 to 12,000 head of fowls, including houses of the best construction and all modern, with cement floors, automatic drinking fountains, feed hoppers, brooders and houses, manure shed; feed house with alfalfa cutter motor driven, in fact everything in order for a first class farm. There is a well built house containing three bedrooms, living-room, diningroom, kitchen and bath, (oak floors) for a home, and a two story, eight room house for working men. Garage for two cars. The fruit from the place will more than pay expenses. This property must be seen to be appreciated. It is offered at the low figure of $12,000 to settle up an estate. Come and see it, or write for fuller particulars and terms to F. H. Lingham, 10 West Anapamu Street, Santa Barbara, California. (Exclusive Agent.)

Stock and Dairy Ranch—500 acres; will sell all or part; one mile from Valley Springs R. R., Calaveras County. Over two thousand cords of wood on the stump, oak and pine. "PEP"

Vigor, vitality, vim and punch—
That's pep!
The courage to act on a sudden hunch—
That's pep!
The nerve to tackle the hardest thing
With feet that climb, and hands that cling,
And a heart that never forgets to sing—
That's pep!

Sand and grit in a concrete base—
That's pep!
Friendly smile on an honest face—
That's pep!
The spirit that helps when another's down—
That knows how to scatter the blackest frown—
That loves its neighbor, and loves its town—
That's pep!

To say "I will"—for you know you can—
That's pep!
To look for the best in every man—
That's pep!
To meet each thundering knock-out blow,
And come back with a laugh, because you know—
You'll get the best of the whole darned show—
That's pep!—By Grace G. Bostick, American.

LITTLE BEAR'S CHOICE OF A SLEEPING CAVE

By Frances Margaret Fox, in Youth's Companion

LITTLE Bear, if be stopped to think about it, was somewhat down in tbe moutb when tbe maple leaves turned gold and crimson and the Deer children began to talk about making tracks in the snow and playing winter games. He did not like to hear any talk about the sleeping cave.

"If I could have my choice," he said one October morning when Father Bear and Mother Bear were putting away the rain barrel and otherwise getting ready for winter, "we should take my playhouse for the sleeplng cave, because it is near home."

"The entrance is too small," objected Father Bear, and nothing more was said.

The weather that fall was wild and stormy; so Little Bear went every day to his playhouse cave under the west hill. Other children came to play with him, and they had merry times while the wind howled outside and the rain fell.

"The first pleasant day we must look for our sleeping cave," said Father Bear to Mother Bear one night as tbey blew out their candle and went to bed. They thought Little Bear was asleep, but he sat up quickly.

"Please do not take me!" he piped up. "Let me stay here instead and play with the Beaver children."

"Very well," promised Motber Bear. "But cuddle down, now, and go straight to sleep!"

On the first pleasant day Father Bear and Mother Bear fared forth in search of a sleeping cave, and Little Bear went singing down tbe river road to visit the Beaver children.

It was a beautiful, warm morning, but about noon the wlnd changed, and the sun went under a cloud.

"It looks to me as if a snowstorm were coming," said Father Bear.

"We must hurry!" said Mother Bear. They did go as fast as they could, considering that they were both so plump, as bears always are in the fall, and that both wore heavy winter coats.

When Father Bear and Motber Bear reached their favorite sleeping cave they were delighted to find it just as they had left it in the spring.

"Now let's go home and then come back to tbis cave early tomorrow morning with Little Bear," suggested Father Bear.

"We must surely hurry," agreed Mother Bear, "for I do belleve that winter is about to set in."

It was late in the afternoon when Father Bear and Mother Bear reached home; they were dlsappointed because Little Bear did not come to meet them.

"I didn't think he would stay to dinner with the Beaver children," Mother Bear said. "Perbaps you had better go and bring him home."

Father Bear agreed, and off he trudged through the storm to Beaver Lodge. It was growing cold, and he turned his fur collar up round his ears, and hunched his big shoulders.

Sally Beaver was sorry, but she did not know what had become of Little Bear; he had not stayed wlth the Beaver family more than half an hour. Perhaps he was playing with his cousin, Blackberry Bear.

Straight as he could travel, Fatber Bear went to Blackberry Bear's summer camp; but Blackberry was not there. His camp was in order, and it was plain that he bad prudently sought a sleeping cave. Up tbe river and down the river went Father Bear, calling and callIng, but no Little Bear answered. Tben Mother Bear came to join in tbe search. They inquired at all the neighbors' houses, but no one had seen Little Bear. Tbey searched far and near through tbe ancient forest, but did not find him.

It was Mother Bear who thought of the playhouse. By that time snowflakes were In the air, and sbe knew tbat winter had come. Sbe hurried to the cave and through the little door. "Here he is!" she exclaimed joyfully. "Come and see for yourself!"

"I cannot get in!" objected Fatber Bear. "The entrance is too small!"

"If you cannot get in, whatever shall we do!" exclaimed Mother Bear. "Little Bear is sound asleep, and we can never carry him all tbe way to our cave without rlsking our lives in the storm! Do look in, Father Bear!"

Father Bear looked in, and then he understood. Blackberry Bear was sound asleep on a bed of pine boughs, and Little Bear was beside him, dreaming hard, with a smile on his little face. He bad fallen asleep trying to cover Blackberry Bear with a blanket from tbe house.

"Blackberry was probably looking for a cave," said Mother Bear, "and Little Bear brought him here and put him to bed; then he fell asleep himself, poor child! Now, of course, we shall bave to stay here all winter, and we must bring all the blankets from the bouse at once, and settle as soon as possible."

"But I cannot get in!" protested Father Bear. "The doorway is too small!"

"But you must!" Mother Bear insisted. "You will just have to make yourself as flat as you can and squeeze in!"

"All rigbt, just as you say," agreed Fatber Bear; but he groaned.

"You will be tbin enough by spring to go through a crack," Motber Bear added, trying to comfort huge Father Bear. "You won't have any trouble in getting out!"

After Father Bear had brought the blankets the trouble began. He turned sidewise, he made himself as flat as he could, he squeezed and squeezed and squeezed, but he could not get into tbe cave. Worse yet, he could not get out of the cave. Mother Bear tried to pull him in, and tben she tried to push him out, but there he stuck.

It was growing colder every minute and Father Bear began to call for help. Fortunately, Grandfather Grizzly happened to be passing by just tben. He backed up against his friend and gave a hard but kindly bump, and in went Father Bear.

"Good night!" called Grandfather Grizzly.

"Good night, and we tbank you!" answered Mother Bear as she tucked poor, breatbless Father Bear into hls bed.

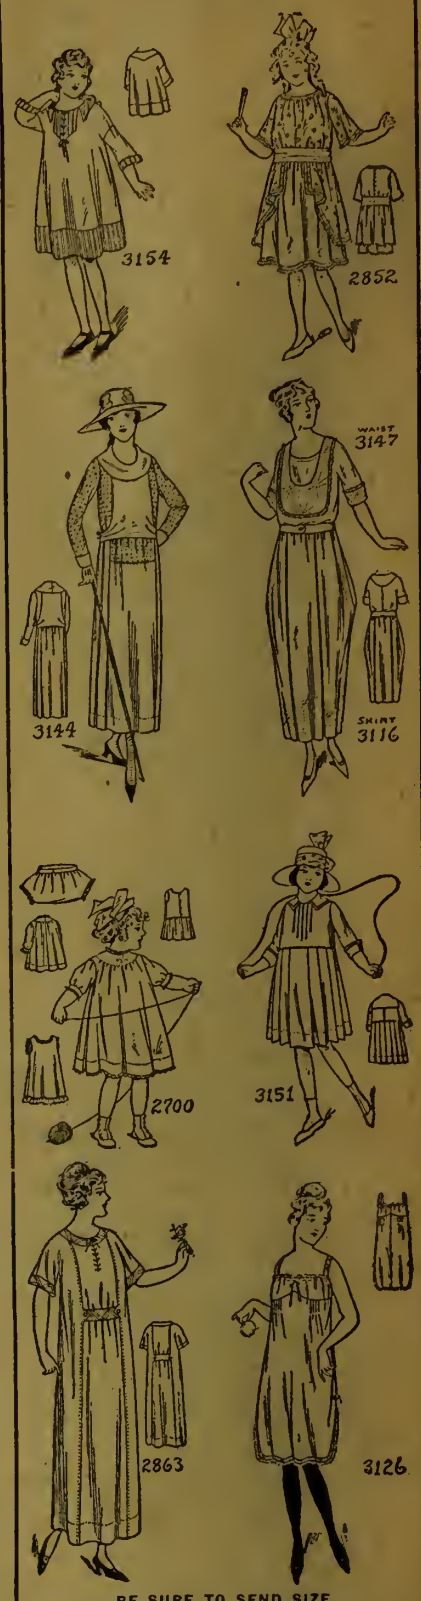
The next day it snowed and snowed and snowed. In the spring when the Three Bears waked from their long nap there was a laughing time In that cave, you may be sure!

THIS WEEK'S PATTERNS

The little girl's frock 3154 shows fascinating possIbllIties of individual adaptation. Made of one color chambray, gingham or Devonshire lt would be charming. Of white, witbout tbe laced-up front, it would be the daintiest kind of a best dress. An outgrown dress can be lengthened and brightened by adding the band around skirt, yoke, collar and cuffs of some contrasting material of a favorite color, or a touch of embroidery on tbe yoke back and front may be added with a swift needle — or there are dozens of variations that will occur to as many different tastes and needs. Such a pattern which may be adapted to many uses is invaluable.

No. 2852 sbows daughter all dressed up for her first party, with slde fullness in the overdress which is just the thing nowadays. That overdress and skirt of contrasting material at

The Cultivator Patterns



BE SURE TO SEND SIZE

3154. Frock for School or Play. Cut in 4 sizes: 4, 6, 8, and 10 years. Size 6 will require 2½ yards of 36 inch material. Price, 10c.

3144. A Stylish Dress. Cut in 3 sizes: 16, 18 and 20 years. For an 18 year size, it will require 5¾ yards of 44 inch material. Width of skirt at lower edge with plaits extended, is about 2¼ yards. Price, 10 cents.

2700. Child's Set of Short Clothes. Cut in 5 sizes: 6 months, 1 year, 2, 3 and 4 years. It will require for the Dress, 2⅝ yards of 36-inch material. For the Drawers, ¾ yard. For the Slip, 1½ yard, for a 2 year size. Price, 10 cents.

2863. Ladies' Apron. Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. A Medium size requires 5⅜ yards of 36 inch material. Width at lower edge, is about 2¼ yards. Price, 10 cents.

2852. Girl's Dress. Cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 will require 3⅝ yards of 36 inch material. Price, 10 cents.

3147-3116. A Stylish Gown. Waist 3147 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3116 cut in 6 sizes: 22, 24, 26, 28, 30, and 32 inches waist measure. To make the dress for a medium size, will require about 6¾ yards of 27 inch material. The width of skirt at lower edge, with plaits extended, is about 2¼ yards. Two separate patterns, 10 cents for each pattern.

3151. A Good Dress for School. Cut in 4 sizes: 4, 6, 8, and 10 years. Three yards of 36 inch material will be required for an 8 year size. Price, 10 cents.

once appeals to the mother of small girls who insist on lengthening out from summer to summer.

A very pretty and stylish sports dress is shown in 3144. Made of one material or of contrasting materials, as shown in the illustration, of jersey, silk or cotton, it would be found serviceable and timely.

The apron dress 2863 we think is particularly clever, confining the fulness at front and back so it will not "slop down" in the way when you are working, while leaving the sides loose and gracefully hanging, it combines good looks and practicability in a high degree. Here again are chances for the individual good taste to make a thing of beauty of a utilitarian garment. Belt, yoke and cuffs of contrasting material or with addition of fancy stitching, buttons or quick embroidery will make it your frock, not a made by the thousand apron. It has all the charm of the prettiest gardening smocks, which are exhibited in the best stores at fancy prices, while getting away from the bunchy effect they too often have. The kimono sleeve style is always welcome to the inexperienced dressmaker, for it does simplify the fitting problem.—R. P. D.

CAN YOUR SURPLUS MEAT

There is a tendency in many farm homes to feast on meat during December, January and February and to some extent fast, as far as fresh meat is concerned, during the other months. This is not at all necessary if some of the meat is canned when animals are killed on the farm. Canning meat is as easy as canning vegetables and the process is the familiar cold pack one which many housekeepers already use. Most farm women will not have to buy equipment for cold pack canning. All that is needed is a wash boiler, a rack which will fit in the bottom of the boiler and will hold the jars an inch from the bottom of the boiler, air tight jars and new elastic rubbers. A canning rack with handles is a great convenience, but a home made one of strips of wood nailed together will serve nicely. If the rack does not have handles a jar lifter will save time and possibly burned fingers. Before beginning to can, see that you have new rubber rings which will stretch without breaking and which can be bent back sharply without showing any signs of holes or of cracking. (Test rubber rings before buying and do not attempt to can unless good rings can be bought.) The jars that are used must be clean and tested to see that they are air tight. The simplest way of testing is to put some water in the jar which has a rubber ring on it, screw or clamp down the lid tightly, invert the jar and shake. If even the least bit of water comes from around the top, air can get in and the jar is not air tight. If the jar which leaks is a bail jar, tighten the bail; if it is a screw top jar try a different lid until one is found that will make the jar air tight. Jars for cold pack canning do not need to be sterilized, but should have warm water added to them so that they will not break when they are filled.

The meat may be packed raw in the jars and have boiling water poured over it, or it may be boiled, fried or roasted, packed in the jar while hot and have the hot fat or meat juice which has been used in cooking, or hot water poured over it. The meat is more easily sterilized if it is not in too thick chunks. Gravy may be made of the fat before it is poured over the meat, but the meat should never be sifted with or rolled in flour before it is cooked, as the flour may form a coating that will prevent thorough sterilization of the meat. One teaspoon of salt should be added to each quart jar of meat unless the meat is cooked with sufficient salt before it is put in the jar.

Place the rubber and lid on the jar. If the jar used has a screw top, screw it down tightly and loosen by turning back not more than half an inch so that enough steam can escape to keep the jar from breaking. If the jar is a glass top one with a bail, do not clamp down the lower bail until the jar is removed from the boiler or the jar will break.

Place the jars in the wash boiler or in the pail of hot water on a rack which holds them up from the bottom about an inch. (To prevent the jars from breaking, have the water in the boiler about the same temperature as the jar and do not plunge the jar in the water, but put it in gradually.) The water should cover the jars about an inch. Put the lid on the wash boiler, or, if a pail has been used, cover it tightly.

After the water has reached the boiling point begin counting the time and sterilize for three and one-half hours to four hours. Sterilize four hours if the meat has been put in the jar raw or has been cooked only long enough to brown, and sterilize three and one-half hours if the meat has been partially cooked.

Remove the jars from the boiler, being careful not to place them in a draft, and at once clamp down the bail on the glass top jars or tighten the lid on the screw top jars as tightly as possible. It is possible to tighten the lid of a screw top jar after it is cool but this should not be done, as it breaks the seal formed by the lid with the hot rubber. Jars should not be opened to refill with hot water or gravy after they are sterilized. The meat will keep even though there is an air space, because the air that may be in the jar has been sterilized just as the meat has been and cannot contain any bacteria which will cause the meat to spoil.

Ham, steak, sausage, pork chops, pork tenderloin, pork roast, beefsteak, meat for beef stew, veal or chicken for salad or creaming, ground meat for sandwiches or hash, rabbit, squirrel, lamb chops, or lamb for stew are all possibilities for meat canning and will prove a boon to the housekeeper on her busiest days, when unexpected company comes or when meat is needed for the day's meals and a trip cannot be made to town.

SPRING AND SUMMER FASHION CATALOGUE

The Cultivator's Spring and Summer Fashion Catalogue is now ready. It shows 550 designs, with helps and directions to the dressmaker, fully illustrated to make easily understood. French seams, feil seams, faced hems, seam binding, couching, fagot stitch cording, cutting bias folds, etc., are clearly explained and illustrated. It will be found a friend in many a time of puzzlement.

THEY CAN ALWAYS FLOAT A LOAN

People who invest in watered stocks ought not to complain if they get soaked—Cartoons Magazine.

Winds and Rains; Aches and Pains

EXPOSURE to bad weather means *rheumatic twinges* and other handicapping after-effects. We can't be too careful in relieving *pains* and *aches*, *stiff joints*, *sore muscles*, *lumbago*, *sciatica*.

"We keep a large bottle of Sloan's Liniment in the house all the time to use when an attack comes on. You know Sloan's is one of the old timers. Doctor Earl S. Sloan put it on sale 38 years ago.

"We get the biggest bottle because it's more economical. A little applied to the spot *penetrates without rubbing* and promptly eases up the pain and ache."

POULTRY

Wholesale prices are:

Leghorn. 38@39; small, 38@39; large, 39@40; roosters, young, 38@40; old, 21@23; broilers, 40@43; fryers, 42@45; turkeys live, 38@40; dressed, 52@53.
Ducks, Indian Runner, 25@27: Pekin, 28@32; geese, 30@32; Squabs, 50@65.
Belgian hares, live, 18@20; Jack rabbits, dozen, 1.50@3.50.

LIVESTOCK

Western Meat Company are:
Cattle—Grass steers, No. 1, weighing 1000 to 1200 lbs., 12½@13; do 1200 to 1400 lbs., 12@12½; do, second quality, 10@11½; thin, 9@9½.
Cows and Heifers—No. 1, 9@10; second quality, 8½@9; common to thin, 5½@6½.
Calves—Light weight, 13½@14; medium, 12@12½; heavy, 9½@11½.
Lambs—Yearlings, 13@13½.
Sheep—Wethers, 11@12; ewes, 9@9½.
Hogs—Weighing 100 to 150 lbs., 14; 150 to 225 lbs., 15; 225 to 300 lbs., 14½; 300 to 400 lbs., 13½.

Moran & Co. quote prices on livestock, weighed and delivered off cars at their plant, South San Francisco, as follows:
Cattle—Good steers, 1000 to 1200 lbs., 12½@13¼; good heifers, 1000 lbs. and over, 9@10; good cows, 1000 lbs. and over, 8½@9; canner cows, 5@6; good bulls, 6@7.
Calves—Light, 13@14.
Hogs—Top packer, hard and well finished; 100 to 150 lbs. 14½; 150 to 225 lbs., 15; 225 to 300 lbs., 14½; over 300 lbs., 13½; under 100 lbs, 13½.
Ewes—9@10.
Wethers—13@13½.
Yearlings—13@13½.
Milk Lambs—14@15.

POTATOES

Wholesale selling price:
Per 100 lbs.: Rivers, fancy, 4.50@4.75; choice, 4.25@4.50; Idaho Gems, 4.50@5.00; Salinas, 5.25@5.50; sweet, 4½@5 per lb.

ONIONS

Wholesale selling price:
Onions, fancy brown, 4.75@5.00; choice, 4.50@4.75; yellow, 5.00@5.25; white, 5.00@5.50. Garlic, China, 14@15; other, 25@30 lb.

VEGETABLES

Wholesale selling price:
Artichokes, No. 1, 1.00@1.10; No. 2, 75@85; No. 3, 50@60.
Asparagus, 30@40.
Brussels Sprouts, lb., 8@9.
Carrots, per sack, 1.00@1.25.
Cauliflower, doz., 1.25@1.45.
Cabbage, doz., 40@50; lb., 2½@3.
Celery, doz. bunches, 45@50; cr., 5.00@7.00.
Eggplant, lb., 15@20.
Lettuce, cr., 50@1.50.
Peppers, Bell. lb., 12½@15; Chili, lb., 10@15.
Peas, lb., 6@8.
Radish, 7@9 doz. bunches.
Tomatoes: Southern, 2.75@3.00.
Spinach, lb., 5@7.

FRESH FRUITS

Wholesale selling prire:
Apples: Bellflower, 1.25@1.50; Newton Pippins, 1.75@2.00.
Bananas, 7@8½.
Cranberries, 4.00@4.25 per standard box; barrel, 8.00@8.50.
Olives, lb., 8@12½.
Pears, box, 2.50@4.00.
Pineapples, doz. 2.50@3.50.

CITRUS

Wholesale selling price:
Per box: Lemons, fancy, 4.25@4.75; choice, 3.50@4.00; standard, 2.50@3.00; lemonettes, fancy, 3.00@3.50; others, 2.00@2.50; grapefruit. fancy, 2.50@3.00; choice, 2.00@2.50; navel, 4.00@5.00; limes, 1.50@1.75 per crate; tangerines, 1.50@3.25 per crate.

HONEY

Jobbing prices: Extracted, Water White and White, 18@20 lb.; Light Amber, 16@18; Amber, 14@16½; Comb, 25@28 for White and Water White and 20@22½ for Wh. Amber.

DRIED FRUITS

Prunes:
Prune prices announcel by the California Prune and Apricot Growers, Inc., were for the base prices, according to sizes, and are: 20-30s, 22c flat; 30-40s, 16c; 40-50s, 14c; 50-60s, 12c; 60-70s, 11½c; 70-80s, 11c; 80-90s, 11c; 90-100s, 11c. One cent a pound premium will be paid on fruit delivered before September 20. On small-sized fruit 8½ cents a pound will be paid for 100-120s and 7½ cents for 120s and smaller.

Peaches:
Peach prices announced by the California Peach Growers, Inc., for 1919 crop dried peaches for the domestic and foreign trade; September, October, November shipment, seller's option; guaranteed against our own decline until January 1, 1920, are as follows:

Standard yellows, 14¾c; Muirs, 15c.
Choice yellows, 15½c; Muirs, 15½c.
Fancy yellows, 16½c; Muirs, 17½c.
Extra fancy yellows, 17¾c; Muirs, 18¾c.
Slabs, yellows, 14½c.

For "practically peeled" add 1½c per pound (any grade).
Prices above are all bulk basis.
For packing in 50 pound or 25 kilo boxes add 1 cent per pound.
25 pound or 12½ kilo boxes, all 1¼c per pound.
10 pound boxes, add 2c per pound.
Blue ribbon peaches packed 2 pound cartons, 12 per case, $10 per case.
Blue ribbon peaches packed 2 pound cartons, 24 per case, $10 per case.
Bakers' special, "practically peeled," 16¾c per pound, bulk basis.

Apples:
Choice (in 50s), 20@20½; extra choice (in 50s), 21@21½; fancy (in 50s), 23@23½.

Figs:
White: Cooking (in 50s), 15@16; choice (in 50s), 17@18; extra choice (in 50s), 19@20; fancy (in 50s), 21@22; extra fancy (in 50s), 23@24; bricks, 12 No. 10s, 1.60@1.67½; bricks, 24 No. 8s, 2.55@2.65; bricks, 50 No. 6s, 4.00@4.15; bricks, 70 No. 4s, 4.20@4.35; layers, No. 10, 2.50@2.80. Calimyrna: Cooking (in 50s), 19; choice (in 50s), 23; extra choice (in 50s), 24; fancy (in 50s), 26; extra fancy (in 50s), 27½; bricks, 10 1-lb., 2.75; layers, No. 10, 2.95@3.20. Black: Standard 14, choice 17@18; extra choice, 18@19; fancy, 19@20.

Pears:
Standard 20, choice 22½; extra choice, 24; fancy, 26@27.

Raisins:
California Associated Raisin Company's prices guaranteed to January 1: Seeded: Sun-Maid, 16s, package, 15; fancy, 16s, package, 15; fancy, 12s, package, 11¾; choice, 16s, package, 14½; choice, 12s, package, 11⅜; bulk, fancy in 25s, 14¼; bulk, bakers, in 25s, 13½; bulk, Malagas and Feherzagos, in 25s, 13. Loose Muscatels: 4-crown, in 25s, 14¼; 3-crown, in 25s, 13¾; 2-crown, in 25s, 13¼; 1-crown recleaned, in 25s, 14. Seedless: Thompsons, 16s, 15½; Thompsons, 12s, 12⅛; Thompsons, bulk, recleaned, in 25s, 14½; Thompsons, bulk, bakers, in 25s, 15½. Bleached Thompsons: Choice, in 25s, sulfur, 18; fancy, in 25s, sulfur, 18½; extra fancy, in 25s, sulfur, 21; soda dipped, in 25s, 17¾; oil dipped, in 25s, 17¾. Suitanas, 16s, 15¼; Sultanas, bulk, in 25s, 14¼. Layers: 6-crown, flat pack, 20s, per box, 4.05; 6-crown, flat, 10s, per box, 2.20; 6-crown, flat pack, 5s, per box, 1.20; 4-crown, flat pack, 20s, per box, 3.20; 4-crown, flat pack, 10s, per box, 1.75; 4-crown, flat pack, 5s, per box, 1.00; 3-crown, tray pack, 20s, per box, 3.10; 3-crown, flat pack, 20s, per box, 2.95; 3-crown, flat pack, 10s, per box, 1.60; 3-crown, flat pack, 5s, per box, 95; clusters, 20-1s, cartons, 3.45; clusters, 12-2s, cartons, 3.80; clusters, 4-5s, cartons, 4.50; vineyard run, 100s, 13.00.

GRAIN

Wheat: The prices are based upon federal grades and standards at the terminals in San Francisco Bay and Los Angeles, and are as follows, per bushel of 60 pounds:

Hard White—	Per Bushel	Per Cental
No. 1	$2.20	$3.66 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.18	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.09	3.48½

The above are minimum prices.
For sacked grain add 4½ cents per bushel of 60 pounds to above prices. Deductions of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.25@3.30; black, 3.00.
Corn: California yellow, 3.15@3.25 per cental; Egyptian white, 3.75@3.80; milo maize, 3.15@3.25.

Barley: Spot feed, per cental, 3.50@3.60; brewing, 3.65@3.75.

HAY

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses are to be added according to conditions:

Fancy Wheat Hay (light 5 wire bales) .....30.00@32.00
No. 1 Wheat or Wheat and Oat Hay .....27.00@31.00
No. 2 Wheat or Wheat and Oat Hay .....26.00@28.00
Choice Tame Oat Hay .....29.00@32.00
Other Tame Oat Hay .....26.00@29.00
Wild Oat Hay .....25.00@28.00
Barley Hay .....25.00@28.00
Alfalfa Hay .....27.00@32.00
Stock Hay .....22.00@25.00
No. 1 Barley Straw, bale..... .50@ .80

Citrus Markets

Los Angeles, February 11, 1920.

Market conditions are very satisfactory though there is fearful range in prices paid in the auctions. This is more because of wide variation in fruit quality.

Keen demand is clearing up the lemon markct and every offering is immediately taken. The most serious situation during the past week has been the abnormal weather conditions which have prevented moving the fruit from the cars.

Shipments

Shipments of oranges to date from Southern California since November 1, 1919: 6,296 cars; lemons, 1,363; total, 7,659. To same date last season: Oranges, 5,444; lemons, 1,858; total, 7,302. From Central California this season: Oranges, 3,428; lemons, 182; total, 3,610. To same date last season: Oranges, 2,210; lemons, 223; total, 2,433. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

AT THE AUCTIONS

February 9

New York: 20 or., 2 lem. Higher. Nav., 1.85@7.80; seedlings, 2.75@2.90. Tang., halves, 3.45; lem., 4.45@6.30.

Think of Pumping Plants NOW

INSURE YOUR WATER SUPPLY

Alpha Engines

For Gasoline or Kerosene
1¾ to 18 Horsepower

MECHANICALLY SUPERIOR—You can see that at a glance. Comparison is the best test.

Back your pump by a correctly designed, dependably built engine. We guarantee superior service.

Make and break spark—nothing better for gasoline. The only one for low grade fuels.

Equipped with a real magneto—Rotary Type.

No Batteries. No cranking.

Viking Pumps

Capacities 10 Gals. to
1050 Gals. Per Minute

FAMOUS for their unequalled effiiciency and durability. Result — More water at less cost per gallon.

Efficiency same under all lifts.

Self Priming. No foot valve or priming pump required.

Pulls to the suction limit. Positive discharge. No churning or loss of power.

Easily and quickly installed.

Place orders early---Deliveries will be slow in mid-season

The Human Side of Service

More than a year has passed since the signing of the Armistice, yet all the world still feels the effects of the War. The Telephone Company is no exception.

More than 20,000 Bell telephone employees went to war; some of them never returned. For eighteen months we were shut off from practically all supplies.

War's demands took our employees and our materials, at the same time requiring increased service.

Some districts suffered. In many places the old, high standard of service has been restored.

In every place efforts at restoration are unremitting. The loyalty of employees who have staid at their tasks and the fine spirit of new employees deserve public appreciation.

They have worked at a disadvantage but they have never faltered, for they know their importance to both the commercial and social life of the country.

These two hundred thousand workers are just as human as the rest of us. They respond to kindly, considerate treatment and are worthy of adequate remuneration. And the reward should always be in keeping with the service desired.

Choosing Proper Implement for Tractor Use

By Clyde L. Clarke

ONE day last week I accompanied the local distributor of a well known tractor to a private demonstration. Fortunately for my friend, there were only three farmers in attendance, and he was able to explain to the "crowd" the reasons why his tractor failed to perform in its best light.

The tractor in question is a good one. The reason why it failed to give a 100 per cent demonstration on this particular day was because of the implement it was drawing. The agent who sold this tractor recommended and urged the purchaser to buy a certain kind of plow to go with it; one which he knew (and I know) works to perfection with the power the tractor delivers, regardless of the soil and grade. However, the farmer had "his eye set" on another plow, and in spite of urging and pleading of the tractor salesman, made the deal.

The farmer's mistake was evident in less than five minutes after the tractor was hitched to the plow. The first hitch was not successful and it took two solid hours for a blacksmith to get the "hitch" in working order.

Finally the tractor was started and headed down the field. The plow did not work right. The balance was wrong. The two machines simply did not like each other and didn't care who knew it! The laugh was on the implement as long as they were going down hill, but when they made the turn and started back up the grade that plow simply laid back and chuckled while the tractor sweat and struggled on. The draft on the tractor was at least 20 per cent more than it should be asked to handle. While it might have pulled even a slightly heavier load it was a wearing, tearing strain that no machine could stand for long.

A few months ago I was vistting a friend of mine in Kansas City—a distributor for a tractor quite popular in that section. While I was in his office a man came in who said that he wanted to look over the "Blank" tractor. As I wanted to write a letter I took advantage of my friends' absence and used his desk. In the course of half an hour the two came back, and the order was signed up for the tractor. It seemed, however, that the matter of the plow to go with it was not yet settled.

Now my friend had the agency for two lines of plows—we'll call them the "Smith" and the "Jones." I happened to know that his profit on the "Jones" was several dollars more than his profit on the "Smith". Yet he was urging the buyer to take the "Smith." Of course he was not acting headstrong about it, but although the farmer wanted the "Jones" he finally decided to take my friend's suggestion.

When the two of us were alone again I asked for an explanation, calling attention to the fact that I knew the two plows were practically identical, and also that he had lost money in changing the buyer's notion.

"I don't know as I can give you a really satisfactory answer to your question," he said. "But I have noticed one thing. Usually the man who buys one of my tractors and takes along a 'Smith' plow is a satisfied and happy owner. I can't say that I have had any complaints of the 'Jones'—maybe it's just a matter of plain luck, but somehow, I feel that I have done better when I have sold the plow that has the least profit of the two."

To my mind the problem is easily solved. While the two plows are almost identical in construction and quality, the one simply fits in with the "Blank" tractor better than the other. A difference of half an inch in some angle about the machine may make a difference of many pounds in the draft.

California in 1868

The 1868 Yearbook of the United States department of agriculture known as the "Agricultural Report," has some interesting facts and figures on California. Among these we find our state has 120,947,840 acres of which at that time 1,198,874 acres had been sold, and 368,321 acres entered under the homestead laws. These lands doubtless were largely in the central and northern sections, for of six United States land offices listed, Visalia is the most southern. Under the title "The Public Domain," it says of California:

"It is estimated that there are not less than 89,000,000 acres of land in California suited to some kind of husbandry. Of this amount over 40,000,000 are tillable, and the remainder adapted to stock raising, fruit growing, etc. The southern portion of the state is more particularly devoted to horticulture. It is said that no better soil and climate are afforded in any country for the cultivation of the grape than this part of California. The yield exceeds that of the most celebrated European vineyards. Three hundred varieties have been introduced. The acreage in vines is about 45,000, with an average of 900 vines to the acre. The vintage of 1867 was estimated at over 4,000,000 gallons of wine and about the same quantity of brandy. One thousand pounds of grapes to the acre is the minimum yield, while as high as 20,000 pounds have been produced. The orange, lemon, fig, lime, olive, apricot, nectarine, pineapple, pomegranate, and other tropical and subtropical fruits grow in great abundance. Fruit trees grow more rapidly and produce larger varieties than in almost any other part of the world. The pear thrives in all parts of the state. In the markets of San Francisco strawberries are sold every month in the year.

"The cereals, potatoes, tobacco, sorghum, and in some localities cotton and the sugar cane, are successfully and very profitably grown. Sixty bushels of wheat to the acre is not an unusual yield. The cultivation of the mulberry tree and the rearing of silkworms promise to become an important source of wealth in the state. The worm seems to be exempt from the diseases which for 20 years have prevailed in many of the cocooneries of Europe, threatening the destruction of the native species. The California silkworm eggs are in great request among European breeders. The state has undertaken to foster this important branch of industry by offering liberal premiums for the planting of mulberry trees and the production of cocoons. Silk factories are being erected in the state.

"Stock and sheep raising is a leading branch of husbandry. The mild winters and perpetual pastures enable stock to graze throughout the year. In the year 1867 there were 2,000,000 sheep in the state, yielding a wool product of 9,000,000.

"California has an abundance and great variety of timber. The redwood, found only here and in the southern part of Oregon, is a valued commercial wood. It grows in dense forests, which are estimated to cover in the aggregate 10,000 square miles. The trees frequently reach a height of 270 feet and a diameter of 18 to 20 feet."

Cooperation has solved the farm labor shortage for a group of seven ranchers in the vicinity of Tulare. When the men, C. O. Martin, Sam Burgan, H. E. Martin, Henry Beckman, M. B. Crossley and M. B. Hargis, found it impossible to secure labor for their ranches they held an informal meeting, selected Mr. Riley, secretary, and Albert Martin, manager, named their organization the Tulare Silo Company and proceeded to build a silo on each place, each man putting up his own. Then the group purchased a 45 horse power gas engine, mounted on a truck, an ensilage cutter and a corn binder. Twelve men are necessary to operate the machinery, the members of the company forming the nucleus of the crew. The company also has between its members some 80 acres of excellent Indian corn, and this crop will be handled by the company, which is just completing the filling of its silos.

Benjamin Franklin said:: Remember that money is of the prolific, generating nature." Buy W. S. S.

A Profit Making Poultry Ranch

By Jean A. Koethen

FIFTEEN years ago Charles G. Weaver bought five acres in the arroyo between Garvanza and South Pasadena and began building poultry houses and filling them with bred-to-lay White Leghorns. Three and a half acres of this five acre ranch is covered with laying and breeding houses, colony houses for the youngsters, brooder houses, incubator house and feed house. The commodious new residence, and a field of a little more than an acre, in which greens are raised, fill the remainder. It takes an acre of greens to supply a thousand hens, Mr. Weaver says. His houses ha e encroached so upon the original acreage allowed for this purpose that he is obliged to raise a large part of his green stuff on rented land.

Barley and Sudan grass are the main dependence for greens, barley being grown from the middle of October till the first of June and Sudan grass the other four or five months. Each planting of barley makes three or four cuttings. Run through a clover cutter and fed daily in the late afternoon it keeps the hens supplied with an abundance of succulent green. The Sudan grass is fed in the same way and grows with even greater rapidity.

Hatch in March

All the hatching on this ranch is done in March and the four weeks between the middle of September and the middle of October. Contrary to the experience of many poultrymen, Mr. Weaver finds the molting of January and February pullets in the fall a decided objection to very early hatching. March pullets are in good laying form before fall and do not molt if properly fed, while those hatched in October are excellent spring and summer layers. The incubators are started in February, and during the month of March from 4,000 to 5,000 chicks will be hatched to keep up the flock of 3,500 layers. Other years the Weaver ranch has sold baby chicks. This year all the eggs are contracted for hatching at a price which makes them more profitable than chicks.

Public Should Be Educated

"There has been an almost unprecedented demand for chicks," said Mr. Weaver, "but it is slowing up now on account of the rise in feed prices. I don't see, myself, how all these new folks that are going into the business are going to break even. I have a letter on my desk now from a chap back East who wants to come out here and put four or five thousand dollars into the poultry business, and I don't know how to answer him. If I say, 'Don't come,' he will think I am afraid of his competition. If I say 'Come,' he will blame me if he fails. Overproduction is bound to bring down prices, and goodness knows they are little enough now. If the public could only be made to understand how small a profit the poultryman makes under the most favorable conditions it wouldn't be so quick to boycott eggs. Why, I haven't a doubt his eggs are costing the small producer 75 cents a dozen right now, and he is selling them for 60 or thereabouts. Later in the spring when production becomes heavier the balance will be on the right side of the ledger again, but prices and production during the summer have got to be big enough to average the loss during the winter. The farm papers understand this, of course. If the big newspapers would now and then publish an article telling folks what the poultryman is up against with these awful feed prices, instead of always helping along the boycotts, shouting "Profiteer," if the poultryman does happen once in a while to break even, it might do some good. The public is always reasonable when it understands."

Feeding for Fertility

As all the eggs are sold for hatching, the 2,600 breeding hens are fed to secure high fertility. A breeding mash is kept before them, and the scratch mixture consists of 40 per cent wheat and 20 per cent each of barley, cracked corn and milo. Sprouted oats are fed freely.

No feed is given in the morning. The hens have their dry mash in the hoppers and some scratch grain left over in the litter from the night before. At 10 a. m. three days in the week a five per cent solution of a buttermilk preparation is set before them, a gallon and a half being allowed each hundred hens. The other days, at 11 o'clock, buckets of moist mash are carried around by one of the men. At 4 o'clock the scratch grain is fed, the allowance being so liberal that some is left for morning. About 4:30 cut green feed is fed in the troughs. The purpose of feeding so late is to keep the greens from wilting as long as possible. The hens eat what they want at night and find some still fresh in the morning.

Instead of sprouting grain in boxes, Mr. Weaver drills it into the yards. The hens eat some as soon as it is planted, and the rest in various stages of sprouting, but it keeps them digging. They get a lot of exercise, and they also get the grain.

The long house used on this ranch is similar to that in general use among commercial poultrymen. It is 16 feet wide and 200 feet long, and is intended to house from 1,000 to 1,200 hens in three flocks. The runs are 100 by 200.

POULTRYMAN'S CALENDAR—FEBRUARY

Hatching continues this month, and brooding begins. Some chicks are out in January, but from the first to the middle of February is generally considered the choicest time for a chick to come into the world.

Brooding cannot be too carefully planned for, whether it is done naturally or artificially. If hens are used, they must be in coops tight on three sides, and kept in a sunny, protected spot. If brooding is artificial, see that the chicks have a warm place to go to when they feel the need of heat, a cooler place to play in, and a chance to run out of doors on the ground. They will soon learn where to go for comfort.

Don't neglect to guard against mites by frequent spraying or painting with insecticides, and dust occasionally for lice. Chicks that are warm and well nourished and clean ought to grow very rapidly this month.

Poultry Queries

Conducted by J. A. Koethen

Possibly Poisoned

Can you tell me what to do for my chickens, mostly pullets and young roosters, White Leghorn and Barred Rocks? They seem all right in the morning, but in the evening their combs look dark and the next day they are dead. I feed them Gyp corn and wheat and they have all the range they want.—Subscriber, Willows.

How many of the flock are affected? I am not told, and that is the very heart of the whole matter. If the trouble is general, your hens and roosters must be finding something on range that they ought not to eat, a dead gopher or chicken, some poisonous preparation that has been used for spraying trees or vines, or perhaps paint skins or salt. If only an occasional bird is affected the trouble may be due to liver trouble which has been coming on gradually without your noticing it. Your ration of Gyp corn and wheat is not sufficient but it ought not to make the birds ill unless they are allowed to stuff themselves with the Gyp corn till their intestines are overlaid with fat. Better shut them up till

GET MORE EGGS

"Lady Victory"

1918 Champion laid 304 eggs in 365 days. Highest official record of any living hen. She laid 25 eggs in Jan., 27 in Feb., 29 in March.

Milkoline will help make your hens lay more eggs.

Feeding Milkoline will make you more money—reduce mortality of your flock—keep flock healthy and less liable to disease.

Increase Poultry Profits Any poultry raiser can easily double his profits by doubling his egg production. Feeding Milkoline with other feed greatly assists assimilation, keeps digestive organs vigorous and is a wonderful appetizer, tonic and bowel regulator. Milkoline contains nutritive elements vital to egg production and not found in grain rations.

13,000 More Eggs

Jas. E. Keyes, Petaluma, Calif., says: "After feeding Milkoline for eighteen months to 2,500 hens, I find that worms cannot exist in poultry where Milkoline is used. I reduced mortality with laying hens 10 per cent. I increased the egg production of my flock thirteen thousand eggs in one year. Feeding Milkoline to laying hens keeps them in splendid health thereby preventing disease and derangements of all kinds."

Milkoline has a base of modified buttermilk with essential fats and acids added. Milkoline comes in condensed form. Will not mould, rot or sour. Keeps indefinitely in any climate. Milkoline is simply "Good Buttermilk Made Better for Feeding." Flies don't bother it.

Lowers Feeding Cost

Many feeders say Milkoline lowers feeding cost one-third, because their hens assimilate all feed they eat. Our liberal Guaranteed 30 Day Trial Offer enables you to try Milkoline at our risk—to prove that it will make you mighty good money.

Prevents Disease

Milkoline is not featured as a cure for anything or a preventative, but due to the acidity in the buttermilk it is a germ destroyer and helps keep poultry healthy, which is the best preventative against disease. Milkoline is invaluable as a life saver for baby chicks.

PRICES

These prices are F.O.B. Kansas City or the address of our nearest dealer. Dealers in all parts of the United States.

5 Gal. Keg - $7.50
10 Gal. Keg - 12.50
15 Gal. Keg - 16.50
32 Gal. Barrel 32.00
55 Gal. Barrel 49.50

Prices on smaller packages given in booklet. Buy in barrel lots—it saves you money.

Only 2c a Gallon

For feeding mix one part of Milkoline to 50 parts of water (small feeding 5 tablespoons to gallon of water). Feed either with water or mash feed. Milkoline keeps their appetite keen and its action is highly essential to normal egg production. When fed as directed Milkoline costs only 2c a gallon or less. Trauhaft & Newman, Lankershim, Calif., say: "We would not go back feeding straight buttermilk at any price."

Guaranteed Trial Offer

we will ship you 1 Gallon for $2.25, express prepaid. Take 30 days—feed half to your poultry. If not entirely satisfied simply return unused portion and we will refund every cent you paid us. No charge for portion you have used. Milkoline is legally guaranteed to be satisfactory. You are always the judge. We suggest ordering larger quantity—you get the benefit of lower price—you risk nothing—you must be satisfied or we refund every cent you paid us. Make this test now. The sooner you begin using Milkoline the quicker you will be making money.

SMOKE YOUR MEAT THE "WRIGHT" WAY

Thousands of Farmers are Using Wright's Condensed Smoke (made from seasoned *Hickory Wood*). A small brush, thirty minutes and a $1.00 bottle Wright's Smoke, smokes a barrel of meat. *Smokes it thoroughly and gives the meat a delicious flavor.* No fooling with fires. No danger of meat spoiling. No drying out or shrinkage. Easier, Cheaper, Quicker and better than using a smoke house.

Curing Meat Before Smoking is very important. Wright's HAM PICKLE is a scientifically prepared sugar cure that gives perfect results. A $1 jar and 27 pounds of salt cures a barrel of finely flavored hams and bacon.

Wright's FARM BUTCHERING SET (Nine regular butchers' tools, including saw and cleaver) should be on every farm. We buy in carload lots and Re-sell at Cost—$3.95. Send for instructive booklet: *"The New Way of Smoking Meat."*

All Wright Products are Guaranteed. Sold by All Drug and General Stores.

you have searched their range. Meantime give the whole flock a good dose of Epsom salts. Dissolve a scant teaspoon for each bird with water, and moisten sufficient mash to give a scanty meal. If you have no laying mash, bran will do. Feed greens freely, keep a dish of bran before them and give no grain but a little wheat at night till they are better. If you have sour milk moisten their bran with it once a day. When the trouble is past get one of the good laying mashes on the market and keep it in hoppers where the hens can have free acress to it. Feed hard grain only at night, and not more than a quart to 15 hens.

Bantams

In your issue of January 24 the question of Bantams for Eggs is answered by J. A. K. in a way that makes the Bantam a toy. What other Bantams are I do not know, but I do know that a few years ago, I think it is three years, a breed of Bantams, the Golden Spangled Hamburg, was imported from England. These birds are splendid layers, eggs weighing 19 to 22 ounces per dozen. Birds mature in six months. Cost of feed about one-half that of any Mediterranean breed. I do not own any, but had occasion to observe them and have secured a setting of eggs to raise layers for home use.—Careful Reader.

After receiving the query referred to, realizing that my own acquaintance with Bantams was not extensive, and wishing also to secure some eggs for my small daughter, I took a day off and went to visit a Bantam fancier in a neighboring city. He didn't exactly set the dog on me, but he told me I had come to the wrong place and almost "shooed" me off the premises. After such a jolt I did not feel like pursuing my search for Bantam lore any farther. Thank you very much, "Careful Reader." I am glad to know something definite about these beautiful pets as producers and shall have some of those Golden Spangled Bantams before I am a year older.

Pullets for Fall Delivery

I notice your reply to inquiry of Subscriber, Falibrook, in the issue of January 10, concerning the raising of pullets for fall delivery. Boys in the poultry course in this school are now beginning their incubator and brooder work, and I am quite interested in the matter of providing an outlet for their production. I feel that we are in a shape to handle such a contract as you mention. We have two incubators and plenty of facilities for the growing of the chicks. I would be pleased to near from you along this line and to receive any suggestions you might make. While our plan must consider education first, yet I feel an incentive of profit is necessary for our best work.—G. B. H., Pasadena.

The only way I know of to secure such a contract is to let it be known that you are after it. The inquiry we published January 10 brought a reply immediately from a man who wanted 400 pullets raised. Very likely your letter will meet the eye of some one who is interested both in pullets and in education. I would sooner trust the raising of pullets to high school boys who have a genuine interest in their work than to many an "old stager" who thinks he knows all there is to be known. If the publicity I am giving your query does not bring the desired result, try an ad in the Cultivator. Whether or not you are able, at this late day, to secure the contract you would like, I think you would be quite safe in raising the pullets without it. There is always a good demand in the fall from people who are just beginning poultry work or who have not been able to raise their full quota of pullets.

Healthy and Vigorous Fowls Mean Strong Livable Chicks

Mating Time

One of the most important seasons of the poultry year is at hand. At mating time your hens and roosters should be in the pink of condition. Start in now to condition your breeding stock for the spring hatch.

Dr. Hess Poultry Pan-a-ce-a

increases the vitality of the parent stock, gives you fertile eggs, insures a hatch of good, strong, vigorous chicks.

Speed up egg production during winter with Dr. Hess Poultry Pan-a-ce-a. It contains tonics that promote a hen's digestion, tonics that tone up the dormant egg organs—so that the proper amount of food goes to egg production—and not all to flesh and fat and laziness—when it's action and eggs you want.

Pan-a-ce-a supplies the additional iron for the blood—which is essential to the speeding-up process. It contains certain forms of lime, that supply needed material for making egg shells. Also internal antiseptics.

Feed Pan-a-ce-a to all your poultry to make and keep them healthy. The dealer refunds your money if it does not do as claimed. Tell the dealer how many fowls you have and he will tell you what sized package to buy. Always buy Pan-a-ce-a according to the size of your flock. 30c, 60c and $1.25 packages. 25-lb. pail, $3.50; 100-lb. drum, $12.00. Except in Canada.

FEED GREENS

California is dry and the laying hens are being denied the greens they usually get at this time of the year. If cut green alfalfa is not available try sprouting grains. Sprouted barley and oats make a very good green feed and are used quite extensively. The grain can be soaked for 12 hours in warm water and then spread out in a layer of from one-half to one and one-half inches deep on a floor or in a tray or tier of flats which have openings or holes or a three-sixteenths inch mesh wire bottom, so that the water drains freely. They may be stirred daily, sprinkled, or allowed to sprout without stirring, until ready for feeding. They are usually fed when the sprouts are from one to one and one-half inches long, although some poultrymen prefer to allow the sprouts to grow to two or three inches long. Sprouting of grains calls for a moist and warm atmosphere in which to sprout quickly, so that it is necessary to furnish heat or to keep them in a warm room during the winter, while they may be sprouted out of doors during the rest of the year. It takes from six to ten days to sprout oats, depending on the temperature of the room.

MITES REMAIN IN FEATHERS

Chicken mites, the night pest of poultry, may not always leave the fowls before daylight, as commonly supposed, but may remain in the feathers in such numbers as to make poultry possible carriers of this pest to uninfested places. This fact was brought out recently by an entomologist of the United States department of agriculture in the course of a study of the life history and habits of the chicken mite, undertaken to discover principles on which combative measures might be based.

AS A LAST RESORT

The Professor—"After years of effort I must confess defeat. I cannot write. There is no originality in me; neither can I present the thoughts of others pleasingly. But," and his face brightened at the thought, "I will teach others to write." So he became a professor of English.—Life.

HIS FINANCIAL DEGREE

Neighbor: So your son got his B. A. and his M. A.

Father: Yes, but his P—A still supports him.—Boston Transcript.

POOR PAPA!

"Father, you took a science degree at college, didn't you? "Yes, my boy; I spent two years on science." "When you look in a mirror the left side of your face appears to be the right side and the right side seems to be the left. The looking-glass reverses it, doesn't it?" "Yes, my lad." "Then, why, papa, doesnt it reverse the top and bottom of your face in the same way?"

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Workmen's Compensation

Is one violating the law and subject to penalty if he does not maintain compensation insurance on a ranch where a man is hired occasionally? I was told that I would and was quoted section 29-B, chapter 586 of the laws of 1917. Is the state of California state compensation insurance fund a state institution or private company?—Subscriber, Paso Robles.

The section of the workman's compensation act quoted was amended in 1919. The section provides that the employer shall secure the payment of compensation by insuring in a duly authorized insurance carrier or by securing from the commission a certificate of consent to self insurance. Subdivision B provides that in case of failure to secure the payment of such compensation, in either of those methods, in case of injury to an employe he or his dependents may file application for compensation with the commission and in addition thereto bring action against the employer for damages, in which he shall be entitled to levy attachment on the property of the employer in an amount to be fixed by the court, to secure the payment of any judgment which may ultimately be obtained, which said judgment shall also include an attorney's fee to be fixed by the court. After a judgment is obtained in such action and compensation which has been included by the commission paid, such payment shall be credited upon the judgment. The burden of proof in any such action shall rest upon the employer to rebut a presumption of negligence upon his part, and the defense of contributory negligence or assumed risk shall not be available to the employer. However it is only employes within the meaning of the act to whom these provisions apply. Under section 8-A of the act, persons whose employment is both casual and not in the course of trade, business, profession or occupation of the employer, and any employe engaged in the household, domestic service, farm, dairy, agriculture, viticulture, or horticulture labor, in stock or poultry raising are excluded from the operation of the act. Section C of the act provides that the term casual refers to employments where the work contemplated is to be completed in not exceeding ten working days without regard to the number of men employed and where the total labor cost is less than $100. The phrase "course of trade, business, or occupation" includes services tending towards the preservation, maintenance or operation of the business or business premises or property. The state compensation insurance fund is a state [illegible]n.

[illegible]AINAGE LEGISLATION

By Prof. C. F. Shaw, University of California

More than 1,000,000 acres of formerly productive lands in California have already become practically worthless because of rising water table and the resulting alkali accumulations, and additional millions of acres of highly productive irrigated lands will become barren and worthless unless drainage district legislation providing for an equitable assessment and spreading costs, is immediately adopted. The most serious problem before the farmers of the arid regions today is the protection of their irrigated lands from poor drainage and its attendant evil, the accumulation of alkali. In its original condition the irrigated lands had a very deep water table, often 60 to 100 feet below the surface; through the seepage from irrigation canals and through overirrigation this underground reservoir has been filled up and the water table brought close to the surface.

This high water table has not only caused injury to trees and other deep rooted crops by drowning out the lower roots, but it has also introduced the problem of alkali accumulation. In regions where poor drainage is causing damage or where the water is rising and threatening early injury, means must be taken to check the rise to prevent further loss. This can be most readily done by the installation of adequate drainage systems, preferably by tile drainage. Drains must be laid deeply, as the water table should be kept six feet or more below the surface.

One of the most serious needs in solving the drainage problem in California is the passage of suitable drainage legislation. California has satisfactory laws covering the reclamation of swamp and overflow land, but wholly inadequate laws covering the drainage of farmed lands. Under the present laws it is exceedingly difficult to organize drainage districts covering lands just beginning to suffer from high water—where the drainage is not uniform or general, but occurs in the lower lands. The owners of the undamaged or slightly damaged lands are unwilling to enter a drainage district unless they can be assured that they will be asked to bear only their fair share of the expense of drainage and that the district will have a capable and effective administration. This our present laws do not assure.

A drainage district law is needed that will provide for an assessment of benefits accruing through drainage, and a spreading of the costs on the lands in proportion to these benefits. The law should provide adequate means for financing the district, for a sound administration of the business of the district, and for maintenance of the canals and other works necessary for good operation.

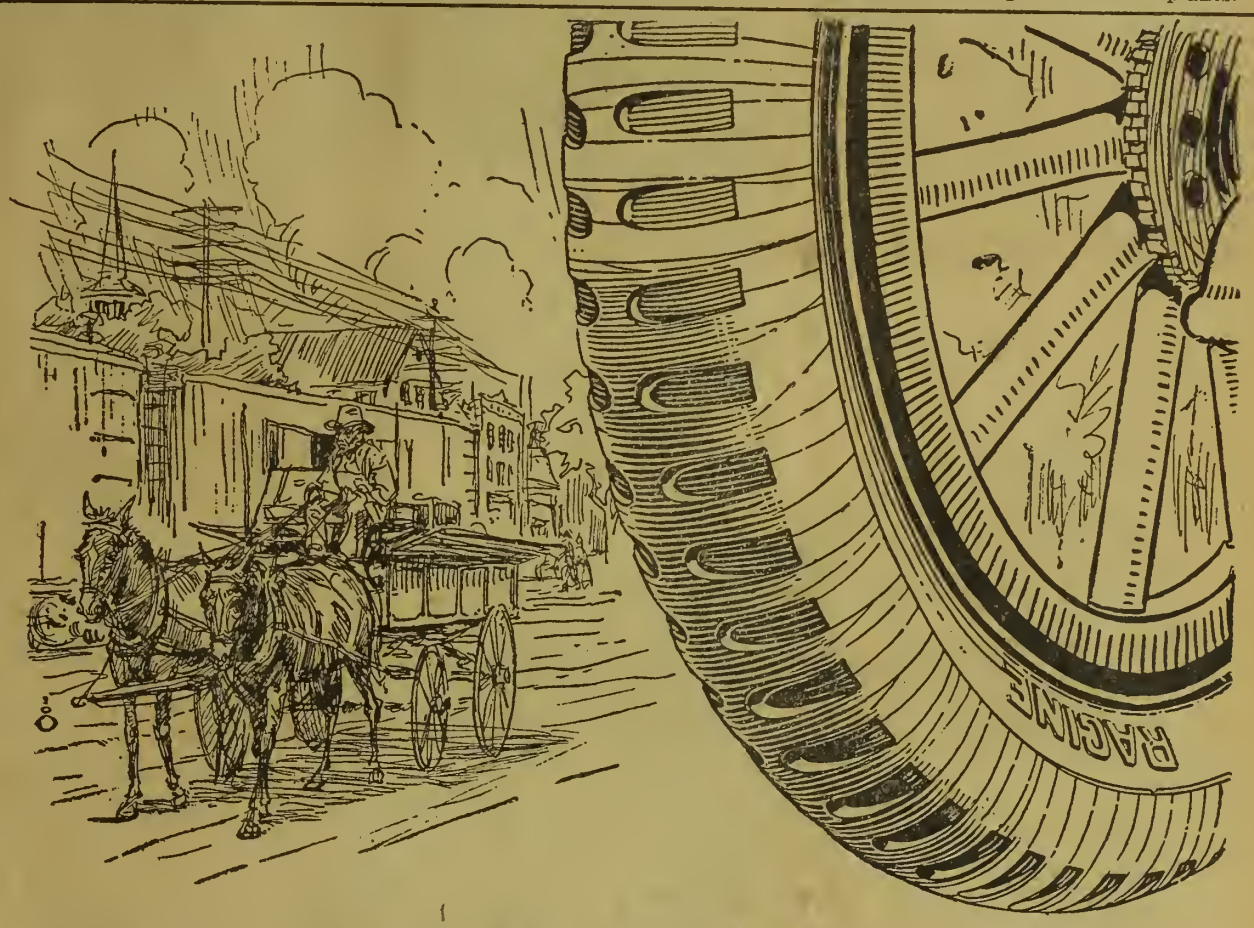
If we devote our time disparaging the products of our business rivals, we hurt business generally, reduce confidence and increase discontent. The best way to get new business is not to undermine a competitor, but to create new markets and encourage increased demand.

THE WAYSIDE MARKET

The wayside market has become popular with small growers whose fields front much traveled highways. The crops cost much to transport to city markets and the prices are not always satisfying. So many wayside growers have become wayside dealers, selling the produce at retail and thereby eliminating the middleman. Some fortunately situated also handle the crops of neighbors whose fields do not touch busy highways and have thus become more than growers. Marketing the small crop at home is each year becoming more popular.

SOUTHERN CALIFORNIA FISH

The principal source of the fish food supply for Southern California is the west coast of Lower California, some of the supply going as far north as San Francisco. A Japanese company of San Diego owns a fleet of 12 small fishing vessels, three regular tenders and two combination fishing and tender boats. This company maintains five camps and has 80 Japanese fishermen regularly employed. The principal food fish caught are halibut, corbina, bass and rock cod. Tuna, sardines, mackerel, abalones and turtles are supplied to California canneries, and non-edible and spoiled fish go to the fertilizing and fish oil plants.



FOR COUNTRY RIDES

Racine Country Road Fabric Tires are built especially for service on country roads. This tire, like the famous Racine Multi-Mile Cord, possesses just that necessary *extra* stamina to yield greater mileage under all road conditions.

EXTRA TESTED *for* EXTRA MILES

Racine Tires are all carefully Extra Tested, step by step, through each manufacturing stage, so that only perfectly built Racine Tires can reach the car owner. The proof of this high quality is the continually matchless performance of Racine Tires everywhere.

Plus this enduring quality, Racine Tires have the industry's supreme mile-making achievement, Racine Absorbing Shock Strip, welding tread and carcass perfectly. Racine Extra Tested Tires always yield their money's worth in miles. Be sure every tire you buy bears the name

Racine Rubber Company, Racine, Wis.

RACINE TIRES
COUNTRY ROAD FABRIC

—it's an open secret

Success in the dairying business hinges largely on two things: the character of the herd and the character of the feed—for the feed tells in the flow. This little handbook—which is yours for the asking—takes the feeding question and simmers it down to actual profit-figures that you can use every day. You'll find it a big little help.

It has been the experience of successful dairymen that the highest priced concentrates are usually the cheapest in the long run and the full flow. They have found that a cow will produce the greatest amount of milk at the lowest cost when fed on an ideal *roughage* like alfalfa hay and an ideal grain *concentrate* like SUREMILK.

How to measure the true food value of different stock feeds—how to cut down the cost of milk production—how to know which cows are really profit-producers and which are not—all this is explained in the new edition of our booklet, "Converting Feed Into Money."

You'll find the booklet decidedly practical and worth while. Full of "real meat" and profit-hints to every dairyman. Send for it now—it's free! Simply cut out the coupon and mail today!

Pruning Grape Vines in California

By F. Flossfeder

MERY many pruning systems are applied to the grape vine. The systems differ in the body of the vine and the management of the annual growth. Some of the differences depend on variations of the nature of the vine, on the cultural and growing conditions of the district, and on the objects of the grower.

Ideals of Pruning

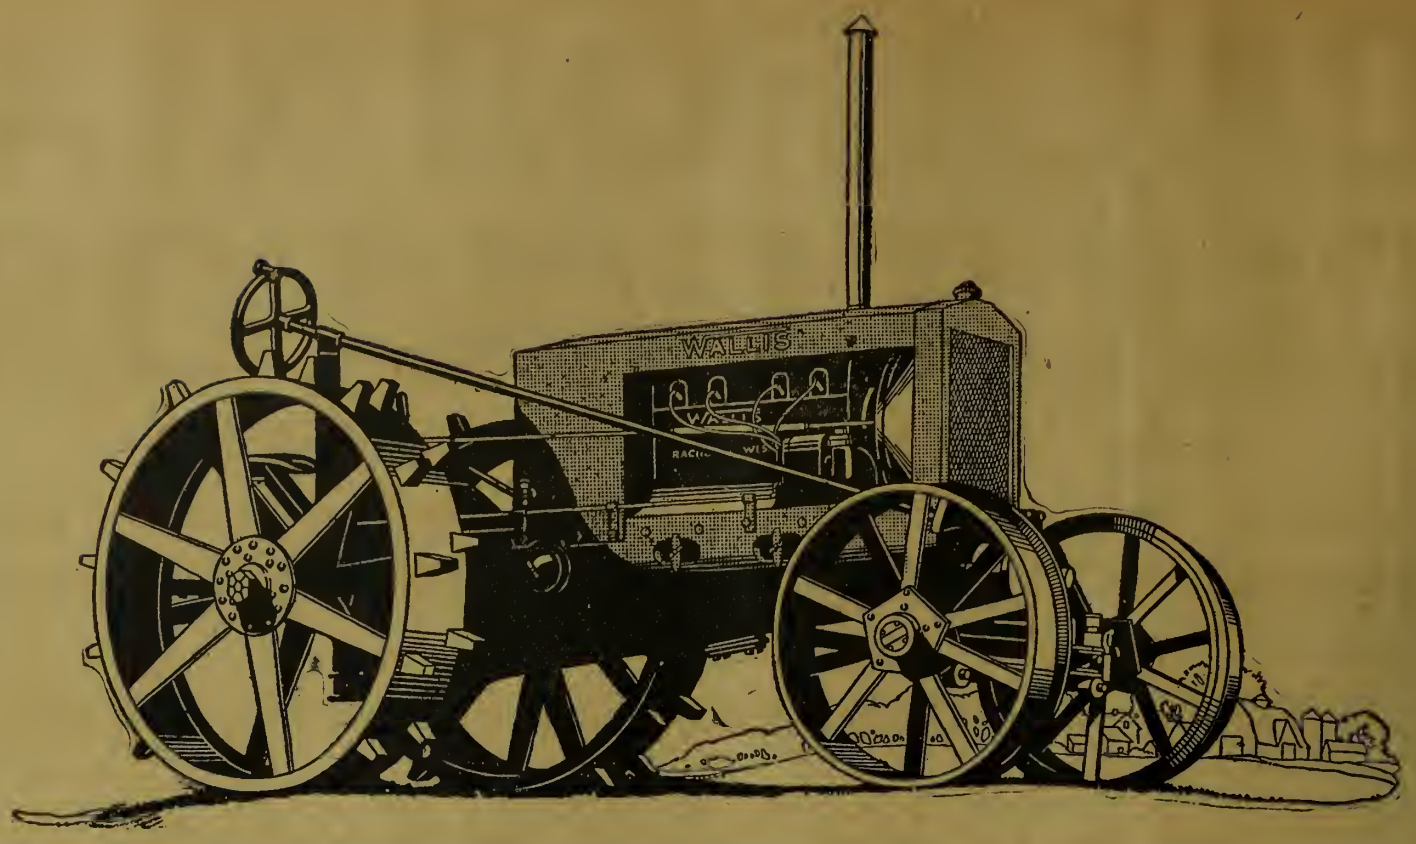
Before the pruner starts to prune his vines he should have formed a mental picture of an ideal grape vine and the form most desirable for his vineyard. Grape vines are subject to so many accidents of weather, cultivation, disease and insect pests that even with the greatest care and skill it may be impossible to obtain a single ideal vine in the vineyard. The ideal grape, however, always should exist in the pruner's mind.

Rooted grape vines which were planted in the spring of 1919 will have made several shoots of various lengths during the last growing period. The number will depend on the number of buds left when the "rooting" was prepared for planting. Very often people are under the mistaken idea that the more stems they leave the more grapes they will get. Such, however, is not the case. If the young vine before planting was pruned in a manner leaving nothing but one shoot, and if this shoot was then cut to two buds, we will find that it has made a few shoots varying from one to six feet in length, depending upon the care the plants received during their first year in the vineyard.

Sometimes vineyards are started by planting unrooted cuttings. Owing to the large demand for certain varieties it seems that the nurserymen of this state have not been able to fill all their orders, and the writer was informed sometime ago that a good many growers intended to plant unrooted cuttings. The soil in many of our best vineyards is useless for rooting grape cuttings. If it is very sandy and plenty of water for irrigation is available, this scheme will work, but it may be advisable to plant two cuttings instead of one; these should be planted in such a manner that, in case both of them grow, one can be removed without injuring the other. It also may happen that none of them will grow, and in this case one of the rooted cuttings can be taken and transplanted from where two are growing. "Never allow two vines to grow where there should be only one." If the grape vines have made a good growth during the first year, and if stakes were driven before planting, a young shoot, after the rest of the growth has been carefully removed, when about six inches long, should be tied to the stake; this, however, is very seldom done. As a rule, the one year old canes are lying on the ground, pointing in every direction. It makes no difference what kind of grapes we are growing, be they raisin, table or grape juice, "Every grape vine should have a distinct stem or trunk;" for Muscats, at least 15 inches high, for stronger growing table grapes, such as the Emperor, Cornichon or Tokay, at least 18 inches high, and the same height would apply to the Sultanina (so-called Thompson Seedless).

Staking

The young grape vines should, if possible, be staked before pruning and the stake driven in such a manner that the vine will be between the prevailing direction of the strong winds and the stake; this will prevent a great deal of trouble. If the stake is driven in the opposite direction, strong winds will break the tying material which will require the going over of the vineyards more than once to retie the loose vines. After the stakes have been driven, which should be done in such a manner that all the stakes have the same height, the measurement of which can be marked on the handle of the sledge hammer, the pruning can be done, and it will pay to have a man for this job who has had more experience and possesses more skill than the average so-called expert pruner. He will select a nice strong cane and—(Continued on Page 284)



TODAY the trend of thought is more strongly than ever toward the Wallis—the champion of quality and engineering excellence. This is true because of Wallis performance, and because the average Wallis owner cannot restrain his enthusiasm over what his Wallis does for him.

HE finds in this quality tractor the machine that meets his every demand. Power is there in abundance; and dependability which insures unfaltering service is a characteristic that wins his admiration. And finally the realization that his Wallis is built to stand the strains—that it keeps on going from one plowing season to another, with a singular freedom from trouble—wins his heart. And naturally, in his enthusiasm he tells his experiences to those he meets.

So it is the news of Wallis performance is carried. So it is that men everywhere know of this *quality* tractor, which has supplanted bulk and heavy weight with compact design and fine engineering.

Ask any dealer or Wallis owner to tell you about its superior features. He will point out Wallis valve-in-head motor with its removable cylinder sleeves and completely machined combustion chambers; the famous "U" frame—the strongest yet lightest foundation ever built into a tractor; the cut and hardened steel gears, fully enclosed and operating in a constant bath of clean oil; the oversize friction-reducing bearings and many other Wallis improvements.

And today—as evidenced by the steadily increasing demand for Wallis Tractors—the American farmer is voting for the assurance, dependability, durability and economy that this Wallis advanced engineering brings.

If you want a Wallis do not delay. See your local dealer or write us at once.

Important Dried Fruit Insects in California

By E. O. Essig at Convention of Fruit Evaporators at San Jose

THE packer, distributor and consumer of dried fruits has to reckon with insects in much the same manner as the orchardist, and while these parties appear to be far removed from the producer the latter must in the long run stand the losses occasioned by insect pests often due to the negligence of the former. It is not at all difficult to understand that consumers desire and demand a clean wholesome product and that state and federal regulations are aimed to secure it for him. Therefore the fruits that most nearly meet or, better, that more than meet his requirements in this respect, are the ones which will command the best prices and greatest sales. It is the producer who must be convinced that it is to his interest to see to it that his fruit is put on the market free from insect or other contamination and to keep it that way until it gets to the consumer if that be possible.

The accomplishment of this entails not so much financial consideration as care in processing and packing. There are not many insects to consider in this state, but the few are often responsible for a great deal of damage and loss. Those which might be briefly considered may be roughly placed in two groups, moths and beetles. The young or larvae of these two groups resemble each other considerably and their method of work is much the same, but the adults are widely different.

Moths Attacking Dried Fruit

The larvae or caterpillars of the moths are usually whitish or yellowish with sometimes a pinkish or even greenish cast. They have three pairs of true legs near the head and also five pairs of fleshy prolegs along the middle and posterior portions. They are able to move quite rapidly and often wriggle violently when disturbed. They are great web-spinners and their presence is usually first manifest by the webbing of the fruit and the package or container. When full grown the caterpillars spin a felty white cocoon in which the chrysalis stage is passed and from which the adult or moth subsequently emerges. With a wonderful scent and good powers of flight the moths are able to search out any food which may be in storage in a packing house, warehouse or storeroom and immediately deposit eggs directly upon the dried fruit if possible or upon the container. The eggs hatch quickly and some of the very minute caterpillars get to the fruit if there is a crack, however small, available. If the package is not sealed it is sure to become infested if exposed. Each generation from egg to adult requires but a month or two under favorable conditions so that the pests are able to reproduce very quickly and in great numbers.

The Indian Meal Moth

The most generally distributed and most serious pest to dried fruit in this state is the Indian meal moth, Plodia interpunctella Hubn., which breeds in all cereal products, nuts, seeds, dried fruits and many other foods. The caterpillars are yellowish white and average about one inch in length. They are profuse web spinners and their webs, covering the fruit and containers, are more injurious to the appearance of the dried fruit than the work they do otherwise. Their presence is easily detected by the webs. The small brown chrysalids are enclosed in small white cocoons about one-half inch long. The moths average from one-half to three-fourths of an inch long and are readily distinguished from the other food infesting moths by the distinctive two-colored pattern of silvery gray and bronze; the anterior portion of the wings being silvery and the posterior half bronze or coppery. The very minute eggs are laid on or as near the dried fruit as possible mostly at night. This moth is the one most often found in the hold over dried fruit or in the refuse boxes in packing houses and is almost sure to appear in any fruit which has been kept, especially in a store or warehouse for several years. Because of its general feeding habits, it is a very great nuisance in public warehouses and in stores where so many kinds of food are stored and where some at least is likely to be infested with the moth when brought into storage. As a rule such places always harbor the pest and clean products will invariably become infested. Besides feeding in the fruit the caterpillars are often found in loose cocoons or webs in the corners and cracks of the packing houses during the winter months and emerge as adults in the spring and early summer. They can easily remain over from crop to crop without difficulty so that a house once infested will remain so unless a thorough clean-up and fumigation is resorted to.

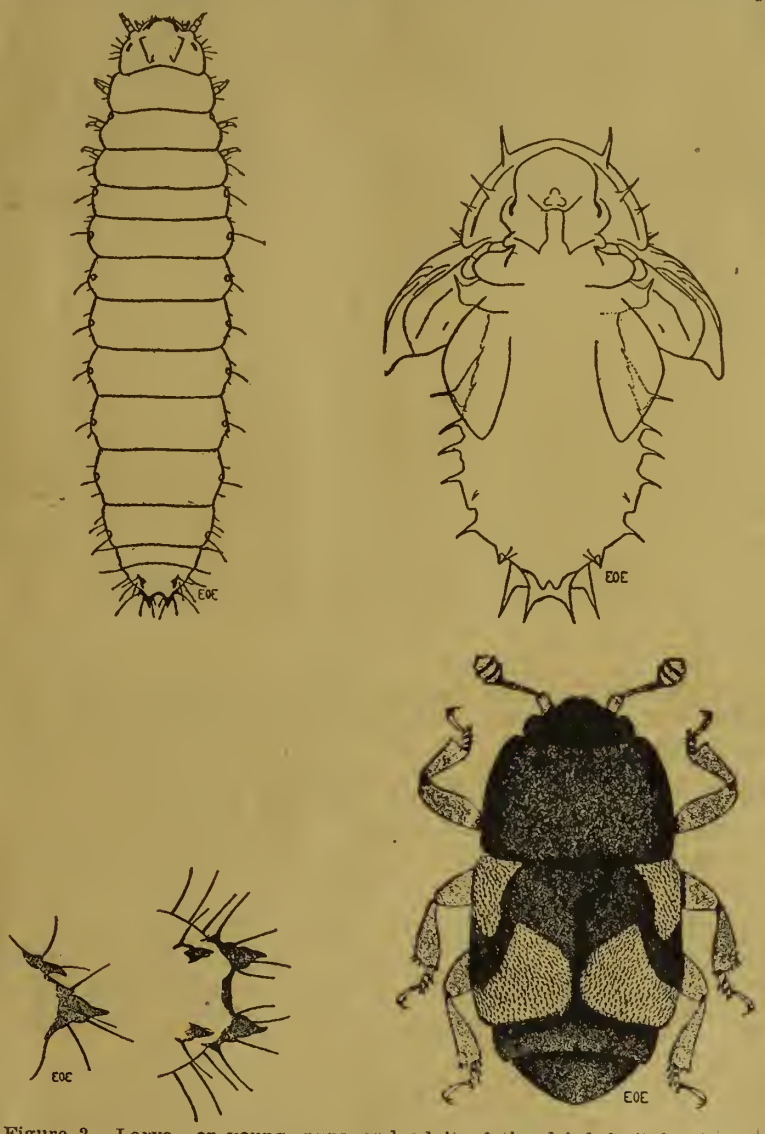

Figure 2. Larva or young, pupa and adult of the dried fruit bettle. Author's illustration.

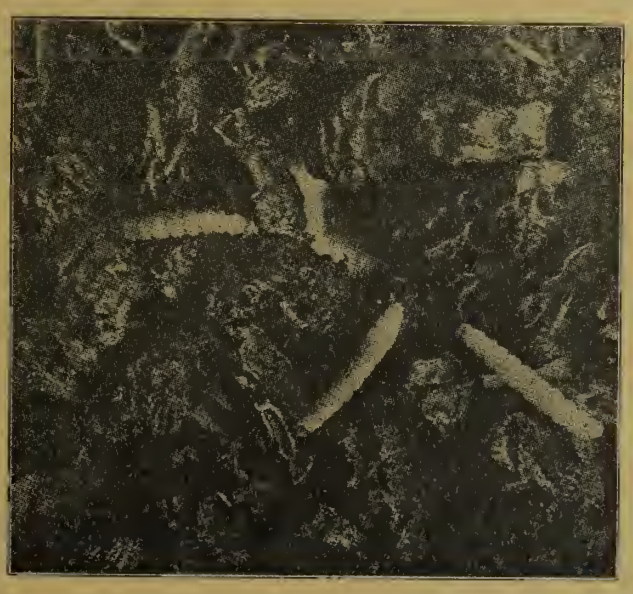

Figure 1. Larvae or young of the Indian meal moth in packed raisins. After Bioletti.

The Fig Moth

The fig moth, Ephestia cautella Walk., has been repeatedly introduced into this country in Smyrna figs and has become established in many sections. Its work is much like that of the Indian meal moth already discussed and it freely attacks cereal products, nuts, seeds and dried fruits. As yet it has not become established in California and is a pest we should be on the lookout for and guard against in every way possible.

Beetles Infesting Dried Fruits

The larvae or young of the beetles infesting dried fruits are easily confused with the caterpillars, but may be easily recognized by the presence of only the three pairs of true legs and the absence of the fleshy prolegs and their inability to spin webs. They work their way through the fruit and when mature pupate directly in the food and emerge as small beetles which are very active on foot and wing. Like the moths they have marked ability to search out food and to place their eggs directly upon it or in its near vicinity. They also develop very rapidly except during the cooler winter months, which does not interfere much if stored in a warm warehouse.

Dried Fruit Beetle

The most injurious beetle to dried fruit in California is the dried fruit beetle, Carpophilus hemipterus (Linn.). The larvae are small and whitish yellow while the adults are short and robust, scarcely one-fourth of an inch long, black with the posterior portions of the body a reddish or cinnamon brown. The larvae reduce the fruit to a fine powder or frass which is the excrement left behind. This insect ordinarily infests the fruit while it is still upon the trays in the drying yards and is thus carried into the packing houses where it may easily become distributed throughout the plant and generally infest the fruit. It is specially common in the central valleys and the southern parts of the state.

Agricultural News Notes of the Pacific Coast

Northern California

Fall River Mills, Shasta County, has decided to hold a community fair.

Tehama County farm bureau has just been increased by 100 new members.

The state normal school at Chico is conducting a junior college department.

The farm bureau of Butte County has established an employment office at Chico.

Placer County farm bureau meetings: Applegate, February 16; Weimar, 18.

Tehama County has a farm bureau market department which is proving of great value to the producers.

The new rice mill of the Sperry Company at Chico will have a capacity of 2,000 bags milled rice per day.

Breeders of registered livestock met at the Palace Hotel in San Francisco, February 7, to form a state association.

More eggs have been shipped out of California so far this year than in any similar period; 22 cars were shipped out last week.

Stockmen of Indian Valley, Plumas County, have formed a livestock association, electing W. B. Perry, and G. L. Curnow, secretary.

Professor W. T. Horne has just completed examination of citrus groves in Sacramento County and reports finding no trace of citrus blast.

The Western Fruit Jobbers Convention is meeting at San Francisco this week. Among the speakers will be Herbert Hoover and J. L. McNab.

At the recent annual election of the Franklin Center of the Sacramento County farm bureau, Adolph Kloss was elected president and Eugene Frye, secretary.

A convention of all those interested in fruit drying was held at San Jose February 7. Discussion was principally on types and erection of dehydrating plants.

Wine grape growers have been given warning not to be too anxious to contract for wine grapes for many shrewd observers believe that prices are still due to advance.

County Horticultural Commissioner Winkelman of El Dorado County reports 1919 shipments of fresh fruits as 406 carloads. Three hundred and forty-nine cars went East.

A majority of the warehouse companies of the state storing rice have come to an agreement with the Pacific Rice Growers Association to charge $2 for handling paddy rice.

It is estimated that the rice acreage in Colusa County this year will be increased more than 20,000 acres. One irrigation district will bring over 10,000 acres into rice planting.

Director Hecke of the state department of agriculture, has appointed Theo. D. Urbahns field entomogist. Mr. Urbahns was formerly with the United States department of agriculture.

A suit brought by the Security Investment Company of San Francisco against a firm of olive packers in Butte County has been decided in the plaintiff's favor. The suit called for $5,000 damages for failure of the packers to accept olives contracted for. The packers claim the olives were damaged by frost.

Central California

Tulare County reports heavy shipments of vines and nursery trees.

Irrigators in the Turlock-Modesto irrigation district are now following winter irrigation.

Santa Cruz County supervisors have been requested to appoint a county bee inspector.

The Merced irrigation district has appointed J. B. Galloway chief engineer of the district.

Several Stanislaus County farmers have made filings with the state water commission on waters of the San Joaquin River.

Fancher Creek nurseries of Fresno have purchased tracts of choice land south of Tulare for the growing of nursery stock.

Monterey County horticultural commission has been conducting an anti-squirrel campaign. Poison has been spread on over 15,000 acres.

The Santa Cruz County farm bureau is considering the advisability of asking the county supervisors to enact a foul brood bee inspection ordinance.

The Oriental Exclusion League is preparing initiative petition for a law which will prevent Orientals from owning or leasing land in California.

The Fruit Growers Association of Corralitos, Santa Cruz County, has decided to commence erection at once of a drying plant to care for its fruit.

Farmers of western San Joaquin County are organizing the West San Joaquin irrigation district which it is hoped will cover about 200,000 acres of the West Side.

Dairymen of Monterey County recently met at Soledad and witnessed movie pictures showing up-to-date dairy methods and discussed more efficient handling of milk, butter and cheese.

The California irrigation board is holding hearings on the application of Miller and Lux for establishing a 105,000 acre irrigation district, largely within Kern County. The farmers want the district to comprise about 400,000 acres.

San Joaquin Valley irrigators who depend upon pumping from wells are now irrigating, using electricity at night so as to save electricity for lighting purposes. The situation is becoming serious and steps are being taken to conserve so far as possible.

The Associated Raisin Company is making its second payment of three cents per pound on Malagas, Muscats and Feherzagos and four cents on Thompsons and Sultanas. The original payment was five cents for Malagas, Muscats and Feherzagos and eight cents for Thompsons.

Heavy plantings of walnuts throughout the San Joaquin Valley have completely exhausted all available nursery stock according, to nursery firms in this section. An effort is being made by the Fresno chamber of commerce to bring all walnut growers into the Walnut Growers Association.

Checks amounting to $11,000,000 comprising the second payment for the 1919 raisin crop are being mailed out by the California Associated Raisin Company. The amount represents the greatest second payment in the history of the industry. Approximately 9,000 growers will share in the dividends.

Southern California

Imperial Valley is shipping asparagus.

Contract has been let for highway from Brawley to Indio.

All Southern California has been visited by heavy rainfall.

Antelope Valley, Los Angeles County is making test plantings of cotton.

Riverside County farm centers are holding special lemon pruning demonstrations.

Big crowds are attending the National Orange Show at San Bernardino this week.

A regional farm bureau meeting was held at El Centro, Imperial County, February 16.

Lemon prices are becoming rather spectacular, some sales having been made around $10.

Potato planting is proceeding in all sections of Southern California but handicapped by lack of seed.

Walnut growers of Los Angeles County are holding meetings discussing winter injury to walnuts.

About 1,000 tons of prunes were grown in the Banning district of San Bernardino County last season.

F. Q. Story, for the past 16 years president of the California Fruit Exchange, has resigned his position.

Walnut growers of the San Fernando Valley will organize a walnut growers association at Lankershim.

The alfalfa growers are launching extensive campaign for new membership for their marketing association.

Cover crops in citrus groves are being turned under and disked because of fear that later rains may not come.

Riverside bee keepers are taking steps to stop wintering of colonies of Middle Western bees in Riverside County.

Members of the Indio center of the farm bureau have organized a cotton division. Growers estimate that 3,500 acres of long staple will be planted in the valley this year.

The Riverside Press suggests that with the establishment of new canneries in many sections of the county this year it would seem advisable for many growers to get busy and set out deciduous fruit trees.

Engineers report the floor of the Colorado River is two feet higher than at former sounding a few weeks ago. The reports from headwaters in the Rocky Mountains indicate there will be greater run-off this year than last.

Records of the Pacific Fruit Express show that during January that firm shipped out from Brawley, Imperial County, 533 carloads of produce. One hundred sixteen carloads of lettuce was the heaviest shipment of one product.

Los Angeles County farm center meetings: Covina, for discussion of scaly bark, February 21; Burbank, 23; Little Rock, 24; Del Sur, 25; Roosevelt, 26; Newhall, 26; Owensmouth, 26; Pomona, 27; Inglewood, 27; Glendora, March 1; Downey, 1.

Dr. Maynard Rosenberger, for many years in charge of milk inspection of the health department of Los Angeles, has tendered his resignation to take up other work. Dr. Rosenberger has given to Los Angeles the purest milk of any city of its size in the United States.

The Coast and General

Mesa, Arizona, recently held a dry farming conference.

Cotton picking has been completed in the Salt River Valley of Arizona.

The bureau of entomology of the U. S. D. A. reports 36 states as more or less infested with grape phylloxera.

There are 160,000 head of reindeer in Alaska. The first of these were brought into the territory in July of 1892.

The American Berkshire Congress will be held this week at the Kentucky agricultural experiment station, Lexington.

Oregon has been given more moderate temperatures and increased rains which has stimulated farming operations.

Northern Arizona stock ranges were recently visited by a heavy fall of snow, causing some loss. The desert forage of the South is reported excellent.

Notwithstanding the serious situation in pastures of the Coast Range and Sierra Nevada it is now reported that losses from starvation have been greatly overstated.

Over 4,000 cars of California fresh wine grapes were shipped to Eastern states during the last shipping season. These were largely used in making of unfermented juices.

Arizona's livestock has a value of $81,895,000, an increase of $1,967,000 over a year ago, according to a survey of the state which has just been completed by L. M. Harrison, Arizona field agent of the bureau of crop estimates.

Long staple cotton sold at 90 cents a pound on the Phoenix market last week, a high water mark. A considerable amount of long staple cotton in the valley yet unmarketed has been consigned to the East where it is expected that at least $1 will be received for it.

A fund of $110,000, state and federal funds, will be spent in reclaiming lands in Arizona. With the $10,000 donation from the federal government, and the $100,000 state reclamation fund, work will be accomplished, it is expected, on the Virgin River and the San Carlos projects. The former is to include a storage dam in the Colorado below its confluence with the Virgin River.

The annual meeting of the members of the American Cotton Association has been called by President J. S. Wannamaker to meet in Montgomery, Alabama, February 17-20. This will probably be one of the most largely attended and most important conventions ever held in the South. Many subjects of intense interest will be discussed and definite action taken upon them at the convention.

A record cotton yield apparently has been made by Ernest A. Leitzel of Glendale, Arizona, judging from figures quoted by him. On 3 4-5 acres he harvested six bales and 86 pounds of seed cotton, or in other words, 2,860 pounds per acre, which was sold for $2,487.52, or at the rate of $654.61 per acre (gross). The chamber of commerce, which has two other high yields under consideration, announced that it was difficult to reach an exact calculation because of the consideration which must be given the lint and seed figures.

Keeping the "Move" in Your Motor

By James De Camp

THERE is one fundamental difference between the horse and the automobile. The former was created by Almighty God while the latter is a product of the ingenuity and patience of man. In the last analysis they are both formed from the same basic elements of earth to which all things must ultimately return.

If we stop to think it over we will find that there are many similarities between the living beast of burden and his mechanical successor. The old bay mare and the stocky draft team had carburetors, valves, circulatory and eliminating systems, universal joints, bearings, bushings, shock absorbers, cooling and breathing devices and, when harnessed, were controlled by a sort of steering gear!

These various units of the entire assembly were designed to function with a minimum of care and attention and to continue their services until the natural days of the beast were terminated by accident, illness or old age.

The farmer making his first shift from hay consuming transportation to the gas burning variety finds himself confronted with a multiplicity of details that at the first seem confusing and involved. He was accustomed to feeding and watering Dobbin and letting it go at that, with occasional recourse to the services of the blacksmith and veterinarian.

He finds that his new automobile is provided with an ingenious folding cover device called a hood. By tinkering with a couple of patent fasteners he can lift this metal canopy and look upon the queer combination of metal parts that conspire together to whisk him back and forth across the countryside. In the car the new owner finds an instruction book which seems loaded from cover to cover with cabalistic information and insistent demands that this or that portion of the machine must have regular attention or dire results will come to pass.

The problem is not really as complicated as it seems. Every person who has driven a car long enough to become initiated into the mysteries of ownership knows that there is one magic word which will keep grief and repair bills as scarce as ice factories in Greenland. This amulet is—Lubrication.

Every good instruction book contains what is known as a lubrication chart, an outline drawing of the chassis, calling attention to the places needing lubrication and stating the frequency with which these spots should be attended to. A number of motor car manufacturers will provide on request an enlarged copy of this chart, suitable to be posted in the barn or garage. A new owner should pore over this information so thoroughly and persistently that each of its details will be as thoroughly rooted in his mind as the names of his family and the addresses of his debtors.

By rigid and complete observance of the lubrication schedule, coupled with reasonable consideration in driving, it is safe to say that the average life of a car may be prolonged two years. This is a fact worth tacking on the inner wall of one's derby in these days of rocketing prices and scarcity of machines.

The buyer of a new car should provide himself at once with the oils and greases which will be needed to keep his outfit running at top efficiency. The most important item in this purchase is the lubricating oil which is to be used in the crank case and forced through the bearings and over the wearing surfaces of the motor by the oiling system. There are nearly as many kinds of oils to be had as there are profiteers ranging loose in our native land. However, the brands and densities suited to your particular car can probably be told off on the fingers of one hand.

Ask the agency where you purchase the car what oil they use and recommend and which grade of this oil is preferable for summer and winter use. They should know which products will give the best service and leave a minimum carbon deposit in the combustion chamber. Several of the large refining companies have employed experts to investigate the peculiarities of each make of car and determine what qualities of oil should be used in the various seasons. A postcard to any of these organizataions will bring you the information you require.

The man who lives in the country will find it to his interest, both for convenience and economy, to purchase oil in large quantities. A substantial saving can be secured in buying by the five gallon can or the 25 gallon drum. California conditions usually call for an oil of medium density during the winter and one of greater body to withstand the heat of summer days. In Eastern states extremely light oils are used during the winter to avoid freezing in the crank case and clogging of the oil pump and feed pipes.

The second item in the car owner's lubricating outfit is an inexpensive but important one, a can of good quality cup grease. The lubricating chart will show the location of the grease cups and how often they should be turned down. When filling a cup use a knife or a small wooden paddle. Do not gouge into the grease with the cup itself since this may introduce dirt and grit into the lubricant and will also gum up the exterior of the cup for future handling.

A pail of transmission lubricant and a small quantity of graphite comprise the remainder of the equipment. The instruction book should specify the nature of the lubricant to be used in the transmission (gears). This same material is often adaptable to the differential as well, although some makers suggest that a special grease be used for the latter. Steam engine cylinder oil often proves ideal for transmission and differential and in some cases is used to lubricate the clutch collar as well. The graphite is spread between the leaves of the springs to insure easy riding and minimize jars

(Continued on Page 289.)

Water Development in California

By Commissioner W. A. Johnstone

THE state water commission of California has recently compiled data which shows in a striking manner the resumption of activity in agricultural and hyrdo-electric power development during the past year. Not only does this data indicate a return of normal activities, but it shows in addition an increase of nearly 40 per cent over the average for the past five years. California is launching upon a period of unprecedented development.

The state water commission has supervision over the use of unappropriated waters of California. These waters were declared to be public property under the water commission act which went into effect December 19, 1914. Under this act applications must be filed with the commission for permit to use unappropriated water. The principal applications received are for irrigation and generation of hydro-electric power, but the demand for mining and municipal uses is also considerable. During the six months ending December 31, 1919, 62 per cent of the applications received were for agricultural, 30 per cent for power, six per cent for mining and two per cent for municipal uses.

The relative number of applications received by the commission is a reliable index of the general business and financial condition throughout the state. The data for the period since the commission was organized in 1915 has been made available in the form of a diagram showing the number of applications for permits which have been received monthly. The outstanding facts shown by this diagram are the influence of the war and the resulting high prices upon agricultural, power and mining development in the state. Prior to the active participation of the United States, there was a normal increase from year to year with a periodic summer peak. In 1917 the peak did not reach its anticipated climax but fell off rapidly immediately after the declaration of war in April. The efforts to stimulate food production resulted in a partial recovery late in 1917 which reached its climax early in 1918. The average for the year 1918, however, was 18 per cent less than in 1916 and 15 per cent less than in 1917. The month of the armistice, November, 1918, produced a sharp decline with a minimum below that of any previous month in the history of commission. The subsequent recovery has been rapid, the rise continuing steadily to December, 1919. The number of applications received during December, 1919 was 33 per cent greater than in any previous month, and for the year was 37 per cent greater than the average for the past five years. This unprecedented activity is the result of the prevailing high prices for agricultural products and the more intensive cultivation of the soil by means of irrigation.

The applications are for widely varying amounts of water and for the irrigation of from a few acres by homesteaders in the hills to several hundred thousand acres by irrigation districts in the San Joaquin Valley. The extent of the immediately proposed agricultural development in the state is indicated by the fact that the total area of land for the irrigation of which applications have been filed during the six months ending December 31, 1919, is 2,140,000 acres. This area is 22 per cent of the total irrigable acreage of the state for which water is available and is more than one-half of the present irrigated area. The lands applied for are principally in the great valley of Central California and include the Merced, Madera, San Jose, proposed Kern Delta, and other large irrigation districts in the San Joaquin Valley, as well as rice lands in the Sacramento Valley.

Hydro-electric power development is fully as active as agricultural development. For the same six months period applications were received for permits to divert water to generate 2,103,000 theoretical horse power, largely on streams tributary to the San Joaquin Valley. This quantity is 26 per cent of the maximum ultimate power development of the state as stated in the report of the United States commissioner of corporations in 1912. The largest proposed installations are those of the Southern California Edison Company on the San Joaquin River, totaling more than 1,000,000 theoretical horse power at nine power plants, two of which are already in operation. Others are the San Joaquin Light and Power Corporation plant on the San Joaquin River with 33,000 horse power; the Modesto and Turlock irrigation district plant on Tuolumne River with 45,000 horse power, and the Mokelumne River Power and Water Company on South Fork Mokelumne River with 32,250 horse power.

This phenomenal increase in the use of the waters of the state brings forcefully to attention the absolute necessity of the storage of surplus waters for use during the periods of shortage. This is necessary not only for irrigation but for power development, and most of the applications filed with the commission include storage of greater or lesser amounts. The acuteness of the situation is indicated by the fact that even in the Sacramento Valley during the late summer a shortage is imminent in the flow of the Sacramento River. The normal flow of the river is being appreciably reduced each year by the increasing amounts used for the irrigation of rice. If this industry continues to expand as it has during the past four years, storage must be provided. There is strong probability during the coming season not only that the river will be largely diverted, but that a considerable acreage will be without water during the latter part of the growing season, unless a limit is placed upon the acreage planted.

The difficulties of financing large storage projects and the diverse interests depending upon the use of storage water, both point to the desirability of the construction and operation of large reservoirs by the public. The federal government is not prepared to undertake storage projects on a broad scale in California, principally because of lack of funds. The logical procedure is for the state to undertake such enterprises.

Guavas in California

By Ernest Braunton

GUAVA culture in California is attended with but one difficulty and that is climatic. The Paraguay guava, Feijoa Sellowiana, is hardy throughout the state and in parts of Oregon. The strawberry guava, Psidium Cattleianum, will stand 22 degrees when in active growth and several more if the plants are large and the wood well ripened. The large yellow lemon and pear guavas should be planted only in practically frostless spots.

The latest introduction, and the hardiest of the group, is the feijoa, found in a wild state in a wide region of South America, but principally in Paraguay, and the latter country gives it the name in common use in South America. It has thriven as far north as Eugene, Oregon, to our own knowledge and may be hardy in still colder sections. In California the shrub will thrive, as do other guavas, in almost any kind of soil. Those grown from seeds range so much in size, flavor and other points that one is not justified in planting them. After several years' trial at the H. E. Huntington ranch near Los Angeles, a two and a half acre plot of them is now being cleared and the plants burned. Splendid types may be had in a half-dozen budded and named varieties, and no others should be planted.

Other Species

Next to the feijoa in hardiness is the strawberry or Cattley guava, a prime favorite over a large part of California. If it has any choice of soil I have been unable to determine what is best. Years ago I had 65 old bushes at Glendale, Los Angeles County, growing on a loose shale bench where six inches of good soil had been brought in so they could gain a foothold. The bushes grew fairly well and under the stimulus of water and stable manure produced a very heavy crop of fruits. In heavy deep garden soil they will thrive if drainage is good. In sandy soil they satisfy if well fed. Even in this species the range of excellence is considerable and we have great need of named varieties, either through grafting or growing from cuttings. There is also one called the yellow strawberry guava, or variety lucidum. The flavor of this one is a little milder than that of the red, yet it is an excellent sort to grow

A number of forms and flavors lurk under the botanical name of Psidium Guajava, but the two varieties known in California are popularly named lemon and pear guava, by reason of their respective forms. Neither are hardy except in spots usually claimed to be frostless. During the past winter, however, some are known to have experienced several slight frosts, for in midwinter they were gathered in a ripe state by the writer and the larger or pear type is herewith illustrated. Few persons care much for these in a fresh state but in all tropic and semi-tropic climes they are preferred to all others for the making of jams and jellies. This pear shaped type is the largest of guavas and those photographed were two and a half inches in diameter. They were grown in black adobe soil that had never been fertilized, and received no care aside from destruction of weeds.

Pear Guava; Largest Guava Grown in California
This fruit has a future for protected sections where there is little danger of frost.

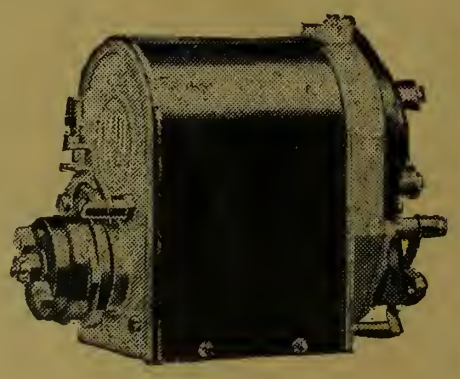
Ready Power for Odd Jobs

THIS I. H. C. Titan Tractor is ready in a minute for any work—belt or draw bar.

The odd jobs like clearing land, grinding feed, sawing wood, make the tractor profitable the year around.

The K-W Magneto guarantees an instant start and steady power in any weather—on any fuel.

Buy your tractor to work the year around—equipped with a K-W Magneto which starts the tractor without fussing even in zero weather, and makes it pay dividends every month in the year.



THE K-W IGNITION Co
2895 Chester Ave. CLEVELAND OHIO, U.S.A.

TRADE K-W MARK Magneto

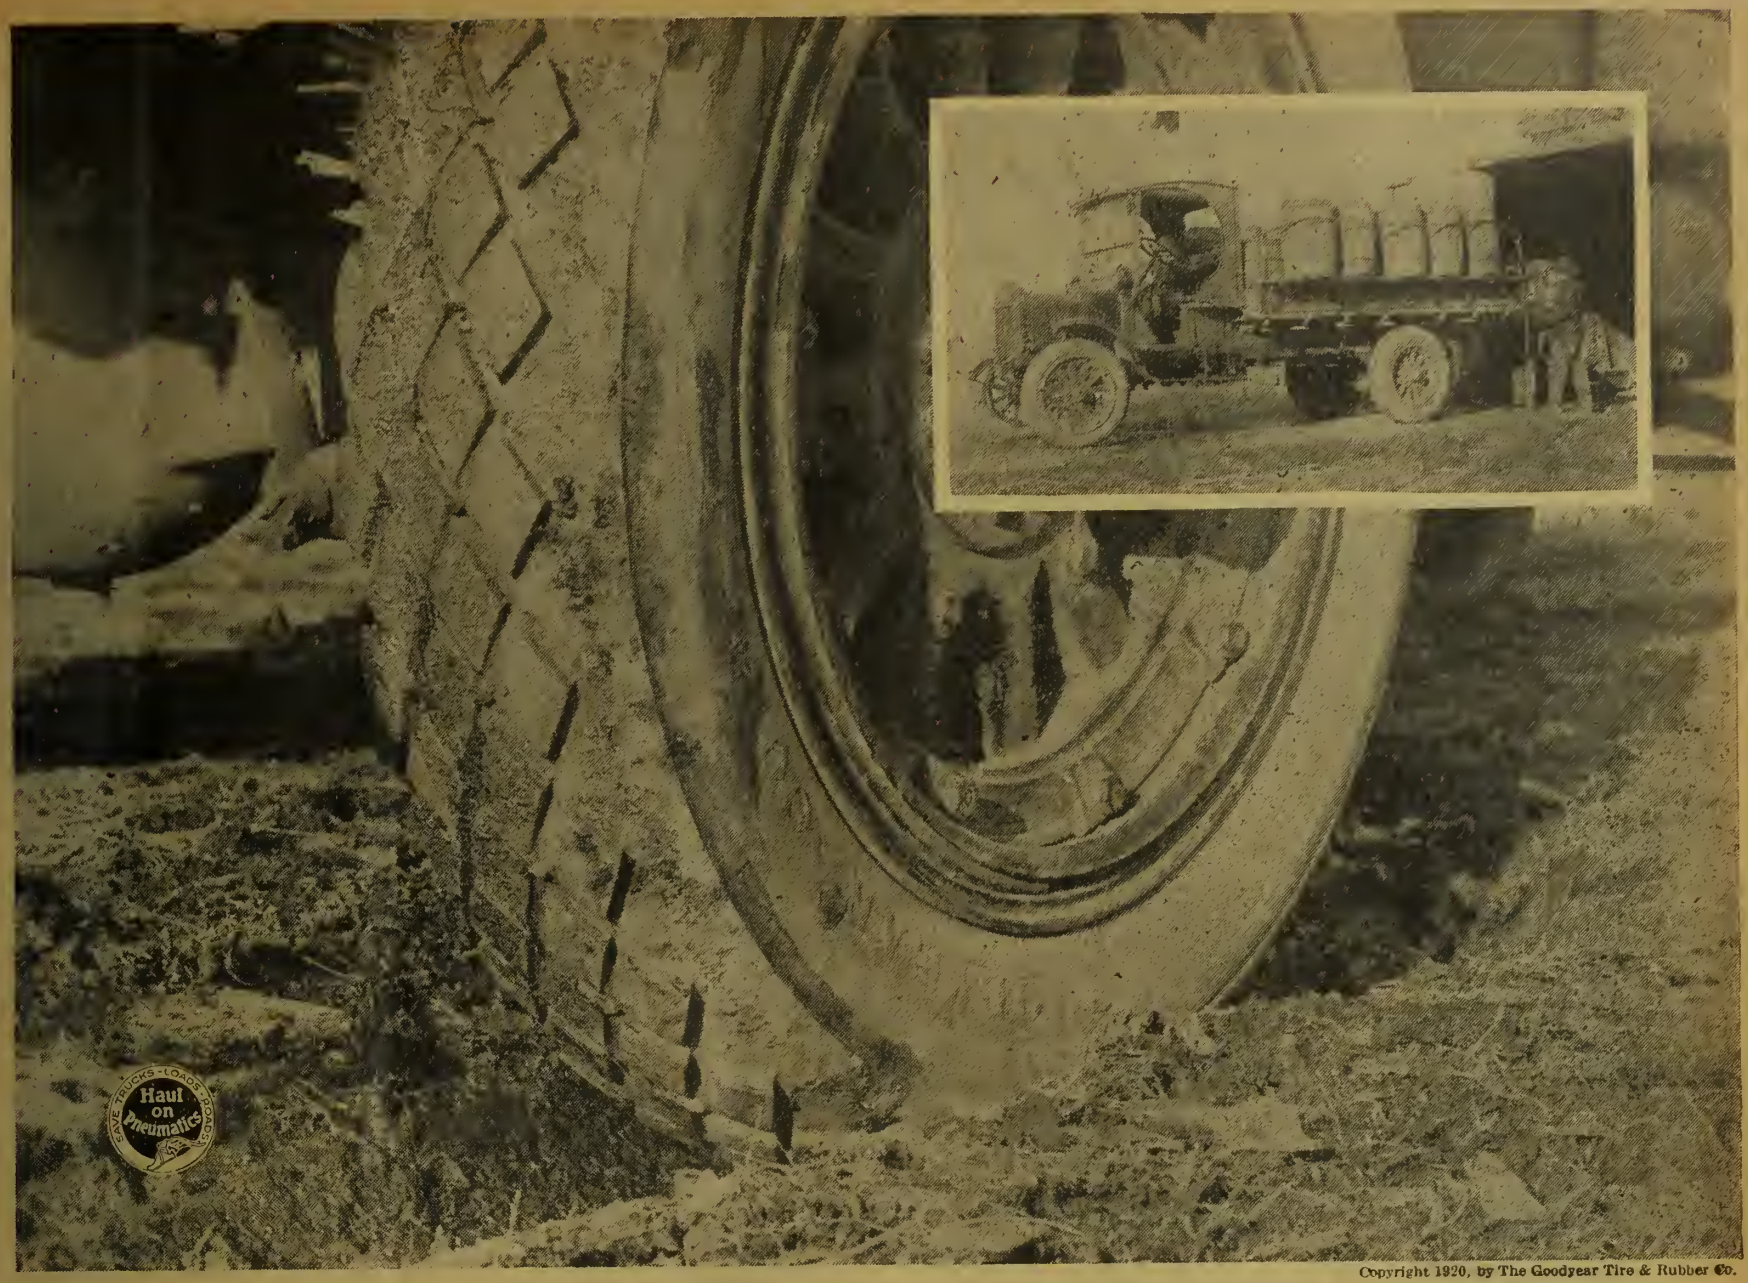
Fires Any Fuel—Gets Maximum Power Out of Every Drop

FLORIDA ORANGES

E. M. Chace, chemist in charge United States branch laboratory at Los Angeles, has just returned from several months study and observation in Florida. Asked if there was any marked change in the varieties of oranges grown as against those 1 ading a few years ago, he said he did not discern any. The industry appears in good healthy condition, with seedling groves still leading in production. The acreage in Valencias is increasing, and close to this comes the Pineapple. The Lue Gim Gong is quite a favorite in present planting as it is a late Valencia and claimed by the introducers to be superior in other respects. At Orlando, Mr. Chace saw a new orange called Temple for which much is claimed. It was not ripe at the time he left there, but states it is a fine looking fruit and the deepest color of any orange he has seen in Florida. The Etrog, or sacred Jewish citron, is grown in Florida but not in California and Mr. Chace expressed the hope that it might be introduced. It is grown principally in the island of Corfu and used by the Jews at the Feast of Tabernacles. The small greenish yellow fruits, if they are of exactly the prescribed size, form and color, may bring as much as $5 to $10 each, according to Walter T. Swingle, in the Standard Cyclopedia of Horticulture.—E. B.

PINEAPPLE WILT

Florida is experiencing a severe blow to the pineapple industry, one that bids fair to wipe it entirely away. The plants are attacked by a wilt which so far has not been in the least controlled. The acreage of pineapples is therefore the smallest since the industry was launched. There are about 25 acres on the west coast near Punta Gorda and about 50 acres on the east coast from Vero down to Stewart. No canneries are in operation and the growing of the pineapple is about at an end. In the Indian Ri[illegible]ntry, south of Titusville, the or[illegible] planting section, there are n[illegible]ntso-ever.



Copyright 1920, by The Goodyear Tire & Rubber Co.

"Because I use a truck on Goodyear Cord Tires I load potatoes, onions, etc., in the fields and haul to Louisville, 12 miles, in 50 minutes. Horses take 2 hours. The pneumatic-tired truck saves much labor and expense on my two farms totaling 180 acres."—Jacob Rupp, Farmer, R. F. D. No. 1, Louisville, Kentucky

THERE are farmers everywhere throughout this country today who have practically duplicated the experience related above by this Kentuckian.

They have proved that Goodyear Cord Tires free them from slow hauling, either by horses or solid-tired trucks, and thus free them from one of the worst handicaps ever placed on farming effort.

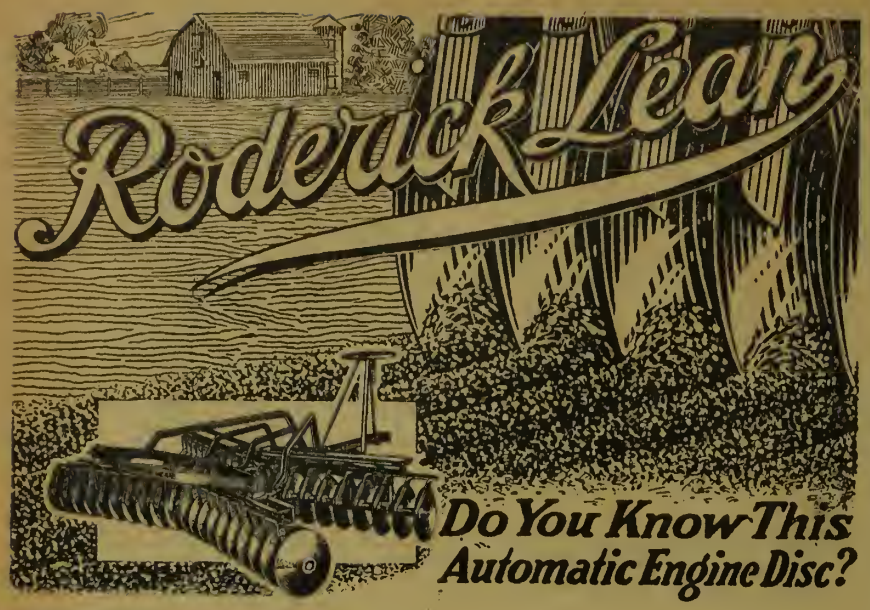
The use of the spry Goodyear Cords has the effect of moving a farm closer to town, of speeding up the other power-driven machinery on it, and so of getting each day's work done most easily and quickly.

Thus the perfected pneumatic truck tire is a powerful factor in that progress which not only is increasing decisively the income of the farmer but also is making his activities far more pleasant.

Its traction, cushioning and nimbleness have been made thoroughly practical for farm trucking by Goodyear Cord construction which adds a tremendous toughness well known to rural users of Goodyear Cord Tires.

Accurate information detailing the results attained by farmers, ranchers and country motor express lines with pneumatic-tired trucks can be secured by writing to The Goodyear Tire & Rubber Company, at Akron, Ohio.

GOODYEAR
CORD TIRES



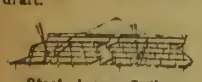
HAVE you seen the Roderick Lean Automatic Engine Disc at tractor demonstrations or at work on a neighbor's farm?

If not, see your Roderick Lean dealer at once or write to us. Make sure of a perfect seed bed this spring, by discing right. Quick, thorough, and profitable discing--that's what the Roderick Lean Automatic Engine Disc is built to do--***and does.***

Once over with this disc puts your field in prime shape for planting. Because it is absolutely automatic, adjustment is easy and convenient. Gangs are angled automatically by draft of the tractor. The operator has full control within easy reach, without stopping tractor or leaving his seat.

For a perfect job of discing, with smallest amount of labor and greatest saving of time--you need this Roderick Lean Automatic Engine Disc.

Spring Tooth Harrow
Has heavy, one-piece angle steel frame with extra runner plates to prevent wear, long spring teeth of special steel, and special adjustable tooth fastening device. Good clearance and light draft.



Steel Lever Spike Harrow
The first steel spike tooth harrow ever built, and the best known and most widely imitated. Every ounce of special steel. Every section surrounded by strong channel steel frame, braced at two corners and center. Cannot twist.

We will gladly send you detailed information and name of nearest dealer on request.

Roderick Lean Mfg. Co.

Builders of the most varied line of harrows in the world, including a complete line of spike and spring tooth Harrows.

Mansfield, Ohio

General Agents:

H. C. Shaw Co.
Stockton, Cal.

B. Hayman Co., Inc.
Los Angeles, Cal.

"New Century" Engine Disc
Furnished in 5, 6, 7, and 8 ft. sizes for use with lighter tractors. Built extra strong for power use. Operated from tractor seat by two levers within convenient reach. Adjustable hitch suits any standard light tractor.

"New Century" Single Disc
Furnished in any size from 4 to 10 feet. Strongly built and braced. Has working features not found on other single discs. Flexible trailer can be furnished in 5, 6, 7 and 8 ft. sizes.

PRUNING GRAPE VINES

(Continued from Cover Page.)

before he uses the shears at all will bring the cane to the stake in order to find out whether he can do so without breaking it. It is not seldom that the cane breaks off, especially if the man goes at it in a careless way, but as long as there are other canes left, no great harm is done. If the canes are very thick it may be necessary to give the cane a gentle twist; it will split open in a longitudinal direction, which will not injure it permanently, and the same cane can be put against the stake in the desired position.

First Pruning

All the stakes being equally high, the cane is cut off, usually about the top of the stake, but it is desirable to leave as much internode above the last bud as possible. This piece of internode is usually made use of when the cane which is to form the stem is tied to the stake. After the selecting of tbe stem all the canes, regardless of how vigorous they may be, are removed as closely as possible. If we should happen to leave a little stub one-half inch or less long we would find that in due course one or more new shoots will commence to grow. Very often we will notice shoots which have their origin below the surface of the ground; in such cases it will be absolutely necessary to dig down with a spade, find the place where the shoot originates and remove it as near the base as possible. If this work is done very thoroughly the first three or four years the less trouble there will be later on. If the canes are short and thin and none can be used for the formation of the stem, then the grape vine has to be treated as last year, that is, all shoots except the most favorably placed one are cut off as close as possible and the one left is cut to two buds.

As soon as the vine starts to grow a good number of buds commence to grow, but before they get very large, those not desired should be removed. This should be done when the shoots are two or three inches long. When done at this time the shoots can be rubbed off and very little injury will result. All shoots should be removed except the two which are nearest to the stake. These will grow very rapidly and in order to protect them from being broken off by the wind one of them should be tied loosely to the stake; as the young shoots are very brittle, great care should be exercised in doing this, and as we use only one stem the other shoot can be removed too.

Within three or four weeks the young shoot which was tied to the stake will have made a growth exceeding the height of the stake by 12 to 18 inches. All vines which show such a development should be topped, that is, the young shoot must be cut back to about 18 or 20 inches and securely tied to the stake. Having removed the upper part of the young growth, we will now get a given number of laterals which we need for the formation of the head.

We will find laterals right down to the surface of the ground. The lower ones are not needed and should be pinched back, leaving one or two leaves which will shade the stem and can be removed during the next winter pruning. The same treatment should be given to the vines where the canes were tied against the stake. Sometimes the laterals may grow too vigorously and in windy locations the danger exists that a number may be broken by the wind. Under such conditions it would be advisable to pinch out the tip of the young laterals when they are, say, 15 inches long. Only one or two inches of the extreme growth should be taken off. This operation will cause the vine to force secondary laterals and will strengthen these so that they will be more resistant to the wind. In order to do this work well it will be necessary to go over the vineyard three or four times, sometimes even more often.

Second Year Pruning

The winter following, the grape vines, if they have been treated as above, will have made a good growth consisting of a number of well matured canes. The pruning to be pursued from now on will deepnd upon the fruiting habit of the variety. In the case of the Muscat we should prune the canes back to spurs, leaving two or three buds to each spur. The number of buds per spur will depend on the thickness of the cane. If the cane is very thick we can leave three buds; weaker canes get two only and thin canes only one. In counting the buds, the base bud is never considered.

Sultanina

If we have to deal with the Sultanina (Thompson Seedless) which have made a good strong growth, it may be possible to leave one or perhaps two canes. This applies to very strong plants only. It is a great mistake to have bearing canes on weak vines for we should bear in mind that we have to get a good strong vine first and get the grapes afterwards. Unfortunately a good many growers lose sight of this important fact. In addition to that most of the people do not realize that in pruning Sultanina we must prune for two things, one just as important as the other—fruit production and wood production. If we would prune a Sultanina like a Muscat, that is to say, to short spurs, we would get a large amount of canes but very few grapes. This is due to the fact that the lower buds of a year old well matured Sultanina cane are not very fruitful; the upper buds are. Hence, in order to get a full crop of grapes, we are forced to leave long bearing canes which have to be disposed of in such a manner that they will not interfere with the cultivation, irrigation, etc. Grape vines bear grapes on one year old wood only, hence we must always make provisions for a good supply of bearing canes for the next year, and this can only be accomplished by pruning a certain number of canes to wood spurs having only one bud. The question arises now, how many canes shall be left and how long shall they be? This is perhaps one of the hardest questions to answer without seeing the vines. Very often growers imagine their grape vines are strong and vigorous but when one goes there and looks at them they are anything but that. The average experienced pruner, before he starts to prune, is going to ask himself the question: Has this vine made a good growth last year? He has the plant in front of him, he selects his canes for fruit bearing and prunes accordingly. If the vines are planted, say, six feet by 12 feet, he will make his fruit canes about three feet long. The number of canes will depend entirely upon last year's growth. If, in pruning older Sultanina vines, four canes were left last year, the vine made a good growth, and produced a good crop of grapes, there is no reason why four canes should not be left this season. On the other hand, if the canes are short and thin, badly matured, and if the vine has made a poor growth due to overbearing, lack of moisture, or cultivation, etc., the vine has to be pruned shorter. Two canes only should be left, and sometimes less.

The rest of the canes are pruned to one bud spurs, so-called wood spurs, and if there are too many, a few of them may be taken out altogether. Muscat vines of bearing age are always pruned to spurs which will gradually elongate the arms to such an extent that they will interfere with the cultivation, and, in order to facilitate the working of the soil, these arms have to be shortened. If this is not done at the proper time, a great deal of damage will be done by the plow and other implements.

In order to shorten the arms, we always must make use of a one year old cane growing on the same arm as closely to the center of the head of the vine as possible. If this cane is weak, we prune it to one bud, and while we are growing our grapes on the spur or spurs at the end of the arm, we are developing a strong cane which can be made use of in replacing the arm the winter following. The whole arm is cut off as closely to the renewal spur as possible.

Trellising

Grape vines, such as the Muscat, when properly trained the first three or four years, will not require any more stakes. With the Sultanina it is different. Owing to the peculiarity of the fruiting habit of this variety, as we have seen already, we need some kind of a support to dispose of the fruit canes. In older vineyards we find that each grape vine is given a six foot, usually redwood, stake to which the bearing canes are tied in a vertical maner. Usually the vines

Something Worth Knowing

About Batteries

Inside the Still Better Willard Battery are four important things, *hard rubber jars; plates; battery solution,* and *Threaded Rubber Insulation.* Each *cell* consists of a jar with plates, solution and insulation sealed up inside of it.

The hard rubber jar *insulates* each cell from the other cells in the battery.

The Solution is a mixture of sulphuric acid and water. The acid does not have to be renewed, but you have to renew the water by adding a little every two weeks or so, to keep the level above the tops of the plates and to take care of the evaporation.

The Plates are of two kinds, positive and negative. Chemical action between them and the Solution makes the electric current which operates starter, and lights, and furnishes the spark.

The Insulation between positive and negative plates is the all important item. Ordinary insulation almost always wears out before any other part of the battery. Threaded Rubber Insulation lasts as long as the plates and does not have to be renewed. That is why it has been termed one of the greatest of the many remarkable battery improvements of the Willard organization. Ask the nearest Willard Service Station to tell you more about it.

TOP DRESSING TALKS, No. 12

100% Increase in Orange Crop

Mr. R. L. Wells, Rialto, San Bernardino County, Cal., applied Arcadian Sulphate of Ammonia to a portion of his orange grove. The rate of application was 4 pounds per tree in two installments of 2 pounds each. The material was scattered in the basin March 1st and April 1st, each time just previous to an irrigation. This was in 1917, but due to hot winds there was no crop that year.

In 1918 the trees receiving Arcadian Sulphate of Ammonia produced at the rate of 648 field boxes per acre, while those without Arcadian yielded only 324 field boxes per acre. Estimating the value of the oranges at $1.90 a field box, we have a gross increase of $615.00 due to the Arcadian Sulphate of Ammonia, which cost only about $28.00 per acre.

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

are arranged on the square system, say, ten by ten feet. In this case the grower is able to cross cultivate, which seems to be the only advantage. This system of training can not be recommended because only the top buds of each cane will make new growth and bear grapes. They are so interlaced when harvested that a large number of berries will fall on the ground, especially when the harvesting is done by indifferent grape pickers. In addition, all the good wood which should be used for next year's bearing canes has to be thrown away as it is on the top of the grape stake. Due to the fact that the center of the grape vine has been more or less shaded the few wood spurs which may have been left have made very little or no growth and the pruner is very much up against it in finding enough good canes for the production of a full crop of grapes for the next year. The best way of disposing of the cane is on a trellis. The vines should have been planted in avenues, that is to say, 6 by 12 feet, 7 by 14 feet, etc., the distances depending upon soil conditions. If possible, the avenues should run from east to west. This will facilitate the making of raisins in the vineyard. In a large number of plantings, a six foot stake is used for every grapevine and the stake is driven as closely to the vine as conditions will permit. This interferes very much with pruning. On each end of the row there should be a strong post. Seven foot split fence posts which are 4 by 4 inches on the small end have given good results. If the vines are six feet apart in the row, one 2 by 2 inch six foot split grape stake, at intervals of 24 feet, will be plenty, provided No. 11 galvanized iron wire is used. Very often growers will take No. 14 wire or even No. 16, but nothing is gained by doing so. The grape stake in the row should be half way between the vines. Two wires should be used, the lower for the bearing canes which are tied in a more or less horizontal fashion, and the upper is there principally for the attachment and support of the young shoots, to protect them from being broken off by the wind. The tying of the bearing canes into a horizontal position increases fruitfulness. The center of the vine is open, the young shoots in the center of the vine have plenty of air and sun, and the pruner will have no trouble in finding the required number and length of bearing canes for next year.

Time of Pruning

Grape vines can be pruned after the leaves have fallen off in the fall, till about two or three weeks before the buds start to swell. Experiments as to the best time of pruning were carried out at the university farm several years ago, and it was found that the grape vines pruned during the months of February and March gave the best results. Unfortunately, from a practical point of view it is not possible to prune all the grape vines in California at this time of the year. In large vineyards pruning has to start earlier in order to get the work done before the buds start to swell. In a location which is much subject to spring frosts a system of double pruning has been made use of. During winter the grape vines are pruned, all canes which cannot be used for spurs are cut off, and if the grape vines are Muscats, the canes are left 10 to 12 inches long. The upper buds on the canes thus left start to grow first, and in case the frost should destroy these, the lower buds which remained dormant can be used. If there should be no frost, and when the danger of late spring frost is passed, it is necessary to go over the vineyard again and prune the spurs down to the proper number of buds.

Pruning Implements

In vineyards where the grape vines are reduced to a low stump, the long handled pruning shear for practical reasons may be the proper tool to use. But where the grape vine has been trained up to about 20 inches above the surface of the ground I very much doubt whether it is the proper shear to use, especially when it is a question of pruning trellised vines. One can always tell by entering the vineyard where long handled shears are used.

In vineyards which are 15 or 20 years old it often happens that one has to remove portions of the vine which are two or more inches in diameter. There is no pruning shear on the market which will permit the pruner to do that satisfactorily. The proper way is to use a short sharp pruning saw, which should be pointed and will permit him to cut very close without doing injury to the remaining portions of the plant. If the vines have been trained in the proper way, all the pruning can be done with a small shear, which should always be sharp, and a short saw.

DEHYDRATING PLANT INSTALLED

A demonstration of the working of a thoroughly modern dehydrating plant was made at Van Nuys, Los Angeles County, a few days ago and called for favorable comment from experts of the department of agriculture and others. Amongst those who were present were: D. F. Nichols, of the U. S. D. A.; Prof. A. W. Christie, of the dehydrating department of the University of California; D. B. Mackie, state entomologist; E. C. Clemens Horst, of San Francisco, a pioneer in the dehyrating industry in California; Franklin Nutting, of Fresno, an official of the American Seedless Raisin Co.; F. E. Barrett, a large grape grower of Healdsburg; Mr. Sullivan, of the San Joaquin Valley, largely interested in the fruit industry, and many others.

This plant is the fifth of its kind to be installed in Southern California and is in the plant of the Beales-Kimball Co. The manufacturer's agents conducted operations, and cold storage grapes were made into raisins and sweet potatoes into flour before the eyes of the observers. The potatoes were thoroughly washed, the skin removed, sliced, or rather cut into small pieces, and placed on wire trays. They first went to the blancher filled with live steam. The blanching process required five minutes. From the blancher the trays were placed in the dehydrator where the excess water was removed but in such a way that the original quality of the product was preserved. After about five hours in the dehydrator the sweet potatoes were ground into a fine flour. This is of value in the baking of pastries and is in high demand. This flour is so rich in sugar that little or no sweetening is required. The plant has a capacity of from eight to ten tons every 24 hours and the first work will be with about 150 tons of sweet potatoes. Carrots, onions and other products will follow.

THE MOST BEAUTIFUL CAR IN AMERICA

The Ideal Five-Passenger Car

It required only thirty days for our new five-passenger "Glenbrook" to establish itself as one of the most popular cars on the American market.

Now, its reputation has become International and the demand from Great Britain alone is far in excess of our export allotment.

The "Glenbrook" is a tremendous success—there can be no doubt about that. It has won its way into the hearts and minds of the Motoring World almost over night.

It has made more real friends, in a shorter space of time, than any other model ever produced by this Company. If you are at all familiar with Paige history, you will appreciate the significance of this statement.

There is, of course, a very definite reason for such universal endorsement of our new car. You will find it in the single word, *Performance*, as expressed through a strictly modern power plant and chassis.

The "Glenbrook" is not a racing car though it is easily capable of sixty miles per hour. What is vastly more important, it is an utterly dependable car—one of the most thoroughly *satisfactory* motor vehicles that has ever been developed for the road.

By "Satisfactory," we mean that it possesses all the power and speed that a sane man could possibly desire. We mean that it offers the true luxuries of exquisite design, ample room, soft upholstering and velvety spring suspension—all these without the burden of excessive upkeep.

It is, in a phrase, the Ideal five-passenger motor car—an incomparable investment in six-cylinder transportation. The logical recognition of this fact has resulted in a permanent demand that is World Wide.

We predict that you are going to hear the "Glenbrook" referred to as the greatest dollar-for-dollar value on the American market. It possesses such obvious advantages over the usual type of five-passenger car that this conclusion would seem to be inevitable.

However, you alone must be the judge of comparative values. We merely ask you to take one ride in the "Glenbrook" and form your own opinion. On this basis we are content to rest our case because we know that our three years of experimental work and testing have, indeed, produced the finest of all light sixes.

20 Years Experience

In this Direct Connected

Motor Driven Pump

It's a pumping outfit that's built to save you trouble and delays—to deliver a large head of water with minimum expense.

Skill and experience developed through 20 years have been applied in design and construction.

So the "Bean" Universal is today the leading pumping outfit of this type.

Distance to water below surface of ground.....
Probable distance to water when pumping.....
If water is to be raised above surface of ground, how high? (Length and size of pipe line).....
Volume of water desired (Gals. per min.).....
(Inches) .....
If you have pit, give width..... length.....
depth.....
H. P. of motor or engine if you have that equipment.....
Give total depth of well.....
Inside diameter of well.....
Is well straight and true?.....
Is electric power available?.....
Name .....
Address.....
Rural Route No.....
521 Box.....

Needed Features

You need all the "Bean" features in your pump to insure pumping satisfaction.

—A generous water seal that entirely surrounds the shaft where it enters the case, avoiding loss of priming. No need to cinch packing so tigbtly that it cuts the shaft.

—Automatic water balance greatly reducing friction.

—Oversize outboard pulley, eliminating vibration.

Both suction and discharge adjustable at any angle.

Other advantages, too numerous to mention here, make this the ideal pump.

"Bean" Universal

Direct Connected Motor Driven Pump

DRIED FRUIT INSECTS

(Continued from Page 278.)

The Sawtoothed Grain Beetle

Of somewhat lesser importance than the dried fruit beetle, the sawtoothed grain beetle, Silvanus surinamensis Linn., is nevertheless exceedingly damaging at times. The larvae are minute whitish wormlike individuals about one-fourth of an inch long, while the adults are brown or blackish beetles one-fourth inch long, slender and with saw-like teeth along the sides of the prothorax or neck, which cannot be seen without the aid of a hand lens or magnifying glass. They work generally in dried fruit and are specially injurious to figs, not only destroying much of the insides but boring tiny holes throughout the packages.

Control Measures

Probably the most important single factor in the control of these dried insects is cleanliness, although where carefully followed it may be necessary to resort to other measures as well. With the exception of the dried fruit beetle, which may be brought in from the drying yards, the source of infestation where there is any is usually in the packing house, if at the point of origin, or in some of the storehouses after it is packed. A fundamental practice is to thoroughly clean up the packing houses prior to harvest time. Fruit which has been held over from previous seasons should be carefully inspected and, if found infested, should be thoroughly treated to kill all living insects. In which case also the entire house will require a cleaning and fumigation to kill wanderers which may be hiding in cracks and crevices all through the plant. This is the only way to rid of this source of infestation which is a constant menace to the new crop.

Fumigation

Fumigation for a general cleanup of a warehouse or for small lots of infested fruit may be employed with good results. In this method it is necessary to have a comparatively tight receptacle or room so that a considerable expense must be incurred to prepare the average packing house or warehouse so as to make sufficiently tight to get a proper concentration of gas to secure killing results. This may be built in a convenient place in the packing house and used for many purposes. It will insure quick and efficient work at a minimum cost of materials.

In the absence of such a room a tight heavy canvass may be thrown over piles of fruit in bins or boxes and treated successfully.

Carbon Bisulphide

This gas is a heavy vapor given off in evaporating the liquid of that name. For general purposes in either large or small spaces it should be used at the rate of 20 pounds per 1,000 cubic feet of air space. In handling this material it must be remembered that the gas is heavier than air and will settle to the bottom of a room or house. This is a great advantage in the cases of heavy dense masses like raisins and bins and boxes of fruit, for if placed in shallow containers upon the top it will gradually work its way through to the bottom. Where the liquid containers cannot be placed directly upon the fruit or where employed in a large house they may be placed on boxes, step ladders and other things to raise them as far above the floor as possible. The liquid is highly inflammable and the gas is explosive when mixed with air, so that great care should be taken in keeping lights away from the building when it is being used as a fumigant. Where fire insurance is involved it is advisable to take the matter of fumigating with this gas up with the fire underwriters to ascertain their rules governing its uses.

Hydrocyanic Acid Gas

In the past this gas has usually been obtained by a pot-generating method, which is still extensively used for such purposes as we are discussing. To treat 100 cubic feet of air space it will require the following:

Sodium cyanide (129-130 per cent), one ounce; sulphuric acid (commercial), one fluid ounce; water, two fluid ounces.

The method of handling is as follows: Secure earthenware pots or generators of from two to three gallons capacity, or smaller if needed. Place in proper positions, add the commercial sulphuric acid and then the water. After weighing out the cyanide place it in small thin paper bags, drop these in the generators and leave the room quickly, closing door. It will of course be necessary to determine the cubical contents of the space to be fumigated and to use the above formula for every 100 cubic feet. If more than 16 ounces of cyanide are required use two generators, as that amount is sufficient for one. The paper bags allow time for the operator to leave the room before the reaction becomes violent and add to the safety of operation. The rooms should be made tight, so that the operators will have nothing to do but get away when the cyanide is added. It is well to remember that the gas is very deadly and great care must be taken in using it. The rooms treated should remain closed for at least one hour, or two if possible. It is a common practice to administer the dosage at night and to leave all tight until morning. Then the doors and windows may be opened from the outside and under no circumstances must anyone be allowed to enter until the gas has been allowed to dissipate.

Hydrocyanic acid gas may also be obtained in liquid form and administered directly to the fumigation room or tent by means of a special apparatus for the purpose. Unless desired in large quantities this material is not to be recommended. It should only be handled by one who is thoroughly familiar with it and the apparatus, for it is even more dangerous to human life than that generated by the pot method.

Vacuum Fumigation

Considerable experimentation has been done in recent years by the federal and state authorities with a vacuum fumigator constructed of steel plate and used as a fumigating room from which the air has been drawn and vacuum conditions created. Into this the fumigants are drawn through the materials placed inside for treatment and splendid results have been obtained. The advantages of such an apparatus include thorough penetration of the gas into the densest materials, quickness of killing and operation and ease and safety in handling. Carbon bisulphide, hydrocyanic acid gas and dry steam may be used.

Heat

The use of heat in the treatment of insects in mills, packing houses, warehouses, etc., has come into general use in many parts of the country chiefly in connection with the manufacture of cereal food products. The places are equipped to enable the maintenance of a minimum temperature of from 140 to 180 degrees Fahrenheit for several hours, which is sufficient to kill the young and adults as well as many, or in most cases all, of the eggs. Repeated treatments insure complete eradication.

Clean fruit in sealed insect-proof packages will reach the ultimate consumer in a pure, wholesome condition.

EVAPORATION-DEHYDRATION

DRYING, dehydrating and evaporating California fruits under California conditions was given a most thorough discussion at the recent San Jose meeting. The meeting did not end, however, in perfect agreement as to best of methods under all conditions. California sun drying has been so effective and so thoroughly economical that methods reported by Northwestern fruit growers did not appeal very strongly because of the large expense involved in preparation. Practically all drying or evaporating is done in Washington and Oregon artificially. On this point Prof. Cruess remarked:

"It remains to be seen whether this method of artificial drying will replace the ordinary sun drying in the orchards of California, as has been the case in many of the Eastern states. Its use has, within the past two or three years, proceeded so rapidly that a very close study of the subject is warranted by California growers."

Prof. Cruess spoke of the various types of evaporators, including those which operate with natural draft, with forced draft and on the distillation principle. Stack and kiln systems

(Continued on Page 292.)

KEEPING THE "MOVE" IN YOUR MOTOR

(Continued from Page 281.)

and jolts. A small quantity of it will serve for a long time.

If a grease gun is not included in the tool kit of the car one should be purchased to handle the heavier lubricants without waste and soiling of clothes and hands. A gun provided with an extension nozzle of curved shape will prove handy in reaching the more inaccessible parts of the mechanism.

Regularity is the secret of success in keeping one's car at work continuously and finding it ready to go in all weather. Every reader of The Cultivator has some friend who seems to have "good luck" with his car and has a powerful, easy running and easy riding machine every day in the year. There is no such thing as luck in motoring. The fellow who is getting gratifying results has made systematic lubrication a part of his ritual. He gives his machine the same daily attention that his horse formerly demanded and counts lubrication as important for the car as regular feeding was for the animal.

If there is an oil feed or oil pressure gauge on your dash cultivate the habit of glancing at it occasionally, at least once in every mile or two. Never take the car out of the garage without testing the level of oil in the crank case to make sure that your supply is adequate. When going on long trips carry a gallon or half gallon can of oil under the seat for use in an emergency. Oil is cheaper than repairs or replacements.

Care of the electrical system and of the tires is important but falls in line secondary to lubrication. Usually the instruction book gives complete information concerning tires while the various battery makers include pamphlets describing their product and its proper use.

There is no excuse for letting tire pressure fall below the number of pounds specified. Air is cheaper than anything under the sun. It is one necessity that the profiteers have not managed to corner.

An article of this nature would not be complete without a word of caution regarding the menace of vibration. The slogan "Vibration is Life" should be changed to "Vibration is Death" with reference to the motor car. A new machine will inevitably loosen up and work apart at the points where there are bolts, nuts and screws. To "get out and get under" has become one of the traditional jokes of motoring, but the practice pays.

File a requisition on the women folks for a discarded remnant of carpet or something of the sort and spend a half hour each week in an undignified recumbent attitude under your gasoline chariot. Take two or three sizes of wrenches with you when you go underneath and a great deal of annoying crawling out to get the proper tool will be avoided.

When your car is tight and fit all over, properly greased and lubricated, the water and gas tanks full and the tires at specified pressure you have the world before you and leave grief and exasperation behind.

MARKETING IN TEHAMA

The Tehama County farm bureau has started a market department in operation. This department began work on January 17 and made the first cooperative shipment of hogs on January 21.

This shipment consisting of 87 head was sold to the Western Meat Company. The price for the entire lot was $13.45 per hundred at shipping point. Fifty-seven head of this carload graded out as topper hogs and brought prices of $13.85 at shipping point. These prices ran from 50 to 75 cents higher per hundred than any local buyer had been offering, and in fact until the farm bureau came into the field the local buyers here were not offering within $1.50 per hundred of the prices obtained.

This department is also handling mill feeds and seeds on a strictly cash basis. It is planned to make hog shipments out of the county every two weeks and when possible every week.

One interesting feature of this market department is the Market Bulletin occasionally sent out.

The Choice of Men Who Know

AJAX TIRES, in farm service, have always performed with that same complete satisfaction which marks their use on city streets.

The man whose automobile must take roads as they come, can count on Ajax Tires.

Ajax Racing Triumphs

Ajax Road King, with its burly tread braced and reinforced by Ajax Shoulders of Strength, stands first in favor with those daring speed kings who race on dirt tracks. At state and county fairs in 1919 Ajax Tires fairly swept the field. They outstripped competition. They stood up under gruelling tests—and won.

These Ajax achievements are full of meaning to the farmer—for, after all, dirt tracks are merely country roads fenced in.

Your best dealer can supply you with Ajax Tires—Ajax Road King, and Ajax Cord with the Cleated Tread, Ajax Inner Tubes and Ajax H. Q. (High Quality) Tire Accessories.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

ORDER SACKS EARLY

Grain growers and others having use for jute sacks during the coming season should heed the warning of Warden J. A. Johnston in effect that orders should be placed at once to make certain of securing quantities desired and the present especially low price. Orders prior to April 1 for 10,000 or under may be filled at the price of 15 cents. Order blanks may be secured by writing the warden.

ROBINS

The other day the robins came—not one or two with their chirp to remind one of barefoot days when they spent the whole summer with us, but hundreds, literally thousands, of them all over the lawn and in the trees. At one time there were 18 robins in or around one little bird-bath less than three feet in diameter. They all had on their red vests and gave such a concert that even the mocking birds were discouraged. Apparently they were on their way to their summer resorts in the north and their stay was all too short, for in a few hours they were gone and we are now waiting for the next reminder of the old swimming hole days.

Give the birds a bath. A double handful of cement and a small bucket of sand coating over the dirt around a hydrant and basined so as to hold water an inch or an inch and a half deep suits robins to a T.

FEDERAL ROAD AID

Secretary Meredith of the U. S. D. A. is calling atention to one need of the West in the matter of good roads and to the handicap from which the West suffers because of millions of acres of land being held in federal reserves. This throws a vastly greater proportionate cost for road construction on the privately owned land. The secretary said:

"I think we must recognize the fact that the existence of these large areas of government lands places these states in a somewhat different situation from the remainder of the country, and that it would be only equitable for the federal government to increase its percentage of cooperation over the present basis. I am also heartily in favor of continuing the appropriations for the building of national forest roads. These forests constitute a great natural resource and their preservation and development is a national responsibility which ought to be met in full measure."

QUARANTINE ORDER 37

It is reported that the Garden Club of America is against Federal Quarantine No. 37. Federal Quarantine No. 37 is becoming famous because of its value in preventing entrance of various and diversified insect and fungus pests. Incidentally it has also prevented the entrance of some most useful and beautiful floral novelties which have been raised in sections from which the department of agriculture feels it entirely unsafe to admit plants. Supposedly the members of the Garden Club are largely of the wealthy class and unfortunately the class which resents any step which prevents immediate enjoyment. But certainly, such an organization should consider the welfare of the plant industry of the nation rather than their own immediate pleasure. A former Californian, now in Chicago, John P. Bramhall, has written our state department of agriculture suggesting a counter-campaign of education which shall show clearly the great advantages gained by the quarantine compared with the trifling inconvenience. If these sympathizers of the Garden Clubs are made to understand that their favorites of the garden are threatened with far greater dangers from insect and fungus pests from abroad than from Quarantine No. 37, they may change their minds.

California is responsible more than any other state for making possible this quarantine regulation, and this state will support that measure to its utmost.

LONG QUESTIONS

There are some long questions before the new secretary of agriculture. Discussing the matter, a letter sent out by the National Board of Farm Organizations extends greetings to the new secretary and calls attention to the difficult and serious problems of the present day. The food problems have been handled far from satisfactorily to the farmers. Consumers prices have been exorbitant, and very often prices to producers have been insufficient to cover cost. Still worse, in order to divert attention middlemen have set up the cry: "The farmers are to blame." According to recent investigation this is causing not only discouragement but determination to slow up on production. This is the last thing that the farmer should do for the world needs food, and it is to be hoped that before another marketing season some definite measures will be adopted which will enable the producer to secure justice. Regarding the new secretary's job the Board says:

"The agricultural outlook of the nation at present is not necessarily dark, but there are fundamental questions evident to everyone who seriously considers the matter, upon which the future prosperity of the farmers of America depends. With these facts in mind it is certain that at no time since the creation of the department of agriculture was it so essential that a man thoroughly informed as to the needs of the farmer should be entrusted with the administration of its affairs. It is fully realized that the new secretary is handicapped by the fact that he enters upon his duties late in the history of the administration and at a time when many of his acts will be judged from the political standpoint. The time left for the creation of a new administrative policy is short, but Mr. Meredith can still justify the confidence placed in him by the president in this appointment and do much in a constructi e way for the benefit of agriculture, at present uncertain and hesitating."

LIVE FARM BUREAU

The Glenn County farm bureau is one of the live and up-to-date farm organizations of California; up-to-date, because it is giving efficient service. One feature of thi service is the issuing of a weekly market bulletin. This is issued from headquarters at Willows. There is a branch office and warehouse at Orland.

The bureau does but little with direct buying and selling; it simply acts as a clearing house and through public auction and otherwise gives opportunity to dispose of farm livestock, all kinds of crops, and even the old phonograph, cultivator, harrow, dash churn or other unused implement or article. The aim of the market department is to unite the farmers in an organized effort to bargain collectively in selling their products and in buying whatever they need, at reasonable prices.

SPINELESS CACTUS

In the livestock department of this issue Prof. Thornber of the University of Arizona makes short reference to spineless cactus as a livestock feed. It closes with "My recommendation is that you will grow more forage and better forage on cultivated land if you will grow alfalfa or sudan grass, and that for mesa soils you will grow a great deal more forage by using Rhodes grass."

Which induces us to look back in the files of the Cultivator of some six and eight years ago. Spineless cactus planting was then in good form, but the Cultivator investigated, secured from Professor Jaffa analyses which showed its low feeding value, and at the same time wrote to Prof. Thornber, who confirmed in our issue of February 19, 1914, our fear that the friends of cactus as a cattle feed were rather too optimistic. In the same issue one writer said: "It is not a complete feed on account of its high content of water and low percentage of protein."

Many continued the planting, and where this was done with proper understanding of its real place it has possibly proved profitable.

One of the greatest needs of the Pacific Coast is good pasturage or forage plants, but unfortunately cactus does not answer our requirements, at least not in a large way.

If you cannot use this adv., please clip and hand to friend or neighbor.

WANTED

A Harmonious Euphonious, Utilitarian Name

For a California Mesa Overlooking the Ocean and a

Brand New Harbor

Now Being Dredged on the Line of the Four-Million Dollar

NEW COAST HIGHWAY

Now Building to Connect all Beach Resorts from Santa Barbara to San Diego

The Newport Heights Cooperative Association, Fairview Farms Association and Newport Mesa Association together offer

A PRIZE of $25.00

for the most appropriate name suggested as a substitute for Harper, the present postoffice name of the apple and lemon growing communities "in sight of the harbor, in sound of the surf" on the Newport tableland in Orange County, Southern California.

The following data may guide contestants in selecting a prize-winning name—

Community center 1½ miles from ocean; 2 miles from Newport Bay and Beach where over three-quarters of a million dollars are being invested by city and county for harbor development, industrial district, etc., and where following new enterprises are locating—Fish cannery, fish preservative plant, wholesale fish market, fishermen's supply house, fish fertilizer factory, ice and cold storage plant, glass factory, etc.; 3 miles from Balboa Beach, with its surf and still water bathing and inland water playground for canoeing, rowing, sailing, yachting and motor boat racing; 4 miles from the Palisades and caves, coves and filagree rocks of Corona del Mar, opposite the Balboa sandspit; 5 miles from Huntington Beach, a comfortable home and garden community with fine schools, well-paved streets brodered with acacia and Monterey pine, long cement pier, open air plunge and home of the annual Orange County Fair; 9 miles from Santa Ana, county seat and center of one of the richest and most intensively cultivated orange, lemon and walnut growing sections in the state; 20 miles from Long Beach; 40 miles from Los Angeles; an hour's ride or so to the streams and camping grounds of the canyon fairylands along the southwest slopes of the Santa Ana mountains. West of the Newport tableland mistily loom the graceful outlines of Catalina Island, on the north the Sierra Madres form the sky line, and to the northwest the Palos Verdes hills at San Pedro and the Santa Monica mountains are visible. The large and highly flavored apples grown on the Newport Mesa or tableland have received first awards at leading Southern California fairs and land shows the past two years, and both apple and lemon growers in this section are increasing their acreage. The finest peaches, pears, plums, persimmons and other fruits are grown, while vegetable gardens and egg farms play an important role.

CONTESTANTS should be sure to date letters and write address plainly. Mail suggested name to Mrs. F. B. Spencer, Harper, Orange Co., Calif.

For illustrated folders more fully describing this section address: For Newport Mesa, W. S. Williamson, Harper, Orange Co., Calif. For Newport Heights, Ed. Logsdon, Harper, Orange Co., Calif. For Fairview Farms, Bryan and Bradford, 856 S. Hill St., Los Angeles, Calif. For Balboa Beach, W. L. Jordan, Sec.-Treas. Balboa Beach Chamber of Commerce. For map of Newport Bay and industrial sites, W. W. Wilson, Sec. Newport Beach Chamber of Commerce. For Huntington Beach, E. E. French, President Huntington Beach Chamber of Commerce. For Orange County in General, J. C. Metzgar, Sec. Santa Ana Chamber of Commer .

The Tenth National Orange Show

By James De Camp

COMPARED to Old Baldy, Catalina and a few other of our original natives the orange is a mere newcomer in California, the first of his ilk having stepped off the "tourist special" a bare hundred and fifty years ago.

The orange added an interesting variation to the "veni, vidi, vici" process of the Hon. J. Caesar. It came, it saw, and it grew, conquering thereby. That Mr. Orange, Mrs. Orange, the Orange kids, their aunts, uncles, grandparents and relatives-in-law have become thoroughly at home in the balmy reaches of California and have settled there to stay is amply attested by the Tenth National Orange Show, which defied all superstition by opening at San Bernardino on Friday, the thirteenth of February.

In point of quality and quantity of exhibits and cleverness of decorative schemes the 1920 Orange Show is said to stand unsurpassed. It is a matter of pride with the Gate City of San Bernardino that each exhibition shall surpass that of the preceding year. That this ambition has been more than realized is attested by the scores of thousands of visitors who have crowded through the entrance gates, many making a pilgrimage of several hundred miles to do homage at the court of Pomona, goddess of fruits.

Experts who have inspected the various exhibits with a critical eye state that the quality of this year's product leaves nothing to be desired. Externally the commercial pack is firm, uniform and beautiful to look upon. The manner in which the offerings of the various communities, chambers of commerce and other organizations were planned and arranged accentuated the symmetrical beauty and radiant color of the fruit, which suffused the large main tent with a restful golden glow.

One feature of the show which was always surrounded by an interested throng was the miniature packing plant operated by the Fontana district. Here all the processes of cleaning, sorting, grading, wrapping and packing were to be seen at a glance, even to the box mill which slaps an entire box together in two winks and a half.

Other novelties of unusual merit were supplied by the Mutual Orange Distributors, the Associated Chambers of Commerce of the San Gabriel Valley, Highland Chamber of Commerce, Imperial County, Orange County, Fresno, Colton and the Pacific Electric.

The entire Orange Show and the mighty citrus industry of which it is symbolical stands a monument to the power of cooperation. It is safe to say that no other line of endeavor has been so thoroughly organized on a cooperative basis as the citrus industry in California. Instead of jumping at each other's throats in competition, as is too often the case in many lines of business, the California citrus growers have put their heads and resources together to advertise, pack and market their fruit collectively with the minimum of overhead expense.

Their united efforts, while reflecting to their own benefit, have performed a service of inestimable value to the Golden State. It is said that one organization alone has expended two and a half million dollars in advertising California citrus products throughout the world, developing such a tremendous volume of business that the cost of this exploitation amounts to but one-fifth of a cent per dozen. The state is no longer famous for its climate but is spoken of in each corner store and at every family table as the native heath of the orange.

Worthy of special notice at the Orange Show were the several extensive and tantalizing exhibits of by-products from citrus fruits. The science of creating delectable jams, jellies, marmalades, candies and oils as well as vinegars, acids and even toothpaste and washing powder from culls and peelings has been one of the latest commercial developments of the industry. Progress along these lines is utilizing many thousands of tons of fruit which, while unsuitable for shipment, was perfect in every other particular but must be sacrificed or dumped for lack of a market.

The following organizations were responsible for the 17 feature entries of the Tenth National Orange Show and for pack fruit displays of distinction: Mutual Orange Distributors, Redlands; Redlands Chamber of Commerce of Commerce; Elephant Orchards, Redlands; James Mills Orchards, Hamilton City; Etiwanda Board of Trade, Corona; Riverside; Highland, Upland, Whittier, Ontario, Azusa-Covina-Glendora Fruit Exchange, Hemet Orange Growers Association, Fresno, Orange County, American Fruit Growers Association, Associated Chambers of Commerce of the San Gabriel Valley, Pasadena Chamber of Commerce, Pasadena Board of Trade, Fontana Company, Rialto, Colton, California Fruit Growers Exchange, Hemet Orange Growers Association and the Imperial Valley.

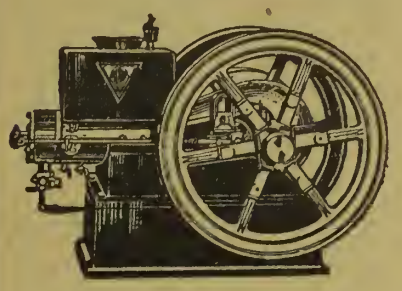
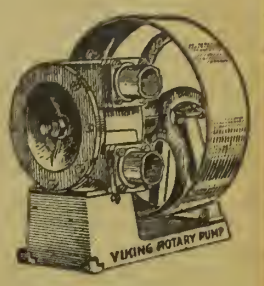
NEED WATER?

Alpha Engines afford an abundance of reliable power — Viking Pumps handle up to 1050 gallons ery per minute.





Alpha Engines

Viking Pumps

THE MOST EFFICIENT combination of pumping equipment for the rapid delivery of water for irrigation

REASONS WHY

ALPHA ENGINES are equipped to operate on Gasoline, Kerosene, or other low grade fuels. Their design insures full power on the least fuel consumption. Their superior construction is a guarantee of uninterrupted service, low upkeep cost and freedom from breakdowns. No worry or bother with an Alpha Engine. Equipped with a genuine magneto—rotary type.

Make-and-break ignition (best for all fuels on engines of this type). Starts on magneto without cranking.

1¾ to 18 H. P.

VIKING PUMPS being of the rotary type, have twice the efficiency of the ordinary irrigation pump and maintain their efficiency under varying heads due to their powerful suction, positive delivery and slow speed. No loss of power through churning in casing. Result: Requires a smaller engine—consumes less power and fuel than other pumps of equal capacity. The Viking is Self-priming—pumps air as well as water—durable and easy to install.

Sizes 10 to 1050 gals. per min.

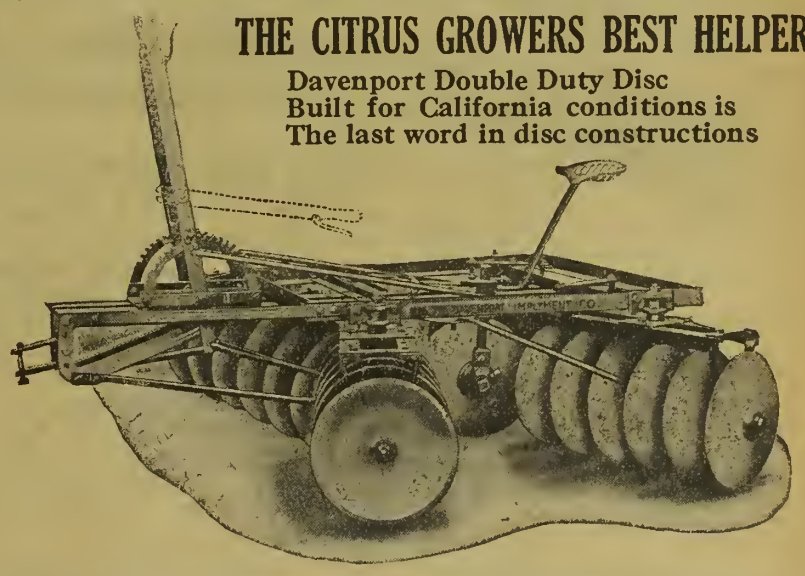
Davenport Double Duty Disc
Built for California conditions is
The last word in disc constructions



Be sure to see the Davenport Double Duty Disc. It is built to deliver service under all conditions for every pound of weight and pull applied with NOTHING TO GET OUT OF ORDER. After setting the drop levers the STAY SET held RIGIDLY and POSITIVELY IN PLACE. No automatic features to break, slip or get out of order. The drop lever feature allows the levers to be laid down low and the seat is detachable, permitting work under low hanging tree limbs. There is no disc made better adapted to work in citrus or other orchards. No implement you can use will conserve moisture that's in the ground like a Davenport Disc. Years of constructive effort and painstaking observations have enabled us to construct the DAVENPORT DOUBLE DUTY DISC so efficiently that it will do more work with less power and in less time than anything can buy for the same money. Made in 6, 8 and 10 ft. sizes. Other sizes made to order. A post card will bring an illustrated circular and price lists on any implement you may want.

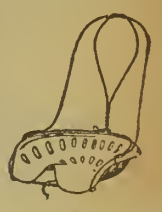
Preserve Your Strength by Attaching a NATIONAL BACK REST

To the seat of your tractor or farm machinery. It saves your back and you ride in comfort. The National Back Rest fits on nearly any seat no matter what style or shape, it can be quickly and easily attached without the use of tools. No screws or bolts. Will not slip off. Three dollars delivered. Some agency territory still open. Satisfaction guaranteed or money refunded.



CARL G. JORN
Jorn Bldg., 57 Plaza Square, Orange, California

DRIED FRUIT INSECTS

(Continued from Page 288.)

were also explained. The chief objection to the kiln system, the speaker claimed, is the method of turning the fruit over with a fork or scoop shovel. This necessitates a man walking over the fruit with resultant breakage and messing it up in an undesirable way. It was stated that a stack evaporator at Watsonville is still in use, but that this particular device has been discarded in Oregon in favor of the tunnel system. Many types are now manufactured and each claims particular advantages, but in choosing an evaporator there are other considerations in addition to the machine itself which must be studied, as, for instance, climate and atmospheric conditions. An evaporator of a certain type might do efficient work here in California where the air is usually dry during the summer, while the same system might not be adapted to Oregon, Washington or other states where rain occurs during the drying season.

Prof. Cruess warned his hearers against too rapid evaporation of fruit which takes the moisture from the surface more rapidly than from the center of the fruit, because this impairs not only the flavor but the sugar content. All fruit should be subjected to the highest temperature near the end of the process.

From Prof. Arthur W. Christie's address we quote: "For the past five years the zymology, a fruit products laboratory of the agricultural department of the University of California, has been under the direction of Professor W. V. Cruess, and investigation has been carried on as to various methods for producing dried fruits and vegetables. The experiments for a long time were on a small scale such as might be used by the housewife or small farmer. Later tests were made on a larger scale and to reach proper determinations a commercial evaporator was erected at Davis last summer. National prohibition was the immediate cause for hastening construction on this evaporator. The exportation of dried wine grapes seemed at that time likely to afford a profitable disposition of the wine grape crop. An air blast tunnel evaporator was chosen as the most promising type because that design had been proved practical by experience. This tunnel is 33 feet in length, seven feet in height and six and one-half feet in width. It is equipped with two five foot fans of the windmill type. A seven and one-half horse power electric motor furnishes the power. Theoretically the air flow is 25,000 cubic feet per minute but this volume is rarely ever maintained. The trays used are three by three feet in size with blocks at corners so that, when packed, there will be ample ventilation. The tunnel has a capacity of eight cars of 42 trays each, and an average tray load is 35 pounds.

Deductions on Experiments

"During the last grape season, grapes heretofore used for wine making were subjected to many experiments, and using these treatments as a basis, we arrived at certain deductions useful for guidance. These conclusions are substantially as follows:

"Do evaporators give a greater yield than sun drying? This query has been asked many time but I must say that even with careful experimentation we are not yet able to give a definite answer. There are apparently variations with reference to locality and weather conditions and we will have to have another season for further tests before making a proper reply.

"Are evaporated fruits superior in quality? Judging by what we have learned I think we can safely say that evaporated prunes are superior in flavor. The question of quality is largely decided by the public and not by enthusiastic producers.

"Does sulphuring affect yield? Experiments covering quite a wide range show that mild sulphuring has resulted in quite a considerable increase in yield.

"Should grapes be dipped? The dipping of grapes often gives an increased yield weight, but it is almost always small. In dipping grapes, a correct strength of lye and a carefully determined immersed exposure are important factors.

"Should exhaust air be recirculated? Tests have shown that the use of recirculated air has caused a decided decrease in fuel consumption, without increase in the time of drying.

"Can direct heat be used? We have demonstrated by tests that a direct heating system, when properly installed, caused a maximum fuel efficiency without injury to the fruit.

"Is a suction on blower fan best? If one fan is used, the suction fan is best, but on large evaporations with long tunnels both forms should be used.

"What temperature can be use safely? The evaporator can be used up to 150 degree, but I would suggest the process be commenced at a low temperature, say to 30 to 50 degrees at exhaust end, then gradually increase as required. Raisin grapes are evaporated at 150 degrees, while red wine grapes will stand as high as 190 degrees.

"What type of tray is preferable? Our experiments show that small trays, three by three feet with slat bottom are preferable."

Many questions were propounded Professor Christie and the discussions were exceptionally interesting as well as instructive.

Regarding methods used in Oregon and Washington, Prof. Warren P. Tufts gave the following:

Tunnel Drying Fundamentals

"Throughout the fruit growing sections of Oregon and Washington various designs of evaporators are in use, but the tunnel design is most commonly used. The fundamentals of this tunnel system are:

"The fruit to be dried should be started on a comparatively low temperature.

"The finishing temperature may be relatively high without in any way detracting from the quality of the product.

"It should be understood that all designs of evaporators are not equally desirable. Some have faults either in maintenance of temperature or possibly inequality in air supply. Generally speaking, however, all air intakes should be lower than the source of heat, and at least two intakes, one on each side of the furnace room, are essential to secure best results. The variation in length of tunnel may be anywhere from 16 to 50 feet.

"A six tunnel evaporator with tunnels 25 feet long will have sufficient capacity to care for the yield of a 40-acre orchard. Here in California with its dry climate that size tunnel plant would handle the crop of considerably larger acreage.

"It is said the approximate cost of drying prunes in Oregon varies from three-quarters to two and one-half cents per pound dry, the average cost being about one and one-half cents per dry pound. The length of time required for evaporation in Oregon tunnel evaporators varies from 24 to 36 hours and the temperatures vary from 90 to 130 degrees at the beginning to 160 and even 185 degrees at the finish."

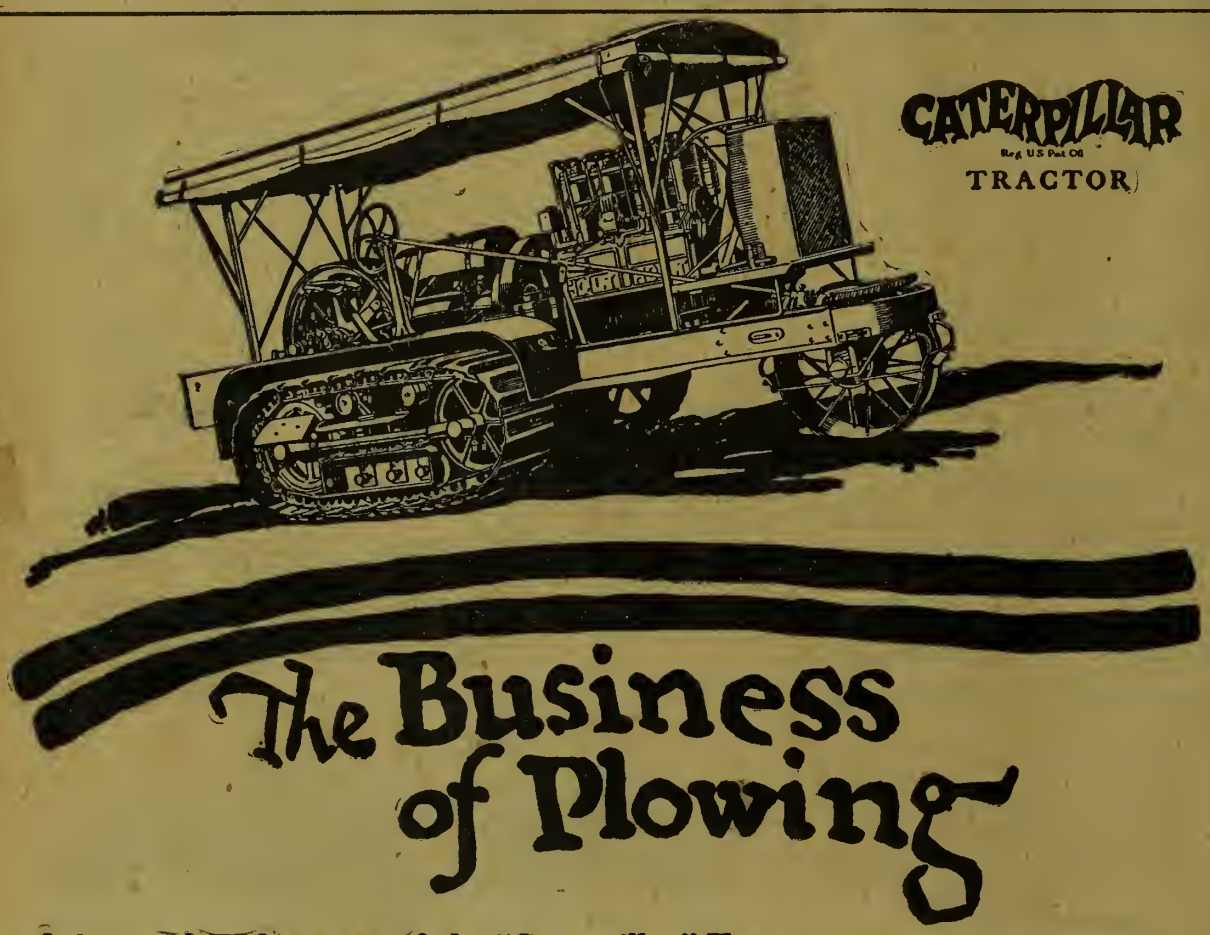
Commercial Dehydration

The activities of the United States department of agriculture with reference to dehydration were concisely explained by Paul F. Nichols, inspector in commercial dehydration in this state. In part he said:

"Sun drying and artificial drying of fruits has been carried on with a good measure of success for many years. The recent war created an unusually active and increased demand for enormous quantities, and this in turn directed attention to the necessity for dehydrated products. Congress appropriated $150,000 for the special study and betterment in this particular line of industry.

"The basic principle of dehydration is reduction of moisture to such a point that bacteria, yeasts and moulds, the chief agencies of spoilage, are unable to grow and destroy or impair the food value of the product. Of all the samples we have examined none have been absolutely sterile and only a few showed moulds and bacteria in small degree. Cooking of dehydrated products will always destroy the harmful nature of the undesirable elements."

The question as to whether fruit shall be called dehydrated, evaporated or dried was referred to a committee on nomenclature. This committee is constituted of Professor Arthur W. Christie of Berkeley, chairman; Paul F. Nicholls, Atascadero; E. M. Sheldon of San Francisco; Howard C. Rowley of San Francisco and Seward C. Simmonds of San Francisco.



The Business of Plowing

It is not alone because of the "Caterpillar" Tractor's tremendous power that it stands supreme in the farm power field, but because its power is available at lowest cost per working hour.

It is true that ability to plow deeper and to finish up a big acreage in quick time makes the "Caterpillar" Tractor a profitable investment in many cases *regardless of cost*. Yet, the fact that it plows *CHEAPER* is the advantage that gives it *universal* supremacy, in every kind and condition of work.

Because plowing is the biggest power task of the farm, it is essential to profitable farming that it be done at lowest cost. The "Caterpillar" Tractor's ability to do this, as well as to effect economies in every other power requirement of the farm, makes it the logical business investment.

MY ADVICE IS THE "75"

I have been farmiog seveo huodred acres for the last twelve years. Four years ago, I made up my miod that I had to have a tractor. I hought one—but I made a mistake. The one I bought I felt sure was big enough. It was supposed to pull a harvester easily, and it did get away with it for awhile. I used it for two years and theo I KNEW that I wanted nothing less thao the 75 horsepower "Caterpillar" Tractor. I sold the tractor I had and hougbt a "75," and under oo cooaideration would I go back to one with less power. With it I can finish up quicker and can get my plowing dooe wben the ground is right. I can pull any harvester or any sub-soiler, and I have just the right speed and power to do good work. Take it from me, if you want a tractor that's easy to take care of, that will stand up and that really has the power, get oothing but the Holt "75."

MARKETING FARM PRODUCTS

The February number of the Market Reporter of the U. S. D. A. gives an extended review of methods of marketing of farm products and especially of encouraging better marketing through publicity.

The use of publicity in marketing agricultural products is not new, but it has not been developed to a degree comparable with its use in connection with manufactured products. It is perhaps natural that manufacturers and merchants should have blazed the way and that individual growers should have been slow to organize for publicity efforts. National publicity, which embraces all forms of advertising, can be carried on only by large organizations and not by individuals.

It has been found that one essential of modern day marketing is standardization.

The need of standards for farm products did not appear until the process of marketing grew more complex and increased transportation facilities led to the development of more distant markets. Today through organizations of producers and through national and state legislation standards for farm products are being evolved and there is an increasing use of publicity for marketing these standardized farm products. The citrus growers of California and Florida, the apple producers of the Northwest, nut growers, and, to a more limited extent, potato growers, cranberry growers, grape growers and others, are organized and are selling standard products.

Although wide publicity for agricultural products will necessarily await the more complete development of standards for such products, there are other forms of publicity which tend to prevent the disastrous market conditions which arise from faulty distribution or over supplies of a product in some sections of the country. In 1918 a publicity campaign, which included the cooperation of the war time organizations and the newspapers, made possible the marketing of an enormous surplus of potatoes and prevented a waste of food; in a similar way the peach crop in 1915 and the dried bean crop in 1919 were distributed. Publicity has also been used successfully in some cities to overcome temporary gluts, and has been beneficial to the public as well as to the grower and the dealer. Recently local campaigns have been carried on in large cities to stimulate the use of milk and dairy products and to bring about a better understanding between milk producers and consumers.

AMERICAN POMOLOGICAL SOCIETY

The report of proceedings of the 35th biennial meeting of the American Pomological Society held in Boston in October of 1917 is now being mailed to members by Secretary E. R. Lake. It is a 260 page book giving complete proceedings and many illustrations of great horticultural value. Among the members of the association who had died during the preceding two years and who were given high tribute, four or one-third of the whole number, were from the Pacific Coast. They were Nathan W. Blanchard, Parker Earle, Frank W. Power, A. F. Stubenrauch.

CONCERNING THE CITROPHILUS MEALYBUG

County Horticultural Commissioner Ryan of Los Angeles County recently dispatched the following warning notice to all packing houses and inspectors in his jurisdiction.

"Danger of introducing the Citrophilus mealybug must be reduced to a minimum. To this end the transportation of fruit, picking boxes or picking crews into clean districts from orchards where this pest is known to occur should be avoided. District horticultural inspectors are instructed to insist upon rigid observance of the law.

"The present known area of infestation in San Bernardino County, as approximately defined by the federal and state departments of agriculture, lies in the Upland section from Tenth Street north to the mountains and from San Antonio Avenue to the eastern limits of Cucamonga. The only known orchard infestations in Los Angeles County are in certain portions of Altadena, Pasadena and South Pasadena.

"All fruit transported from within or near the present known areas of infestation must be regarded with suspicion and you are advised that district horticultural inspectors acting under Sec. 2322b of the Political Code will require the destruction or immediate return to point of shipment of any such fruit or orchard appliances found to be infested with Citrophilus mealybugs, or which there is reasonable cause to presume is so infested."

APPLE MEN MEET

On the afternoon of February 3, prominent apple men, brokers, growers and shippers, met with G. H. Hecke, state director of agriculture, at the St. Francis Hotel to discuss the operation of the Standard Apple Act and to ascertain what proposed changes in the enforcement of the act would be advantageous to all interested in the industry.

P. H. Murphy of Watsonville, led the discussion and J. Gardner and Geo. P. Weldon addressed the meeting. A general discussion resulted in the adoption of a motion authorizing the director of agriculture to appoint a committee representing all branches of the industry from the different apple districts in the state to consider the various problems arising and to make recommendation for their solution. The committee will meet at Watsonville at an early date, to be named by the director.

TREE WASH AGAINST RABBITS

The following formula is suggested by D. A. Gilchrist, U. S. biological survey, as an effective tree wash for protection against rabbits:

"Dissolve one ounce strychnine sulphate in three quarts of boiling water and add one-half pint of laundry starch, previously dissolved in one pint of cold water. Boil this mixture until it becomes a clear paste. Add one ounce of glycerine and stir thoroughly. When sufficiently cool, apply to trunks of trees with a paint brush. Rabbits that gnaw the bark will be killed before the tree is injured."

It is probable that one-half pint of molasses may be substituted for one ounce of glycerine.

BULLETIN, REPORT OF TION

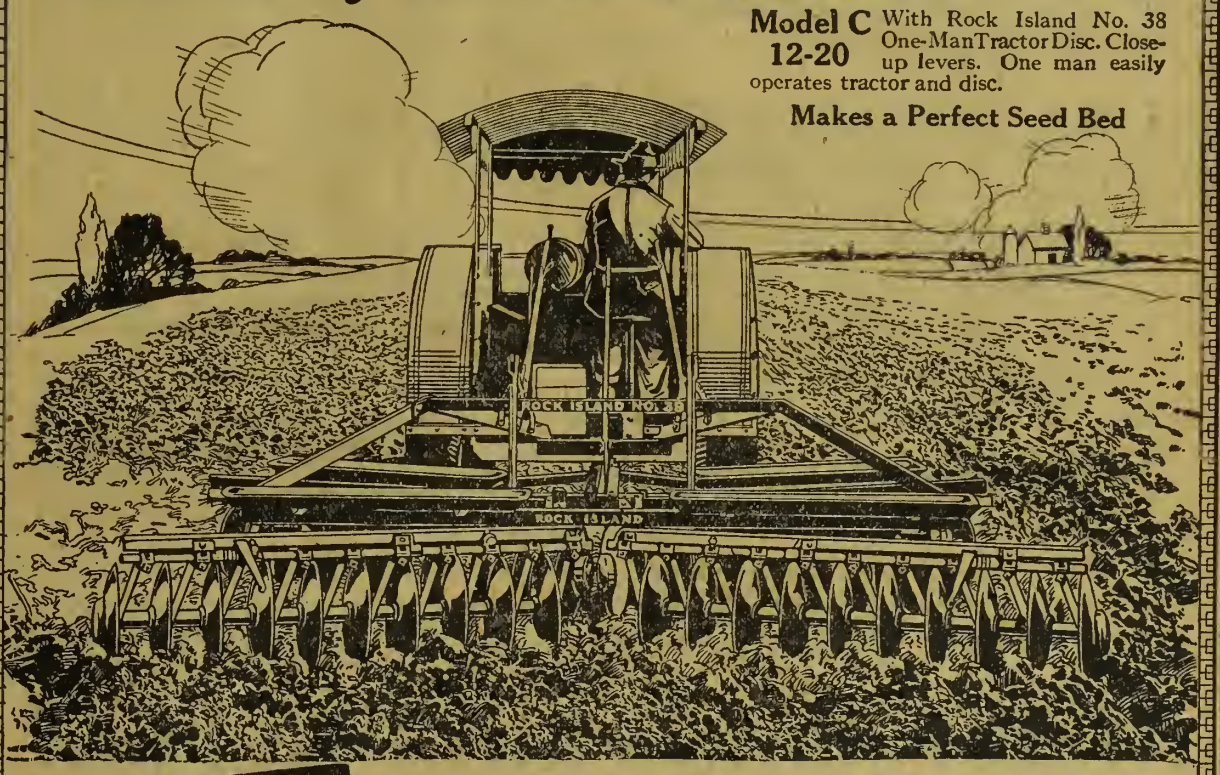
The November-December is Monthly Bulletin of the depa agriculture contains partial proceedings of the 52nd C held last November in Butt Being the last number of Vol is also contains very complete the entire volume. Many of dresses at the convention are g full. We believe this is abou quickest service yet given in printing proceedings of a state convention.

APPLY NITROGEN

This is the time of the year when an application of quick acting fertilizers proves of value. Nitrate of soda, sulphate of ammonia, dried blood, tankage and other forms containing nitrogen give almost instantaneous results. The applications may be light but repeated occasionally between now and June and the supply of moisture maintained this method of work aids in preventing the June drop which has been so serious during recent years.

Heider

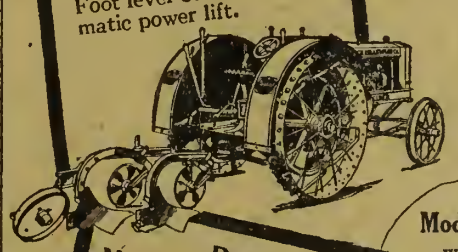
Backed by 12 Years Actual Service



Model C 12-20 With Rock Island No. 38 One-Man Tractor Disc. Close-up levers. One man easily operates tractor and disc.

Makes a Perfect Seed Bed

Model D 9-16 with No. 9 Rock Island CTX two-bottom Power Lift Plow directly attached. Foot lever control. Automatic power lift.



What other tractor gives you the *guarantee* of service that the Heider gives you—12 years use in every kind of work on farms all over America. Heider success is due to its performance—year after year—in every soil—on every power job. Let the Heider owners tell you. You don't have to take a "demonstration" as your assurance.

No Gears to Strip

Heider Friction Drive is the simplest and most dependable drive known. Does away with clutch, transmission gears and bevel gears. **15% to 20% fewer parts.** Write for Catalog of Heider Tractors and Rock Island Tractor Tools.

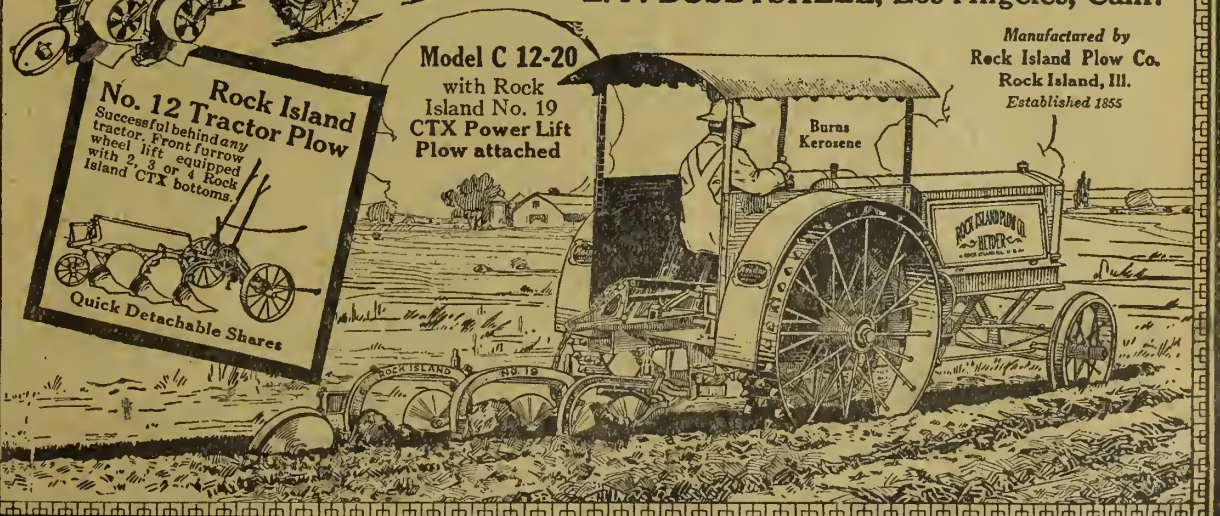
E. P. BOSBYSHELL, Los Angeles, Calif.

Rock Island No. 12 Tractor Plow

Successful behind *any* tractor. Front furrow wheel lift equipped with 2, 3 or 4 Rock Island CTX bottoms.

Quick Detachable Shares

Model C 12-20 with Rock Island No. 19 CTX Power Lift Plow attached



Manufactured by
Rock Island Plow Co.
Rock Island, Ill.

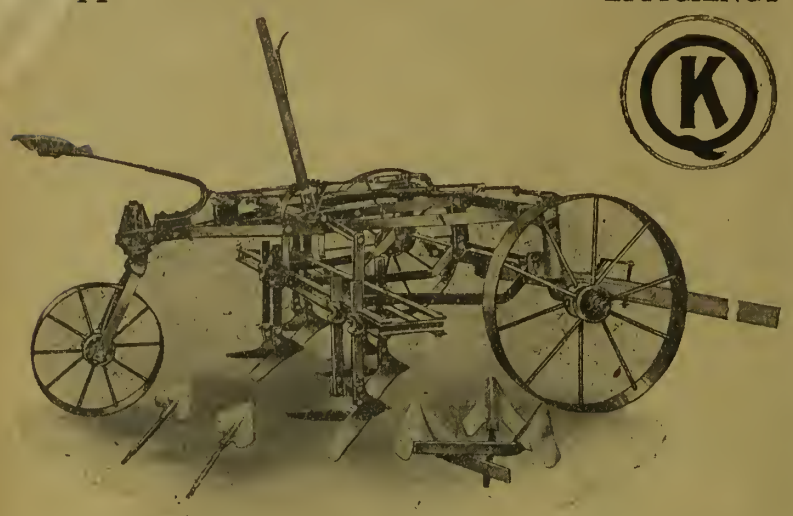
KILLEFER
EFFICIENCY



Make Your Plans Early For The Coming Beet Season

The consensus of opinion as expressed by the dealers and manufacturers on the Pacific Coast is, that you should anticipate your needs at least six months in advance, owing to the shortage of steel products.

Placing your orders early for what you may need, will save vexatious delay.

The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequence the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end which connects with the lifting rod allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheels is adjustable with a turnbuckle for taking up wear and is very easy on the operator. A lock is provided for the rear wheel that holds it rigidly in line except on the turns. An important item for the beet grower is that the sweeps, hoe steels, chisel points and all repair parts are carried in stock. Yo do not have to wait for them to be sent from the Eastern manufacturer.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Los Angeles, Cal.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Tomatoes Not Aquatic

Please tell me if tomatoes will yield well on subirrigated soil. A hole dug six inches deep will have water in it. —G. B., Escondido.

If water stays at this level all the summer no agricultural crop could be grown. Sugar beets would come as near to cropping well as anything, but this shallowness of soil is a serious bar to a good yield of any except aquatics or bog plants.

Eucalyptus for Nevada

In reading your article in January 31 issue on resistant windbreak, I see you recommend the eucalyptus. I have often wondered if they would do well in Nevada, Las Vegas County. It blows there a good deal. What about the Eucalyptus viminalis, the kind you speak of? The winds of course are hard and warm in summer, and hard and cold in winter, but there is plenty of water. If you can tell me where I can get some young trees to set out I will be grateful.—A Reader.

Eucalyptus viminalis will withstand a temperature of 15 degrees for short time when established. In the California desert sections this tree has passed through a temperature of 15 degrees above zero without being injured. Any of the nurserymen advertising in the Cultivator should be able to supply you with young trees. It is doubtful if any eucalypt, however, will endure the Nevada cold of winter. The Arizona cypress will doubtless thrive. Both catalapa and osage orange will make good summer windbreaks but will be bare in winter.

"Black Leaf 40"

Can you give me the formula for "Black Leaf 40"? About how much liquid would ten pounds of tobacco leaves make? — Subscriber, Terra Bella.

We presume our inquirer simply wishes formula for making tobacco extract by steeping leaves or refuse tobacco. There would be no occasion for reducing to 40 per cent nicotine and then diluting again. "Black Leaf 40" is simply a trade name used by a large concern which has standardized its product and protected it by adopting the trade name "Black Leaf 40" for a tobacco extract containing 40 per cent nicotine. Ten pounds of tobacco leaves would make about 40 gallons of solution as used on aphis, etc. Steep ten pounds tobacco leaves in ten gallons water. Dilute to 30 or 40 gallons.

Ginger

Can you tell me where I can buy ginger to plant?—Subscriber, Encanto.

We know of none in the state at present, though someone doubtless has it, for many attempts have been made to grow it, but with poor success. From time to time the writer has been shown or been given plants that were claimed to be true ginger, but none of them proved to be the right one. Some of these were aromatic in all parts, the roots particularly having a strong odor of ginger. But these were sturdy, robust plants with leaves from one to four inches wide. The ginger of commerce is a slender reed-like plant with grass-like leaves never an inch wide and grows but two feet high.

We know of three attempts to grow ginger in the south end of the state, but all were failures. One attempt was at San Bernardino, the roots coming from Japan and being planted in a lath house. In spite of being kept in an atmosphere as humid as possible the plants still suffered, apparently, from a desiccative air. The late L. J. Stengel, for 50 years a commercial grower of plants, experimented with ginger at his nursery in East Los Angeles, but the plants appeared unable to properly develop, stunted, finally dwindled and the top would die down as new but weaker ones came up, the vigor growing less all the while. The third attempt was at Sawtelle, between Los Angeles and the sea and was not successful. Based upon the behavior of the plants here, coupled with the fact that they thrive in the damper climate of southern Florida, we must conclude that ginger will not thrive in California unless a very cool and damp situation in partial shade may be provided and such conditions maintained at all times.

Black Currants

Do you know of a variety of black currant that will fruit in the vicinity of Redlands and if so where can I buy them?—Subscriber, Redlands.

No black currant is known to thrive in Southern California. Eight years ago the writer planted some in as cool a spot as could be found in an open garden. Morning and evening sunshine, with shade from large distant trees through the four hottest hours of the day did not provide proper conditions and the crops amounted to nothing. The only California catalog we find listing black currants has this entry: "Lee's Prolific. One of the newer English varieties." That tells the tale; we have not the cool damp English atmosphere in which to grow them.

Value of Water

I have spring water which analyzed shows, parts per million, chlorine 65, bicarbonate 153, sulphate 329, nitrate 2, calcium 117, magnesium 35, sodium 58. Is it fit for drinking purposes?—Subscriber, Hemet.

This question was referred to Dr. R. R. Snowden and he answers:

"Regarding the water analysis from Hemet, I have only the mineral impurities to form an opinion on. So far as these are concerned the water is very good for drinking purposes and could be made better by boiling and thereby precipitating the lime. As a matter of fact the fitness of water for drinking purposes is rather to be determined by the organic impurities present and certain derivatives of such materials. These factors must be found by suitable determinations in the laboratory."

McKay Power Lift Disc Plow and Sub-Soiler

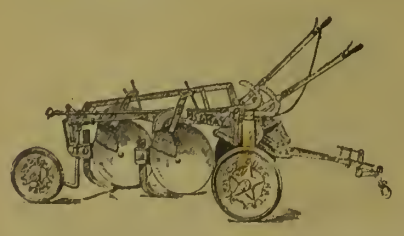
Brings Up The Soil Profits Which Lie Deep

The only Disc plow with Sub-soiler feature. Sub-soiler runs in the bottom of the furrow—breaks up the compact sub-soil, or "plow sole"—lets in more air and moisture to the young roots so they can go deeper for plant food—leaves the seed bed thoroughly pulverized and porous.

The McKay runs straight behind the Tractor. Disc is set to slice—not scoop.

Easiest operating, most durable, handiest to handle Disc Plow and Sub-soiler made.

There are NINE solid reasons why the McKay will interest modern farmers and orchardists.



If your Dealer cannot supply you send for illustrated literature and we will put you in quick touch with a Dealer in your territory.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 110 to 220 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR COMPANY
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR," Price-list and Samples.

Please state for what purpose you use the sulphur, quantity needed and date of shipment preferred.

Californian Crops Need It

CAREFUL tests show that crops give greatly increased yields when Nitrate of Soda is used.

NITRATE OF SODA

is the only form of Nitrogen that is immediately assimilated by the growing plant or tree.

Send postcard for free book, "What Nitrate has done in California."

25 Cords a Day

Easily Sawed By One Man.
Easy to move from cut to cut. Make big profits cutting wood. Cheap and easy to operate.

OTTAWA LOG SAW

Does 10 men's work at one-tenth the cost. Makes work easy. Engine can also be used for running pumps and other machinery. Saw blade easily removed. Write for our low price. Cash or Easy Payments.

30 Day Trial
10-Year Guarantee

Ottawa Mfg. Co.
2749 Wood St.
Ottawa, Kansas.

Imperial Valley shipped more of lettuce this year than last by 257 cars.

Clearing Moss or Lichens From Trees

What will remove green or gray fungus from orange trees?—Subscriber, Azusa.

The most common remedy is the use of lye made from wood ashes or coating the trunk of the tree with six per cent solution of blue vitrol and two per cent solution sulphuric acid. Another remedy is to spray with the regular Bordeaux mixture or wash with one per cent solution of corrosive sublimate.

Spraying Apples

We have some apple trees about seven years old, very healthy in appearance, but have very few apples on although they bloom very heavily. Want to take proper care of them so would like to know if, as some people tell us, we must spray five times every year. Also what should we spray with?—Subscriber, Anaheim.

The matter of spraying with all crops depends upon the pest to be reached. Regarding spraying for codling moth or the "worms" in the apples they are sprayed with the arsenate solution just as the trees are finishing blooming, using care to get the spray on the blossom end of each fruit. Another spraying is given some two or three weeks later and some orchardists find it necessary to continue this four or five times during early summer. Some other growers, however, have found fairly good results with only two sprayings. This depends upon your section and as to whether the moth is breeding the year through. Your county horticultural commissioner can give you best advice in this matter. Other pests of apples are aphis, green, leaf-curling and wooly, various kinds of scale, slugs, etc., so it would be impossible to give very definite suggestions without knowing more of the particular pests infesting this orchard. Method of mixing the arsenate for the codling moth is given in the Cultivator special pest fighting number of August 9, 1919.

Sick Avocado

I have an avocado tree three years old in my back yard and about three or four times a year the little branches and leaves will shoot out green and healthy looking then they will parch as if a frost had struck them, and I notice that the bark on some of the branches is parching as though they had been burned. This occurs on top of the limbs. It has plenty of water. What is the cause and what can I do with it?—A Subscriber.

Some named varieties and many seedlings sunburn badly, and this may be the cause of your trouble. If so, white washing the trunk and main branches will help much, even the leaves, for the white will repel the heat instead of absorbing it, thus lowering the temperature about the whole tree. Such conditions as you state, however, generally are the result of trouble below. Be sure your tree is not getting too much water or that the soil is lacking in drainage.

Subsoiling for Potatoes

I am a reader of the California Cultivator and like it very much. Will you please answer the following question: In preparing ground for Irish potatoes would it be wise to subsoil it? Soil medium sandy.—Subscriber, Chino.

Drainage is the first consideration in choosing soil for potatoes, therefore no mistake can be made in subsoiling, no other annual crop needing so deep and friable a soil. While superb drainage is necessary the potato absorbs much water in growing and in sandy soil humus is desirable to conserve soil moisture.

Plaster for Fertilizer

Please inform me if plaster taken from a plastered house is good as fertilizer on soil part clay and granite sand. Soil has not been cropped.—Subscriber, Elsinore.

That depends entirely on what the plaster is composed of. If it is modern day Portland cement plaster or of the plaster of Paris type of wall it would be worse than useless. If, however, it is of the old time lime and sand it will be of value especially on the heavier soil. This type of plaster breaks up readily and would probably pulverize and become part of the soil.

Bean Power Sprayers

Sprayiny Is Important

Don't experiment. Spraying is too important. An ineffective and inefficient sprayer is a time wasting, money wasting device.

Bean sprayers have cut spraying costs to the minimum. They eliminate troubles and money losing delays. They have led for 36 years. They are the standard for the world. Our patented features of superiority are described in catalog 33. Send for your copy today. Use the coupon.

The CHEMIST says=
"genuine GIANT is always uniform"

At every Giant Powder plant the chemical laboratory controls the processes of manufacture. They make continuous tests that insure the unvarying high quality of Giant Powders. Each pound of Giant Powder is exactly like every other pound of the same grade. Such uniformity means economy, efficiency, safety. Professional users of Giant Powders—miners, quarrymen, contractors—all know that the name "Giant" stands for utmost dependability in explosives.
When you have land to clear, trees to plant, subsoil to be broken or ditches to be blasted, tell your dealer to get for you one of the Giant Farm Powders—Eureka Stumping or Giant Stumping. Don't accept any ordinary dynamite, but insist on genuine Giant Powder, bearing the Giant trade mark on every box.

A postal will bring you our book, "Better Farming with Giant Farm Powders." Its 52 pages are full of short-cuts and labor-saving methods.

Cooperative Truck Routes

THE department of agriculture has been investigating certain cooperative truck associations and considers the movement of enough importance that it has issued Farmers' Bulletin 1032 on the suhject. Methods of organizing, financing and operating are given at some length, and the 24 pages of the hulletin are summarized as follows:

A study of the Farmers Cooperative Company of Harford County prompts the following general recommendations to communities who may contemplate the formation of a similar association.

1. Farmers motor truck associations can he operated successfully in sections which produce in sufficient quantity to warrant daily operation of trucks and which are not more than 30 or 40 miles distant from consuming centers. The quantity of produce for shipment should be more or less constant throughout the year. In the case of the Harford County association, milk and cream form the bulk of the load to Baltimore.

2. Before undertaking the establishment of a farmers trucking association a survey should be made to determine the adequacy of present transportation facilities, the reasonableness of r tes charged, the approximate daily tonnage which will be available for movement in each direction, the character of roads over which the trucks must be operated, the general sentiment of the community toward such an association, the number of persons who would immediately join the association, the amount of stock for which each person should subscribe, and the amount of cash that would be available for purchasing equipment.

3. Care should be taken to make the provisions of the charter or articles of incorporation broad and liberal, so that the association may extend its activities in such directions as may seem desirable at any time without seeking an amendment to its charter.

4. The capitalization of the association should be large enough to permit issuing enough stock to pay for the trucks in cash, to obtain a sufficient amount of cash on hand as working capital, and still have a sufficient amount of stock unissued to provide for future sound extension of the business. Unless this is done it will be necessary for members of the association to advance money or put up their personal notes so as to secure sufficient funds to begin operations.

5. To provide funds for replacing worn out equipment, provision should be made for a depreciation fund at the very beginning of the association's activity. A surplus or reserve fund to meet emergencies and to provide for expansion is also highly essential. Insurance on both the trucks and goods in transit should be carried. In accordance with sound accounting these charges should be considered in fixing rates.

6. Only men who have demonstrated business ability in handling their private affairs and who exercise a good influence among the members of the community should be selected for directors. For the secretaryship a man should be selected who has energy, tact and business ability and who has shown a keen interest in advancing the association.

7. Trucks should be selected only after a thorough and unbiased consideration of different. makes. Records of performance and of cost of operation and maintenance of each make, furnished by actual operators of trucks rather than by agents of truck manufacturers, should be carefully considered, together with the present and prospective needs of the association.

8. In the selection of operators merit should be the sole consideration. Fair wages and fair treatment will go a long way toward making the operators contented and satisfied to continue in the association's employ.

9. Rates should be based on a careful analysis of complete, adequate and accurate information regarding costs.

10. If one terminus of the route is in a large city, during the early days of the association it will be found more economical to rent limited space rather than to attempt to operate a receiving station. After the association has become well estahlished, it should then consider the operation of a central receiving station large enough to accommodate its own needs and those of several other operators. Such a station would prove more efcient and economical than the operation of individual stations.

11. Accounting methods should be simple but sufficiently comprehensive to show the exact financial status of the association at all times.

12. To make the association a real success, each member must feel that the association is his association. In determining matters of policy the interests of the members as a whole rather than as individuals must be considered. Service must be the watchword.

Investigating Federal Farm Loans

The Commonwealth Cluh of California, a power in the advancement of civic and state interests, is making investigation as to federal farm loans, or, rather, various proposed systems of financing the farmers of the state, with especial reference to long time loans with amortization features. To the end that it may have more definite information for its Section on Rural Credits, it is sending out a blank requesting information from farm operators. It is asking as to whether the one reporting is owner or tenant; number of acres cultivated; rate of interest on mortgage and commercial loans, and period for which loans are usually made; is a longer time than has usually been granted desirable; is it best to pay loan gradually or in a lump sum; are farm loans usually made hy banks or private loaners; what proportion of farmers is carried by storekeepers and commission men; what is the usual expense necessary in order to secure or renew loan; would you yourself horrow and extend farming operations under better loan conditions; do you think an association could he formed where members pledge their properties as in Europe, etc. These and many other questions are accompanied by a circular from which we quote:

"The Commonwealth Club is engaged in an investigation of the conditions under which farmers of California obtain credit either upon mortgage loans or upon short time loans, with or without security.

"The object of the study is to ascertain, if possible, whether the farmers of the state can be henefited by any change in our methods, and especially whether the methods of making rural loans, and especially small loans, which are in use on the continent of Europe, or any modification of them, are practicable under California conditions.

"For the information of those not familiar with European methods of rural loans, the following may be stated:

"Methods vary considerably, but the following is typical: Mortgage loans often, and perhaps usually, made for what we should consider small amounts by village cooperative banks whose capital and deposits are mostly supplied hy the members. None but members can borrow. All the property of all the members is pledged for the payment of all loans and there is little or no exemption of property from execution as with us. No member can be admitted except by vote of the membership. The average holding of members of these associations is less than 20 acres and probably less than 15 acres.

"These mortgage loans usually run from 20 to 50 years, or even more, with the privilege of payment wholly or in part at any time or upon any interest date. From one-half of one per cent to two per cent of the loan is added to the interest and paid each year. A payment on the principal of something over one per cent a year will extinguish the loan in about 33 years. This process is called 'amortization'

—a word which means 'to kill off.'

"These mortgage notes are pledged by the cooperative bank to a larger bank for more money with which to make more loans, and that bank, on a still larger bank to which it sells them, deposits them with a trustee and against them issues its own long time bonds, which are marketed on the exchanges and through banks like government, railroad and other securities. They are largely held by the thrifty in all parts of Europe. In this way a lower rate of interest can be obtained than by any other method.

"Another means by which money is saved to the original borrower is the nominal expense of conducting the original cooperative banks. The village doctor or schoolmaster often conducts the 'bank' in his own house, attending there once or twice a week to take in and pay out money, a service for which he receives a trifling compensation. The loans are made by a committee.

"Short time loans—often made to tenants—on such security as can be given or upon no security except known competence and character. These loans are made only for specific purposes named in the application and can be used only for those purposes. They are for small sums and are usually payable at harvest time. The 'bank' is safe, for all members are responsible for payment of all loans.

"The question is whether we can do anything of this kind in California, or whether any modification of this plan can be devised to suit our conditions, and in particular can a world wide market be made for mortgage bonds issued upon the pledge of long time amortized loans made on farms, especially small farms.

Which Plan Do You Prefer?

"There are at present being considered two distinct rural credit systems, as follows:

"The plan of establishing a new system of rural cooperative banks, which in turn are to establish a system of central banks and these in turn are to establish a rural national bank with headquarters in Washington, D. C. These banks are to market land mortgage bonds that are to be issued against the mortgages taken on the lands of farmers. It is estimated that by this system long term mortgages repayable in annual installments can be provided at an interest to the borrower of about six per cent per annum.

"A system of credit associations (known as the Weinstock plan), formed of neighborhood farmers who would issue long term land mortgage bonds against mortgages on their land, but who would find a ready market for them through such existing local bank as might be chosen by the United States postal savings department as a depository for proposed term postal deposits which are to be used by such existing local bank for the purchase of such land mortgage bonds, repayable in small annual installments. It is estimated that by this second plan the interest chargeable to the farmer would be about four per cent per annum."

COTTON PRODUCTION AND DISTRIBUTION

The crop of 1918 was the fourth successive small crop produced both in this country and throughout the world. The world's total for these four crops, not including linters in the United States was 70,883,000 equivalent 500-pound net weight bales, which compares with 87,355,000 bales for the preceding four years. Notwithstanding this reduced production the carry-over at the end of the season in this country was the largest ever recorded. Two factors were mainly responsible for this condition—the actual quantity consumed in Europe was very much below normal, although there had never been such a scarcity of cotton goods since the period immediately following the Civil War, and the transportation facilities for exporting cotton had not yet become normal. Another factor entering into the situation was the inability on the part of Europe to purchase cotton freely because of unstable conditions in some of the countries and because of the extraordinarily high rates of exchange.

During the 12 month period ending July, 1919, 5,765,936 bales of cotton and 457,901 bales of linters, a total of 6,223,837 bales, was consumed. This was the smallest amount reported for any year since 1915, and compared with the total of 7,685,329 bales in 1918, a reduction of nearly a million and a half bales, about 700,000 of which are accounted for by the reduced consumption of linters, due to the cessation of hostilities in Europe. Of the cotton consumed during the year, 51,183 bales were Sea Island, 126,087 Egyptian, 33,803 Chinese, 9,128 Peruvian and 7,098 other foreign.

The estimated production of cotton seed from the crop of 1918 was 5,360,000 tons. Of this quantity, 4,478,508 tons were used in the manufacture of cottonseed products. The production of crude products during the season was as follows: Oil, 176,711,000 gallons, valued at $227,316,000; cake and meal, 2,170,000 tons, valued at $116,119,000 hulls, 1,137,000 tons, valued at $17,917,000, and linters valued at $22,228,000—a total value of $383,580,000. This is a remarkable illustration of the utilization of what was formerly considered a waste and in many instances a nuisance. During the 12 month period there were 23,827,978 gallons of cottonseed oil and 155,813 tons of cake and meal exported. These quantities compare with exports of 42,448,870 gallons of oil and 739,533 tons of cake and meal for the season of 1914-15.

Does moisture on the windshield bother you? Try this: One ounce of water, two ounces of glycerine, one dram of salt. Apply the solution to the glass with a piece of gauze. Use downward strokes.

FARMING OUTRUNS DICTIONARY

A great many terms in common use in agricultural discussions have never found a place in the dictionaries. So widely used and important a term as "vitamin" has not yet found its way into the principal unabridged dictionaries. For the public, therefore, there exists no approved spelling, no approved pronunciation, and no approved definition of the name of a thing that is vital to all living things. There are scores of terms, indispensable in agricultural writing or speaking, that have not been recognized by the lexicographers, and there are quite as many new usages of established words. "Blood line," a term commonly used in discussions of breeding, is not in the dictionaries. Nobody knows whether it is one word, two words, or a hyphenated word. "Overrun," a term widely used to express the thing that is practically the determining factor of profits in creamery establishments, is unknown in the dictionaries. "Standardbred," "trap nest," and any number of other commonly used terms, understood well enough by agriculturists, remain undefined for the accurate information of the general public.

The United States department of agriculture, through the joint efforts of the bureau of animal industry and the division of publications, has begun a movement to standardize the use of such terms, and about 30 of them are on the griddle now. Three points of view are taken—that of the field man who knows the common usage of the layman, that of the scientist who has the view point of the specialist, and the point of view that looks merely to the use of good English. Each word is submitted to the various classes of persons interested, together with the proposed usage and the authority or lack of authority for it. From the suggestions received in reply, the finally approved usage will be determined.

The first agricultural term to be acted upon in the manner described was "corn belt." That was considered more appropriate than corn-belt or cornbelt.

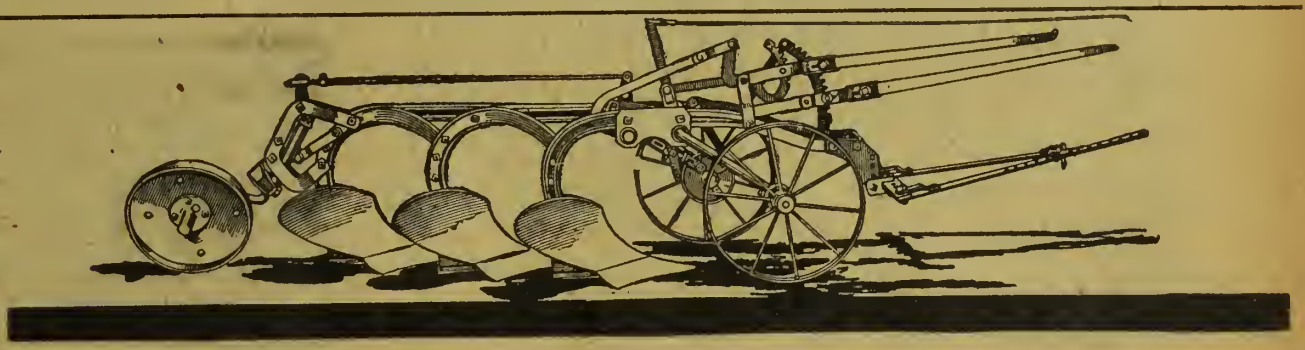
Forestry officials have determined that unseasoned or green posts, ties and poles in contact with the soil will last practically as long as seasoned wood.

In the case of railroad ties on the Northern Pacific Railway, Douglas fir ties which were seasoned lasted only 1.3 per cent longer than unseasoned ones.

It is said that the moisture content is the chief factor in determining the rate of decay. Granting the truth of this statement, it can be readily understood that a seasoned stick will very soon take up soil moisture until the stick contains as much moisture as the unseasoned stick, after which decay will proceed at the same rate in both.

All of the above applies only to wood which has not been treated with preservatives.

Oxnard, Ventura County, is organizing community centers.



Gets Up Close to the Rows Without Harming Trees

THE reversible hitch permits setting the John Deere No. 8 out to either side for work close to the row. Special lever adjustment permits angling the levers in where they are handy from the tractor seat, out of the way of branches and free of the tractor wheels when turning. Special wheel-base design permits close work without harming the trees.

JOHN DEERE No 8
ORCHARD TRACTOR PLOW

is just what you have been wanting. Note its special hitch and lever construction, illustrated below. It's an easily-handled, low-down, power-lift, three-bottom plow, especially designed for use with small tractors in orchard plowing. Good for general field work too. Full stock at San Francisco for quick distribution.

Be sure to find out all about this special John Deere plow.

Write today for a folder describing it. Address John Deere, Moline, Illinois. Ask for booklet O-67.

Bred Sows and Gilts

These sows and gilts will give you pigs that will be ready for the high market this fall. They are registered Poland Chinas and bred to our great herd sires. They are priced so you can make money—get into the business NOW. We will be pleased to write you full particulars. Address

Geo. V. Beckman & Sons Lodi, Cal.

At Private Sale

from the herd of champions. Largest winner at State Fair, grand champion boar at San Francisco. Bred gilts, open gilts and pigs from my prize winning big type Poland Chinas. Now is the time to buy. Write me for what you want and I will send you full description. My prices are not high. Write today.

J. F. LEHMAN LODI, CAL.

Caesar's Big Type Polands

Rosebud's Jumbo and Caesar's Buster two premier sires worthy to head any big type herd. When you want big type Poland Chinas write us. Usually something real good to offer.

THOS. CAESAR & SON, Reedley, Calif.

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

Hereford Points and Pointers

By R. R. Miller of the American Hereford Breeders Association

HEREFORD Points and Pointers was started in the last issue of the Cultivator and owing to the length of the article was necessarily continued. It appeals to the Cultivator as having particular value at this time in giving information regarding this great breed.

The points made in that issue had to do with the success which has been attained by the breed both at shows and fairs and on the range. Resistance to tuberculosis, their great size when fully developed, unerring prepotency, early maturity, hardiness, combined with quick sale on every market, were fundamentals underlying the founding of pure bred Herefords.

Continuing, Mr. Miller's article:

Many have hesitated to engage in the pure bred cattle business because of lack of knowledge of the habits, the feeding, the judging and value of the cattle. These are the most important points to be mastered and it is not advisable for one to start in the business on a large scale unless an experienced man is engaged to manage the herd.

Probably the most satisfactory way for the inexperienced is to purchase a few bred cows and heifers and "grow up with them." Invaluable knowledge is gained in this manner and as the essentials of the business are mastered greater expansion can be made and more capital invested.

Most of our prominent Hereford breeders of the present day started in a small way with a few cows and grew into the business with the natural increase.

The American Hereford Cattle Breeders Association will at any time gladly assist or advise any one contemplating purchasing pure bred Herefords.

Most farmers and stock raisers who have had considerable experience with cattle or other stock can successfully begin the pure bred business on a much more extensive scale. The principles of the cattle business are more or less the same whether grade or pure bred and the progressive man or woman can quickly adapt himself or herself to the new conditions

Probably the greatest difficulty that confronts the beginner is the matter of breeding and pedigree. With the form of pedigree used by the Hereford breeders, there is nothing complicated about it and after careful study of the tabulated pedigrees and the stock paper reports of the shows and sales, the most prominent lines of breeding can be easily determined.

The question of whether to buy a bull and select a herd of females to suit him, or to select the females and later find a bull that will be "nick" well, has been a matter of considerable argument, but the most common practice has been to select the females first.

The first consideration in the selection of the females is the type, conformation and size.

In coloring the Hereford should be a medium red. Too dark a red is objectionable, as well as too pale a red. They should have a clear white head without any red about the eyes or cheeks. The top of the crest should be white and this may extend back to the top of the shoulders, but should not be carried farther back than the shoulders. The breast and throat should be white, although it is not objectionable if the white breast is broken by a collar of red. The legs may be white up to the knees, but a majority of the breeders do not care for such white above the knees. More or less white along the underlines is admissible, but it should not be carried t o high upon the flanks. The switch of the tail should always be white. White spots or markings other than these on the body are objectionable. The head should be broad and short, tapering neatly from the eyes to the nose and present a distinctly feminine appearance. The muzzle should be white, with a wide open nostril. The horns should be flat, of medium size, tapering neatly from the head to the point, curving outward, forward and downward. The eyes should be good size, clear and bright. Ears of medium size and well carried. The throat should be clean and free from meatiness or rolls. The neck should be attached neatly to the head and gradually swell to meet the shoulders. The shoulders should be neatly laid in, not open on top, nor should the shoulder blades project above the backbone. The shoulder points should be smooth and all over these parts should be found a good thick covering of flesh. The chest should be wide and deep, giving an abundance of room for the vital organs. The ribs should spring well from the backbone, giving a roundness and fullness to the body, as well as giving a broad appearance to the back. The crops should be wide and well filled, the back strong, straight and evenly covered, the loin wide and deep, the hips should be wide apart, but not rough, the rump smooth and carried to the tail head on a level with the back and free from any tendency to patchiness. The quarters should be full, wide and deep, the twist should be full and carried well down the hock. The underlines should be straight and even, legs should be short, straight and well placed and present a good sized bone. The tail should be well set and taper neatly downward and have a heavy bush at the end.

California Perfect Lady

A cross-bred heifer, bred, raised and shown by the University at the International. The Hereford bull always stamps the white face on his offspring. Most of the cattle of the ranges of the West carry the Hereford mark.

The matter of pedigree and bloodlines is a topic much discussed among breeders. In the first place, never buy a pure bred for pedigree alone. Insist first upon an individual which measures up to the above standard and then look to the pedigree. The cow herd should be of the same type and conformation as individuals and then when that requirement has been satisfied, endeavor as nearly as possible to obtain females of the same general bloodlines. If this plan is followed a uniform herd is obtained and uniformity is unquestionably of great value in the pure bred business. A cow herd established on such lines will produce calves of a more or less uniform type and will, therefore, command a higher price when sold because of that fact.

All of the prominent breeders of the various breeds of livestock have attained their success through their

breeding toward a definite type and continually endeavoring to perfect it.

The next consideration is in regard to the age of the cows or heifers purchased. Naturally the most desirable plan would be to purchase the tried and true producers, but breeders and improvers continually cull out their poorer cows and will not consider selling their good producers at any reasonable price. Practically the only way to secure that kind is to purchase whole herds outright or obtain them at dispersion sales.

For the beginner, it is hardly advisable to purchase cows over five or six years old. Bred heifers, young cows with calves at foot and rebred probably yield greater returns on the capital invested. Such a plan allows one an opportunity to study the type of calves produced and thus help in the selection of a herd bull to mate with the females.

The selection of a herd bull is one of the most important, if not the most important matter considered in the founding of a herd. Each cow influences only her own calf while the bull is represented in every calf of a small herd, both in the first generation and in succeeding generations through his daughters in the herd.

The bull should be as nearly as possible of the same type as the females and the general characteristics the same, except that the neck is thicker and arched and he should show strong masculine character in his head and general makeup.

Select a type as an ideal to begin with and insist upon your bull possessing that type. Greater variation can be permitted in the selection of females than in the case of a herd bull. The bull should be strongest in those parts where the females are weakest, so that their calves will not show the weaknesses of either.

The bull, like the female, must first of all be a real herd bull as an individual and at the same time care must be taken to obtain a good pedigree. If he is a good individual and has ancestry which have repeatedly produced good cattle, then the bull may be expected to sire the same good kind.

A good individual without a good pedigree may reproduce as good or better than himself, but one cannot depend upon him to do this and nothing can be foreseen until his calves are dropped. There is where the true value of a pedigree is found. One can reasonably expect a well bred bull to reproduce a type similar to himself and a bull of indiscriminate breeding to produce offspring of the same nature.

It has been found by experience that certain strains "nick" well with others and where such has been found to be the case, advantage may be taken of such knowledge and a successful outcome expected.

(Conclud d Next Week.)

60-DAY OFFER
Extraordinary On Tulare County Land

Irrigated Land Ready for Summer Crops in the Rich County of Tulare, at $125 to $150 per Acre and On Easy Terms

3000 acres in 40 and 80 acre tracts, with water shallow lift, electric pumping plants, reservoirs, small buildings and sheds for stock; all fenced; near State Highway, schools and church. Some plowed and ready for summer crops. Between Pixley, on S. P. R. R., and Spa, on the Santa Fe R. R.

Suitable for rice, cotton, barley, wheat, sugar beets, broomcorn, peaches, pears, prunes, apricots, olives, figs, raisin grapes, almonds, walnuts, persimmons, alfalfa, dairy or hogs. Ducks thrive on the reservoirs; good range for turkeys and chickens.

For 60 days price $125 to $150 per acre. No higher. Terms one-fifth cash, balance on or before five years at 6 per cent interest on deferred payments.

This is your opportunity to purchase choice Tulare County land under irrigation that will pay for itself from the beginning. If interested, this offer should be investigated immediately.

Pixley California

Live Stock News Notes

The Diamond Bar Ranch, Spadra, purchased the famous Duroc-Jersey sow, Queen of Pathfinders, grand champion at the last National Swine Show, in the Putnam sale for $10,600. By this purchase California acquires one of the most famous sows the breed has produced and the influence of this sow on the development of the breed in this state will be difficult to estimate. Queen of Pathfinders is a daughter of the breed's great sire, Pathfinder, and she is the dam of Pathmaster, claimed to be the longest and tallest pig of the breed. Besides the sow mentioned, Manager Gatton has selected over $50,000 worth of popularly bred Durocs.

J. E. Thorp of Lockeford, reports the death of his herd boar, Freddy You'll Do. This boar was prominent at the 1919 Duroc shows and his death is a distinct loss to the Thorp herd.

A number of young draft stallions will be sold at auction at the university farm during Livestock Week. M. Bassett of Hanford will consign a son of Ithos, champion Percheron for several years at the state fair. Henry Wheatley of Napa consigns one by Desford Banker and the university will also sell a two year old by the same sire.

Professor Gordon H. True, head of the animal husbandry division of the University of California, has been confined to his home by illness. It is expected that True will be able to take a leading part in the activities of Livestock Week.

Chas. M. Talmadge of Washington, well known to the livestock interests of the West as a breeder of Berkshires, attended the recent Berkshire sales.

Foothills Corporal, grand champion milking Shorthorn bull at the 1919 Pacific International, Portland, has been purchased by Thos. Harrison of Santa Rosa from W. B. Ayer of Portland, Oregon.

J. A. Bunting, proprietor of the Mission herd of Herefords, Mission San Jose, has just purchased the 700 acre ranch that he has had under lease for a number of years. Mr. Bunting expects to enlarge his herd as rapidly as possible. He is also establishing a flock of Hampshire sheep.

Shorthorn Steers

The Shorthorn steer carlots at the International, Chicago, sold for $25.69 per cwt., the highest average of any breed.

Thos. Johnson, Columbus, O., sold 100 Shorthorn steers last October at the farm for $19 per cwt. They weighed 1,592 lbs. making a gain of 400 lbs. in five months.

It pays to grow Shorthorn beef.

The Milker You Have Hoped For

The De Laval Company now offers to the world's dairymen a perfected and proved cow milker, worthy of the name "De Laval."

The thousands of users of De Laval Separators during the past forty years, and also their neighbors, will appreciate that this means a great deal more than a simple announcement.

The De Laval Milker comes to your aid with the Company's full knowledge that you will expect more of the De Laval than of any other milker. For three years it has been in daily use on several thousand cows of various breeds, under all of the varying conditions to which a milker can be subjected. The universal satisfaction it has given confirms the Company's conviction that it will add a new impetus to the dairy industry, and justifies your unqualified confidence in this latest De Laval production.

The De Laval Milker is distinctly different, possessing many new and exclusive features that are of inestimable value to the careful dairyman and owner of valuable cows. Its action is positive and uniform from day to day, and it is faster, more reliable and more sanitary than any other method of milking.

An additional insurance of lasting satisfaction to users of the De Laval Milker lies in the De Laval Company's well-known facilities and reputation for service.

It pleases the cow. It will, therefore, please you.

Write to nearest De Laval office for Milker Catalog, stating number of cows being milked

ADDED POWER ◇ SAME WEIGHT

The Cletrac Way Makes Farming Pay

The Cletrac's Day Is Here

The tide has turned. The *big* demand today is for the small tank-type tractor—for the Cletrac—that goes further than the simple job of plowing and takes the place of horses over plowed ground and seedbed, working faster and at lower cost.

It wanted only the marvelous success of the Cletrac in 1919 to make the bulk of farmers *everywhere* put their "OK" on the small tank-type. And now because the Cletrac *is* the "fashion"—because a greatly increased output, means a lower manufacturing cost—*we can offer a better Cletrac and still reduce the cost to you.*

With more power and improved construction, 1920 will prove to any farmer, anywhere, that Cletrac farming is *profitable* farming.

The Cletrac is the right size and type for almost any farm, the one tractor adapted to all conditions. It has proved its ability to stand up to its work. And now that the public has recognized its worth, it is out in front to stay.

The quick popularity of the Cletrac is not an accident. Engineers and army experts long ago saw the great advantages of the endless track as a device for turning motor power into drawbar pull. The farming public only waited to see the same principle built into a *serviceable* small tractor. The Cletrac proved to be that tractor. It made lifelong friends from the start.

One Cletrac on the small farm—a "fleet" of them on the big ranch—makes an ideal all-year power plant. The Cletrac is light, but powerful, with plenty of pull for heavy plowing and work in the hills. And it rides the low spots or plowed ground without miring, but still pulls a profitable load.

Turns short and works the corners clean. Compact and low-set, ideal for orchard work. Travels faster and does more thorough plowing. Burns "gas", kerosene or distillate. Does *more kinds of work, more days in the year,* at lower cost. You can't go wrong on it

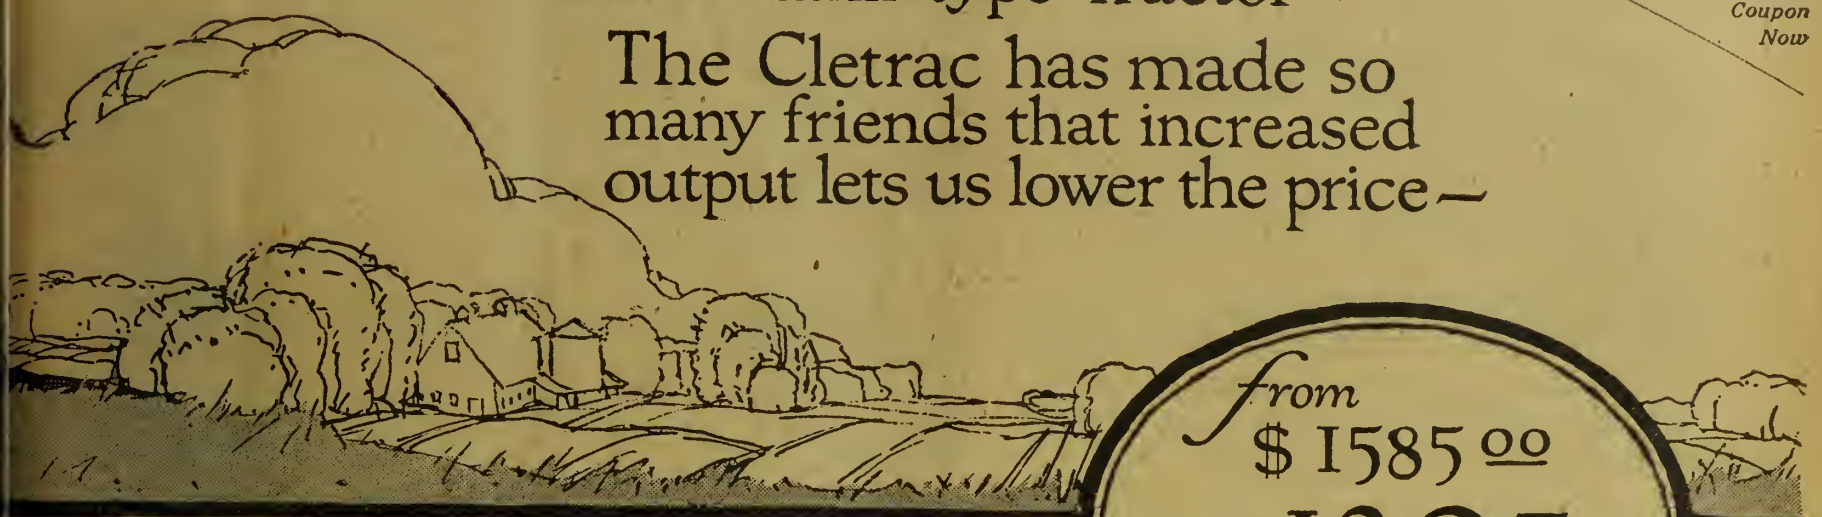
The Tide has turned to the Small Tank-type Tractor—

The Cletrac has made so many friends that increased output lets us lower the price—



LOWER PRICE

from $1585.00 *to* $1395 *f.o.b. Cleveland*

In the improved Cletrac you get all the little refinements an honest builder makes with each year of brass-tack experience. And you get certain big features that make it a better performer than ever.

A bigger motor and the added strength to handle the increased power are furnished with no extra weight and no more friction, saving you *all* the power we've added.

The new 8-inch track—one-third wider—means a lighter tread and stronger grip on the ground—makes the Cletrac that much more sure-footed and adds to the life of the tractor itself.

The Cletrac steering device, an exclusive feature, insures positive power to *both* tracks *all* the time and gives full power on the turns, as well as straightaway.

Our new water clarifier takes out all the dust that would grind your pistons and overheat your motor—moistens the air and makes the engine run as smooth at noon as your auto on a dewy night.

Here is a tractor, always a vote-getter, now more powerful, now better built, and costing you less. No wonder the best tractor dealer in your community wants to handle it. A tractor that makes friends for itself makes satisfied customers for him.

Right through the year—hauling manure in the Winter—plowing, harrowing and seeding in the Spring—harvesting, threshing and silo-filling—road-building, ditching and grading—shelling corn and sawing wood—here's a tractor you can depend upon.

It's a tractor that has all-year service built into it, one that cuts farming costs by handling *all* jobs well, not just a few. And over 1200 distributors and dealers, with repair stocks near you, are backing it up to make every Cletrac owner a booster.

There's a good dealer close by who will gladly show you a Cletrac. Talk to him now. Get ready to start Cletrac farming this Spring. Line up with a majority and make power-farming really worth while.

More Kinds of Work More Days in the Year

TANK-TYPE TRACTOR

The Guaranty Sale

The Annual Holstein Classic will be held at

Sacramento, on Wednesday, March 25, 1920

Twenty California breeders, three Washington breeders, and one Nevada breeder will send to this sale positively the greatest lot of registered Holstein females ever assembled in a western sale.

There are ten cows with records from 30 to over 35 pounds butter in 7 days, a very large number with records from 25 to 29 pounds, many of which have completed yearly records or are now on yearly test.

No Holstein sale catalog ever before issued in the west has shown such an imposing list of reference sires, the bulls to which the sale females are bred.

The Committee of Selection has secured what we believe to be the ten best bulls available for this sale, and the list will surely interest the man looking for a high class herd sire.

Detailed announcements of the offerings will appear each week up to sale time. Watch for the announcements, and write for a catalog now.

Prince Walker Cornucopia

The Highest Record Son of Prince Gelsche Walker

His dam ALBA SADIE CORNUCOPIA CREETA has just completed official records of 36.26 pounds butter from 516.7 pounds milk in seven days. Her previous records were as follows:

At seven years—
Milk 338 days 13,849.40
Butter 866.23
At six years—
Butter seven days 24.13
Milk 532.40
At five years—
Butter seven days 23.85

She is a daughter of Sir Sadie Cornucopia, son of the first 30 pound cow, Sadie Vale Concordia.

Over 60 of our best females are bred to PRINCE WALKER CORNUCOPIA, and he will be given the fullest opportunity in this herd. Put one of his young sons at the head of your herd.

REGISTERED HOG SALES A SPECIALTY

THE HEREFORD SALE NEXT WEEK

The fourth public sale of the Pacific Coast Hereford Cattle Breeders Association which will be held at the university farm, Davis, next Tuesday will consist of 58 head, including 26 females and 32 bulls. The offering has been selected from eight of the leading herds owned by members of the association.

J. H. Cazier and Sons of Wells, Nevada, are sending six cows, three of which will sell with bull calves at foot and four will sell carrying the service of Beau Blanchard 76th. Beau Blanchard 76th is a son of Beau Blanchard rated by all as one of the greatest sires in the Hereford breed. Messrs. Cazier purchased this bull last year at a cost of $10,000. Two of the cows are bred to Harris Standard 2d and Debonair 64th, the sires of the three calves that sell with their dam. The Cazier Herefords are regarded very highly by Western cattlemen and the fact that the blood of Beau Blanchard is available in their consignment will doubtless be an attraction of the sale.

The University of Nevada has entered four head, two bulls and two females. Madera Patricia is one of the most attractively bred cows in the sale, being sired by a son of Paragon 12th and out of a daughter of old Lord Earling. The two bulls are sons of the university herd bull, Beau Perfection 34th, a grand son of Perfection, the sire of Perfection Fairfax. The cows sell bred to Beau Perfection 34th.

The University of California sells a two year old daughter of Prince Lad 11th, the sire of so many of the famous steers developed by that institution.

W. D. Duke, formerly of Likely, but now located at Gazelle, is one of the heaviest contributors.

Duke sells 14 head, six females and eight bulls. The entire lot have been bred by Duke from the blood lines developed by Governor Sparks. All the cows sell with calves at foot sired by Panama 33d, a son of Cuba Panama, the bull that has made a splendid record in the Cook herd in Montana, and are bred to Mystic Debonair. The eight bulls are all sired by Panama 33d.

John A. Bunting, Mission San Jose, has but one entry, Mission Prince, first prize senior calf at the last state fair. He is a son of Hopeful Prince 2d, a bull bred and used by the university and sold in the sale a year ago to the university of Idaho.

The W. J. Bemmerly consignment consists of six two year old heifers and three bulls. Two of the heifers are daughters of Mr. Perfection and four are by New Era 2nd, a splendid breeding son of Debonair. All of the females carry the service of Bonnie Brae 96th, by Bonnie Brae 3d. Two bulls are by New Era 2d and the third is a son of Bonnie Brae 96th.

Veramont herd, owned by H. M. Barngrover, is represented by an especially well bred lot, consisting of two females and six bulls. The two females are full sisters sired by Patrician 5th, a grandson of Paragon 12th, and one is in calf to Don Woodford 4th, a grand son of Woodford. Two of the bulls are by Edgewood, sired by Mischief Mixer, the $7,300 son of Beau Mischief. Beau Mischief is the bull that was largely responsible for the record breaking sale of Mousel Brothers. One bull is by Prince Lad 11th, referred to above, two are sons of Patrician 5th, and one is by Sonoma.

No California herd has more Gudgell and Simpson breeding than will be found in the Rule herd and the 15 head entered by that herd are highly desirable. The three females will sell with calves at foot. Two are daughters of Simoon 5th, and one is a grand daughter of Beau Dandy and two are grand daughters of Beau Picture. In the Mousel sale daughters of Beau Dandy averaged $4,467 and daughters of Beau Picture averaged $2,262. Eight of the bulls are sons of Sonoma, two are out of dams by Bright Stanway, two out of Beau Picture dams; two out of Beau President dams, one out

The Consignment sale of the California Poland China Breeders Association advertised for Feb. 26, Stockmen's Week at Davis, Cal., has been postponed.

Moving pictures of the National Swine Show (1919) will be shown in the Auditorium at University Farm Wednesday evening, Feb. 25th. All Stockmen invited.

GUERNSEYS

$546 was the Average Price paid for all Guernseys sold at public auction in 1919. This figure indicates the buyers' high estimation of the value of the breed. Let us tell you WHY Guernseys lead in popular favor.

QUALITY ECONOMY QUANTITY

The Duroc-Jersey Sale of the Season

Dr. Belknap of San Jose, Cal., will on

MARCH 10

beginning at 12.30 o'clock

sell one of the finest breeders herds on the Coast. Orions, Great Wonder I Am, Colonels, Pathfinders, etc. Some of them mammoth in size. Great boar pigs and the herd Orion boar, a crackerjack. A surprise is in wait for the Duroc fanciers. Catalog will be out in few days; send for your copy.

Auctioneer, Ord L. Leachman

Bruce S. Bennett, Field man for Cal. Cultivator
Ted Cameron, Field man for Pac. Rural Press
T. H. Moore, Field man for Rural World

of a Domino dam and one out of a Beau Dandy dam.

The sale is to be managed by C. L. Hughes of the California Breeders Sales and Pedigree Company and Col. Ben A. Rhoades of Los Angeles will be the auctioneer.

DUROCS SELL WELL AT TULARE

The sale of Duroc-Jerseys held in Tulare, February 12, by the Tulare County Breeders Association was the most successful of any yet held by that association.

Sixty-two animals sold for a total of $7,195 or an average of $116, the better animals selling for very satisfactory prices. The top of the sale was an open March gilt by Brookwater Regulator, dam Miss You'll Do, consigned by Joe N. Chinowth and purchased by R. E. Chinowth, Visalia, for $1,125. She showed remarkable development and is probably one of the best spring gilts in the state.

C. C. Ellis, Exeter, who is establishing a herd secured from the R. C. Sturgeon consignment a Critic B sow for $550 and two from the Conejo Ranch for $385 each.

Greenwood Farms, Live Oak, consigned two bred gilts to the sale bred to Johnson's Defender Jr, one going to Winsor Ranch, Bonita, for $150, the other to J. Kinkaid, Bakersfield, for $230. Geo. C. Aydlott, Hanford, secured two from the Conejo Ranch consignment at $200 each. Post Card Ranch, Corcoran, was the most liberal buyer, securing about one-half of the offering. Geo. W. Bell Tulare, was the auctioneer, and the 62 head were sold in less than three hours.

Following is a report of animals selling for $100 or more.

2, L. P. Philly, Tipton, $100.
9, Allen Thompson, Tulare, $300.
10, J. Kinkaid, Bakersfield, $155.
11, R. E. Clifford, Strathmore, $140.
17, Greenwood Farms, Live Oak, $100.
30, C. C. Ellis, Exeter, $100.
34, Winsor Ranch, Bonita, $110.
36, Winsor Ranch, $150.
37, J. Kinkaid, Bakersfield, $230.
40, Geo. C. Aydlott, Hanford, $200.
41, C. C. Ellis, $385.
42, C. C. Ellis, $385.
43, Geo. C. Aydlott, $200.
51, C. C. Ellis, $550.
53, Post Cart Ranch, Corcoran, $140.
54, R. E. Chinowth, Visalia, $110.
57, W. E. Hughes, Hanford, $285.
63, R. E. Chinowth, $1125.

The Kings County Poland China Breeders Association will hold their ninth semi-annual sale in Hanford, Saturday, February 28. These sales have been the means of making Kings County the leading Poland China county of the state as well as adding new breeders to the ranks. They have scattered Polands from one end of the state to the other and there is scarcely a herd in which you will not find animals that were sold in one of these sales.

Selections from the county's leading herds will be found in this sale, many of which will as in the past go to found new herds.

The Henderson Company of Sacramento, has sold Manteca Farm, commonly known as the Henderson Ranch, to G. Ellinwood Finnell and Russell Richardson of Sacramento. The ranch is near Elliott, San Joaquin County, and consists of 600 acres. The new owners plan to establish a large and select herd of Hereford cattle and to maintain a large herd of Duroc-Jersey swine. The ranch which has been conducted as a Holstein breeding establishment is well equipped for handling all classes of livestock.

Moving pictures of the National Swine Show, 1919, will be shown in the auditorium of the University Farm, Wednesday evening, February 25. Swine men are urging a very general attendance at this exhibit.

BEEMAN ONE HORSE TRACTOR —replaces the horse

We Have It On Display

THE Beeman One Horse Tractor, which you have seen advertised in the Country Gentleman, Farm and Fireside and other magazines. It solves power and labor troubles on large and small farms, does any farm work ordinarily done by one horse, mule or by hand. It will plow, harrow, seed, plant, cultivate, mow hay, mow lawns, haul loads.

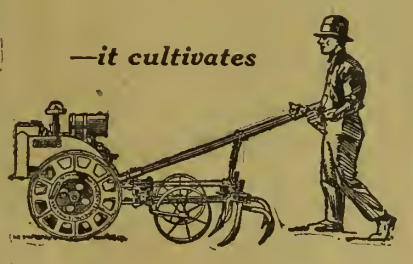
It is also a self-propelling 4-H.P. gas engine for belt work. Operates the churn, feed grinder, cream separator, pump jack, washing machine, etc

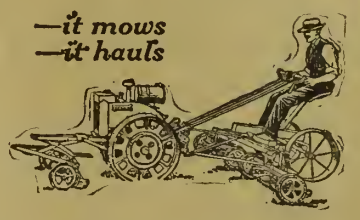
It's Dependable and Economical

It's always ready—any time of day or night—for any job anywhere you want it done. It steps right off and starts to work. It doesn't waste time resting or cooling off. It works all day on 2 gallons of gasoline and one quart of oil. You don't have to feed it or take care of it when it's not working.

It enables the farmer with a large tractor to completely motorize his farm—it does the work that he now does with horses or by hand.

To the truck gardener, fruit grower, flower raiser, suburbanite and others who cannot use a large tractor it brings the more efficient, reliable and economical motor power method—it means independence from hired outfits, drudgery and labor troubles. It is useful the year 'round on all kinds of farms. It is the original one-horse tractor—fully developed and proven by years of service on thousands of farms. Come and see for yourself how efficiently it works.





Model G, the Special California Type Beeman

Is Built Especially to Meet California Conditions

It has 20% more power and 50% greater traction than the previous model.

THE DIENER TOMATO

(*Blight Resisting*)

Awarded Gold Medal at the California Industries and Land Show, Oct. 5, 1919.

Nine Tomatoes in One Cluster--All Ripe. Weight, 7 Pounds

The largest and most desirable tomato ever created. Unexcelled for table use, for canning, for tomato sauce, and for dehydration.

30-40 tons of ripe fruit of remarkably uniform size, produced to the acre.

The Diener Tomato plant is also blight resisting. Thousands of acres of tomatoes have been ruined in the last few years by blight; but this tomato has been grown side by side with such varieties without being affected by blight.

The fruit has reached a size of three pounds, but the average is a one-pound fruit, unusually smooth. The flesh is more solid than of any other tomato known, making this variety so valuable for dehydrating purposes. This tomato is of a deep red color and very attractive to the eye.

The Diener Tomato is specially useful in many localities for the fact that, after being properly started, it is practically drought resisting.

The Diener Tomato is an excellent shipping variety, ripe fruit having been successfully shipped from here to New York.

Price of Diener Tomato Seed, 50c Package. Per Acre Package, $1.50

Diener's Gladioli are the best and finest in the world.

(AWARDED GRAND PRIZE AT P. I. E.)

They are equal in beauty to the orchid; every shade of color has been attained and prices are now within the reach of everybody.

DIENER'S RUFFLED MONSTER PETUNIAS

have created a sensation wherever grown or exhibited. As they are continually flowering all summer there is hardly anything giving flower-lovers more satisfaction. Seed comes in separate colors—red, pink, white, purple, flesh—pink, frilled, white frilled, variegated and mixed colors. Price, per package **50c**

OUR CATALOGUE showing natural colored plates of Gladiolus and Petunias will be sent upon receipt of 10c, which will be deducted if order follows.

Notes of the Cattlemen's Association

The fourth week of the membership drive shows no flagging of interest among the cattlemen. Meetings held three and four weeks ago are still producing results in the shape of signed applications for membership, renewals of dues and letters of inquiry.

There are two misapprehensions in the minds of some stockmen that the association is anxious to clear up.

First, the California Cattlemen's Association is not a price fixing organization and membership in the association does not give the association any legal control over the members cattle. The association does aim to help its members to market their stock to the best advantage by getting buyers to go to auction sales, by shipping cattle to outside markets during the glut season and by providing members with information on market, feed and railroad conditions. Members, however, are not bound in any way to follow the association's advice or be guided by its information.

Second, the California Cattlemen's Association has no official connection with the state cattle protection board though working in complete harmony and cooperation with it. Money paid to the state board for brand recordation or renewal does not go to the California Cattlemen's Association and a payment of that kind does not make anyone a member of the cattlemen's association. Some cattlemen have sent their brand payments to the association in the belief that this amounted to paying the association's dues. In every case this money has been forwarded to the state board.

* * *

California breeders of pure cattle strains are preparing to go into world markets with their products. Backed by the California Cattlemen's Association an intensive campaign will be launched to establish more pure bred herds through this state to meet the rapidly growing demand in Australia, South America, the Hawaiian Islands and the Orient.

"California at present scarcely can meet the demand in this state for good sires, and unless we have more herds at once we must stand aside and see pure bred cattle from the East go through our ports to the other countries bordering the Pacific," said C. N. Hawkins, president of the California Shorthorn Breeders Association, in an interview. "It is a pity that when Californians call upon us for sires we must often go East to get them. Here is a tremendous market at our doors. We have a state wonderfully endowed by nature for the raising of pure bred cattle. Almost every farmer could handle a small herd. With hundreds of small herds through the state California soon could capture the foreign trade and eventually might even supply the East with the best of blood strains.

"It is time that we seized this opportunity. Every farmer in California should be told, through a wide educational movement, how he can profit by establishing a herd.

"The Stockmen's Week at the university farm seems a good time to launch this movement. At that time the cattlemen of six counties affiliated with the California Cattlemen's Association will hold meetings at Davis and we hope then to get from those meetings an expression of opinion on the best means to go about spreading the gospel of pure breeding and capturing the tremendous markets that await us."

The six counties meetings referred to by Mr. Hawkins will be held on the same days as the Hereford and Shorthorn sales. Yolo, Sutter and Colusa County cattlemen will meet Tuesday, February 24, while Solano, Sacramento and Napa County cattlemen will meet Wednesday, February 25. The membership campaign of the California Cattlemen's Association will be given a strong impetus at that time as many of the members are planning to bring with them neighbors who have not yet joined the association. Cooperation between the cattlemen of adjoining counties will be discussed by men prominent in the cattle industry.

* * *

David J. Stollery, secretary of the California Cattlemen's Association, spoke before the Meat Packers Institute last Tuesday afternoon in San Francisco. Mr. Stollery laid stress upon the auction sales of prime cattle to be conducted by the association in cooperation with the county farm bureaus and suggested that if the packers desired to win the confidence of the stock producers they could go a long way in that direction by having their buyers at those sales. Mr. Stollery also suggested the formation of a local committee of packers to consult with the cattlemen on problems affecting both. A joint campaign to induce the public to "eat meat intelligently" also was touched upon by Mr. Stollery. The packers in the regional conference were not empowered to act upon these suggestions but it was indicated that steps would be taken toward favorable action.

* * *

The meeting scheduled for March 13 at Livermore has been postponed until May 1 as that time was best suited to the needs of the Alameda County cattlemen. A meeting at Hanford has been arranged for March 13 to replace the Livermore meeting in the association's schedule.

* * *

President Fred H. Bixby has been in Southern California making arrangements for the semi-annual convention of the association to be held at Los Angeles some time in April.

The stockmen south of the Tehachapi are on the job and when the convention opens there will be no lack of attendance or interest.

THE TULARE POLAND CHINA SALE

The second sale of the Tulare County Poland China Breeders Association was held in Tulare, February 6. The top of the sale was the bred gilt King's Quality by Kansas King and bred to The Californian. She was consigned by A. J. Elliott and was sold to R. J. Soulz, Tulare, for $400.

Fortune Maid by Story's A. Wonder from the consignment of Hugh C. Shinn went to V. Dubel for $365.

Stream Line Sallie and litter sister brought $320 each, H. D. McCune, Lemoore and Fred D. Ross, Hanford, being the purchasers. Among the visiting breeders were A. D. McCarty of McCarty and Starkweather, Modesto; Les McCracken, Ripon; Walter C. Ficklin, Fresno; A. J. Van Cleef and W. L. Choisser, Riverdale; H. D. McCune, Lemoore; W. L. Haag & Son, Wm. Bernstein, M. and A. L. Bassett, Fred D. Ross, Hanford, and Thos. Caesar Reedley. Geo. W. Bell, Tulare, was the auctioneer. The following sold for $100 or more:

1. V. Dubel, Three Rivers, $365.
2. M. and A. L. Bassett, Hanford, $240.
3. H. D. McCune, Lemoore, $320.
4. F. D. Ross, Hanford, $320.
5. Z. M. Dickey, Dinuba, $160.
6. R. F. Guerin, Tulare, $175.
7. B. S. Cole, Hanford, $145.
8. Thos. Caesar & Son, Reedley, $120.
9. R. S. Smith, Delano, $100.
10. C. Sunkel, Tulare, $190.
11. R. J. Soulz, Tulare, $400.
12. W. L. Haag and Son, Hanford, $120.
13. R. J. Soulz, $100.
14. R. S. Smith, $100.
15. B. S. Cole, $150.
16. R. J. Soulz, $100.
18. R. S. Smith, $100.
19. R. J. Soulz, $115.
26. Wm. Bernstein, Hanford, $100.
30. E. H. Futrell, Terra Bella, $100.
34. R. J. Soulz, $125.
46. W. Polly, Tulare, $150.
56. Wm. Bernstein, $100.

The country's biggest rancher—what he thinks about the packers

Robert J. Kleburg is manager of the "Million Acre Ranch" in Texas. He keeps about 40,000 breeding cattle. The following is from his remarks made recently before a committee:

"Their (the packers') business prospers most when they have an ample and regular supply of live stock from which to draw.

"It therefore follows, as a matter of course, that it is to the interests of the packers to foster, not to hamper, live stock production. In order to do this they must pay the producer of live stock a fair price for his products, so that he, the producer, may be enabled to stay in business.

"I therefore contend and believe that the producer of live stock who conducts his business properly has nothing whatever to fear from the packers. He needs the packers to prepare his product for the market and to distribute it.

"Without the aid of the packers the production of live stock could not exist as an industry.

"I can well remember when there was no real market for live stock in the part of the country in which I lived—southwest Texas.

"In those days we drove the steer to the butcher's pen. The butcher would slaughter him, throw away the head, horns, hoofs and other offal, and give the producer credit for so much meat at his shop. All of this waste is now saved and marketed. * * * *

"I believe that when a business is as big as the packers' business, that business has to be conducted properly and on business lines and on principles of fairness to the public.

"I do not believe they can afford in their own interests to conduct their business in such a way that it injures the great mass of people with whom they do business. * * * *

"Nor do I believe that the packer can control the law of supply and demand."

STOCKMEN'S WEEK

Stockmen's Week at University Farm, Davis, February 24-27.

At a meeting of the representatives of the California Cattlemen's Association, the California Swine Breeders Association and the various pure bred livestock associations on April 26, 1919, it was voted that plans be developed for a stockmens' week. These plans have developed into the following program:

Tuesday, February 24

9:30—Greetings, Dean Van Norman; opening address, Professor Gordon H. True. Development of Calf Clubs in California. Discussion. Range Classification, T. N. Lorenzen. Business meeting, Pacific Coast Hereford Cattle Breeders Association. Meeting Yolo, Sutter, Colusa Counties Association, C. C. A. Community Range Management, T. J. Jones. The Present Status of the Livestock Industry, Dean Hunt. Pacific Coast Hereford Cattle Breeders consignment sale. Draft colt consignment sale.

Wednesday, February 25

9:30—Address, F. H. Bixby, president California Cattlemen's Association. Ways and Means of Range Development, H. H. Simpson. Organization meeting, Aberdeen-Angus Association. Meeting Solano, Sacramento, Napa County Association, C. C. A. How Ranch Management is Reflected in Range Management, E. E. Clark. Supplemental Feeding of Range Cattle, Geo. H. Wilson. Address, David P. Barrows. California Shorthorn Breeders Association consignment sale.

Thursday, February 26

9:00—Annual business meeting, California Swine Breeders Association. Marketing, Roy Filcher. Starting in the Hog Business, J. Francis O'Connor. Buying and Selling Pure Breds. Feeding, Professor J. I. Thompson. Killing and Curing Pork on the Farm, C. E. Schmidt. Meeting California Poland China Breeders Association. California Poland China Breeders' consignment sale. Motion picture film, "Hearts and Jerseys." Address, by Guy H. Miller, American Jersey Cattle Club.

Friday, February 27

9:30—Value of Cow Testing Association to the Farmer and the Community, J. R. Gallagher. Address, How to Get the Most Out of Cow Testing Associations, Noel Negley. The Present Dairy Situation, S. H. Greene. What Cooperation Means to the Dairy Farmer, John S. Watson, Dixon. The Proposed California State Dairy Cow Competition, 1920-22, Professor F. W. Woll. Showing Representatives of Breeds in University Dairy Herd, C. V. Castle. The Bull at the Head of the Dairy Herd, Professor C. W. Rubel. Auction sale of pure bred Jersey, Guernsey, Holstein and Ayrshire bulls from cows with over 400 pounds of butterfat as year's record. Meeting of California State Jersey Breeders Association.

A GREAT THING IS CHARITY

The following, which appeared in a recent issue of the Berkshire World under the name of W. S. Guilford, is worth passing on to our readers who are interested in livestock:

"I don't profess to be much of a preacher, but there is one point where real religion and the hog business get pretty close together.

"That time is when I get a pig, or you get one, or Bill Jones gets a pig from some other breeder—a pig sired by the breeder's famous and well advertised boar—and the pig does not turn out right. Maybe the pig develops into the orneriest runt on the place.

"Now when this happens, am I, or are you, or is Bill Jones as charitable as a good breeder should be?

"Do I, or do you, or does Bill Jones do what we would like to have done with this pig if he came from our herd instead of the other fellow's?

"If it happened to us we would want the pig knocked in the head and put in a hole in the ground or sent back—and we would be glad to refund the purchase price—wouldn't we? I know we would.

"But how often does it happen that if the animal is a boar, for instance, he is castrated and run with the sows or a bunch of pigs, and every visitor to the place is told all about him?

"I'm not saying it isn't human nature to do this, for I know it is, but it really is a rotten thing to do, isn't it?

"I can recall far enough back to recall getting pigs that were 'bums' that I was not as careful to hide out in a back lot as I was one of our own sows that didn't happen to do well, and this confession is made so that I can relate a few on the other fellow.

"Sometimes the fault is as much with the purchaser as with the pig. I know of one case where a breeder bought a boar pig by a famous boar from a famous breeder. The pig was kept by himself in a small pen and lot, worried a good deal, and for a long time did not develop at all satisfactorily. The breeder who bought him was considerably interested in another family of hogs and for more than a year the breeder who sold the pig in question received a great deal of bad advertising, for the attention of everyone who came to the place was called to the bad points of the boar and he was especially charged with being a producer of poor pigs. I do not believe the breeder who had the pig realized how this talk sounded. He surely never thought of the 'do unto others' side of it. Lots of us don't—about this and many other things. It often happens that pigs go through a period the same as children—then come out all right.

"This was the case of the boar in question. He finally sired pigs that won in strong competition.

"I saw a stag in a prominent herd recently, a pig sired by a famous boar, but one that did not develop right, and if he had been in an out of the way place where he could not have been seen it would have been better for all concerned. And if the breeder who now has him had sent out a pig by one of his good boars and he had not developed right, and the man who had bought him had castrated him, the breeder would have appreciated it if the owner of the stag had put him in a back lot and forgotten to say anything about him to anyone.

"In discussing a boar one breeder

SEEKING A MARKET FOR DAIRY BY-PRODUCTS

EVERY dairyman will agree that if he could sell his skimmed milk for what it is worth as a human food, the profits on his dairy business would be substantially increased. But where is the market for skimmed milk as a human food?

Authorities say that the milk supply of the country is twenty-five percent below the domestic market requirements, if each man, woman and child of this country, to say nothing of foreign needs, is to receive the amount of dairy products necessary for proper nourishment. This, then, is the market—helping to make up the 25% shortage by diverting to human use a part of the large quantity of skimmed milk which is fed to stock. And here is one method by which this can be done:

Skimmed milk lacks only a fat content to make it desirable for cooking and baking. The lack of fat, too, makes it unpalatable. Hence, it is just plain common sense that, with the addition of a vegetable fat, skimmed milk can be made palatable and more desirable as a human food for culinary operations, releasing whole milk so used for other more needed purposes.

Hebe Brings Skimmed Milk to Market as Human Food

HEBE was created to reach this additional market—*to serve as an auxiliary to the daily milk supply for specific uses in the home.* Hebe is labeled with the utmost frankness as to its contents and uses. It is advertised as it is labeled—honestly and frankly—"A Compound of Evaporated Skimmed Milk and Vegetable Fat," for cooking and baking. By the scientific emulsifying of refined cocoanut fat with the skimmed milk, Hebe makes it possible to market skimmed milk as a human food, and thus opens to the dairyman another and more profitable outlet for his by-product, without interfering with the markets already established for dairy products. In the production of every 100 pounds of Hebe 210 pounds of skimmed milk are used, and 7.8 pounds of cocoanut fat. Thus a small amount of vegetable fat serves as the vehicle for bringing a large amount of skimmed milk to market as human food.

Benefit to the Entire Industry

HOW is this new market to benefit the dairyman who is not near enough to a Hebe condensery to sell his product there? The Hebe industry is young, and Hebe plants few in number, but every can sold is helping to develop this new market, and every bit of advertising put out by the Hebe Company is helping to educate the people to the greater use of dairy products. This influence cannot help but be of great benefit to the entire industry, for every additional outlet for marketing a product puts a new value on the product, and skimmed milk, prepared and marketed for a human food, is bound to increase in value, thereby benefitting every dairyman.

Every By-Product Should be Utilized

BUSINESS has proved that no industry is completely successful until every by-product has been utilized in the most profitable way. To feed the skimmed milk to stock is not the most profitable method of utilizing this by-product, because only a very small percentage of the food value of the skimmed milk is recovered in the meat of the animal. The larger part is used up by the animal simply in living.

The dairy industry will reach a fuller measure of efficiency and economy when the skimmed milk is disposed of in the most profitable way—as human food. Hebe points the way. It is an ally to the dairy industry, offering one method of utilizing skimmed milk as human food and increasing the use of dairy products in the home.

You will be interested in reading our booklet, "The Missing Third." Ask us to send you a copy. There is no charge for this. Address 2273 Consumers Bldg., Chicago. The Hebe Company, Chicago and Seattle.

Young boars and gilts from the finest blood strains in the country now for sale.

had received from another recently, the breeder who received the boar said, 'I made $25,000 when that boar died.'

"It happened that the retort courteous in this case was, 'Well, you made almost as much as I did when the boar I got from you died,' which shows that neither of these men had very much charity in his heart.

"And while human beings will be human beings as long as the world lasts, this charity business is worth thinking about occasionally anyway."

SHORTHORN BREEDERS SALE

With more than 60 head of royally bred Shorthorns entered, California breed enthusiasts are looking forward with interest to the fourth sale of Shorthorns to be held Wednesday, February 25, at the University Farm, Davis, by the California Shorthorn Breeders Association. A big attendance of farmers newly interested in Shorthorn breeding is expected and it is probable that many of the cattle from the sale will go into the establishment of new herds.

The sale will include consignments from the herds of the Pacheco Cattle Company, Henry M. Elberg, T. T. Miller, the University Farm, Charles A. Trosi, G. A. Murphy, Caledonia Farms, W. M. Carruthers, T. S. Glide, H. L. and E. H. Murphy, the Fair Oaks Ranch and the Blackhawk Ranch.

The Ormondale Company is offering at this sale six bulls and two females, all sired by Golden Goods Jr., sire of Little Sweetheart, grand champion cow at the Chicago International Livestock Show. All but two are out of straight Cruickshank cows. Supt. James McDonnell says that the heifer, Ormondale Viola, is good enough to make another Little Sweetheart. Ormondale Lassie 2nd, the other female offering, is royally bred and is now in calf to Ormondale Radium, son of the grand champion bull, Radium. The bulls are Volumnia's Goods, a splendid individual of which McDonnell says, "He's good enough to head a herd," Star of Ormondale 2nd, whose breeding shows two top crosses of Choice Goods and whose full sister sold at the last sale for $1,175; Maplewood Goods 2nd, Ormondale Archer, Ormondale Baron 2nd, an excellent individual and Ormondale Prince, out of a Ringleader cow tracing to imp. Rose of Sharon.

T. S. Glide, present owner of Little Sweetheart, is consigning one bull, Hillcrest Amaranth, sired by Count Amaranth, winner of first prize at the state fair and at the Los Angeles stock show for get of sire.

Charles A. Trosi, of Vinton, has entered four bulls, three of them sired by Vinton Sultan. These are Ruby's Roanie, by Clara's King out of Elmgrove Ruby; Master Gwendoline, by Master Goods, a son of Clara's King; Gwendoline's Last, by Clara's King out of Gwendoline of Meadowlawn; Starlight, by White Knight out of Roselawn 50th and Prince, by Crescent Dale out of Princess Nonpareil. The best Shorthorn strains in America run through the pedigree of the bull, Gwendoline's Last.

The Pacheco Cattle Company has entered four Truedale bulls, among them a fine two year old and Pacheco Cumberland, by Truesdale out of a Cumberland cow.

One of the strongest consignments of the sale will come from the Caledonia herd and will consist of about 25 bulls and females. A number will be of desirable Scotch families and all are Scotch topped. The bulls are sons and grandsons of Champion of Scotland and Pine Grove King. The females, seven of which sell with calves at foot, will represent a strong collection. Several will sell carrying the service of the noted Caledonia bulls.

SPRING AND SUMMER FASHION CATALOG

A notice of the Cultivator's spring and summer catalog appeared in the issue of February 14, but did not state that this would be sent only on receipt of ten cents in silver or stamps. This catalog shows 550 designs, with helps and directions to the dressmaker, fully illustrated to make easily understood. French seams, fell seams, faced hems, seam binding, couching, fagot stitch, cording, cutting bias folds, etc., are clearly explained and illustrated. It will be found worth far more than ten cents, for it is really a little hand book on sewing.

AUCTION OF
Dairy Bulls

In connection with the meeting of members of cow testing associations and dairymen in general at

University Farm, Davis, Cal.
Friday, February 27, 1920
at 2.30 P.M.

there will be a sale of registered Jersey, Guernsey and Holstein bulls, from some of the best California herds.

JERSEY BULLS have been consigned by Guy H. Miller, Modesto; J. E. Thorp, Lockeford; University Farm, Davis, and Dr. H. W. Hand, Orland.

GUERNSEY BULLS have been consigned by Elliott-Brant Rancho, Owensmouth, and Palo Alto Stock Farm, Palo Alto.

HOLSTEIN BULLS have been consigned by Fred W. Kiesel, Sacramento and other consignments are now under advisement.

It was the opinion of Prof. Gordon H. True, head of the Animal Husbandry Division, that only bulls out of dams with yearly records of 400 pounds butter fat or over should be accepted for this sale and this rule has been substantially complied with.

This is an excellent opportunity to buy a high class, well bred, registered bull of your favorite breed at your own price.

Registered Stallions
at Public
AUCTION

To give stallion buyers an opportunity to secure young California bred stallions at their own price a sale small in numbers but high in quality has been arranged for Stockmen's Week at University Farm, Davis. We believe the credit for the idea is due to Prof. Gordon H. True, head of the Animal Husbandry Division.

It is hoped that this sale will be the beginning of putting the registered draft horse business upon as sound a footing as the registered cattle business is in California, for there seems no logical reason why registered stallions should not be satisfactorily sold at public auction by reputable breeders, when it is taken into consideration that California studs contain high class registered mares and as good stallions as are found anywhere.

For this sale one Shire stallion is consigned by Henry Wheatley, Napa, SALVADOR DRAY BOY, a son of the great show and breeding stallion Desford Banker. University Farm, Davis, consigns the young Shire stallion SEARCHLIGHT, also a son of Desford Banker. M. Bassett, Hanford, consigns the young Percheron stallion HANFORD, whose sire is the International and State Fair winner Ithos, and out of the good mare Kamiche. The sale will be held at

University Farm, Davis, Cal.
Tuesday, Feb. 24, at 4.30 P.M.

Immediately following the sale of registered Hereford cattle.

32 Registered Hereford Bulls
26 Registered Hereford Females
AT PUBLIC AUCTION
Pacific Coast Hereford Breeders
Fourth Public Sale

University Farm, Davis, Cal.

Tuesday, February 24, 1920
at 1 P.M.

The first crop of calves from a pure bred registered HEREFORD bull of correct breeding and type will show increased value in uniformity alone to return the investment in the average range herd, to say nothing of the better fleshing qualities, earlier maturity, and more economical gains that will be their inherited characteristics.

The contributing breeders to this sale will make an offering of bulls fully qualified for range herd improvement, and including a number that may well be rated as registered herd headers.

Fourteen of the twenty-six females in the sale sell with calves at foot by leading western sires, and practically all of the females are in calf to some of the best HEREFORD bulls in present service.

Thus the needs of the breeder, the rangeman, and the buyer of foundation breeding animals have been provided for in this offering with a class of cattle that promise to be safe, sound, profitable investments in the hands of new owners.

"FEEDFINE" FEEDS

are scientifically compounded in proper proportions for dairy and all livestock feeding, of the following ingredients with the most economical results always in view.

YEAST — A concentrate high in PROTEIN and FAT content, sterilized and predigested.

CANE MOLASSES — The richest of feeds in carbohydrates—produces increased appetite on account of its palatableness. Its consumption results in increased energy and it is the best tonic known for animals.

ALFALFA MEAL — Gives body to the ration and supplies the mineral matter which is absolutely essential to all animals.

The greatest known combination for health, strength and productiveness.

So Easy to Put Your Dairy On a Good-Health Basis

To be satisfied with anything less than top-notch health in your cows is a foolish waste of milk-income. Most cow sickness is preventable—or curable. With the aid of KOW-KURE, the great cow medicine, such troubles as Abortion, Retained Afterbirth, Barrenness, Scouring, Bunches and Milk Fever can be eliminated from your herd. KOW-KURE acts on the digestive and genital organs—where nearly all cow diseases originate, and aids nature in inducing normal, healthy action. No dairyman who has used KOW-KURE will be without it. Sold by nearly all druggists and feed dealers; 60c and $1.20 packages. Write for our big free book,

"THE HOME COW DOCTOR."

It is full of facts every dairyman ought to know, and tells just how to treat cow diseases of all kinds.

Dairy Association Co., Lyndonville, Vt.

KOW-KURE

18,458 Pounds Milk

in a year is the record of this fine Guernsey. Records are worth trying for; but health is an absolute essential. Raise the health standard of your cows, and the milk yield will surprise you.

Many Cattle Dying From Loco

Upon his return from a trip of investigation of poisoning from loco on southern Arizona ranges Dr. R. H. Williams, animal husbandman of the college of agriculture, made the following report:

"Widely scattered over southern Arizona loco has been causing a large number of deaths among cattle. Santa Cruz and Cochise Counties are particularly infested. There are various varieties, but one can easily identify the weed for it is the only large green plant found on the desert. In a general way it resembles alfalfa. The plant grows in a small tuft from a large tap root. The leaves are found on opposite sides of the branches in pairs. Most of them grow from six to ten inches high. The leaves are covered with small hairs. The younger ones are narrow and pointed while the older ones are more rounded.

"The animals show very little signs of poison until they consume upwards of 800 pounds of loco. Apparently the best bred stock seem the most susceptible to the disease. Stock maintained in pastures or feed lots are soon attracted to the loco and begin eating it. After a few days, perhaps not more than two weeks, they will begin to froth at the mouth, have a peculiar grunting cough and be short of breath. Cows will frequently abort and gradually grow thin. They soon become weak and walk with a stiff unsteady stride. If driven very far they will fall in a peculiar manner. The hind quarters seem to be paralyzed for the poisoned animals drop down in the loins and the hind legs stiffen out behind them.

"The only way to avoid losses by loco poisoning is to keep the stock from infested areas. Cattlemen are in no position to face heavy losses of animals. It would be better to take the stock off the ranges where loco is prevalent and rent pastures for them or else feed them hay and cake. The stock should be watched closely and as soon as they show signs of the poison they must be gathered in and placed where there is no danger from loco. Stockmen cannot afford to pay ten per cent on money to buy cattle and lose them or the calf crop.

"Locoed animals do not respond well to treatment. Losses may be reduced by feeding stock well and often these animals can be sold at a profit. It is best to discard them because the poison seems to remain over in the animal from year to year, and when a beast eats about 800 pounds of the weed it will die. Thus, if a cow eats 500 pounds this year and 200 pounds next year, the third or fourth year it may be poisoned and perhaps die after consuming about 100 pounds. Cattle that have shown effects of loco poison are seldom good breeders and this is an additional reason for selling them as soon as fat.

"Stockmen must face the loco problem and take active measures to prevent losses. There is no doubt that quite a number of cattle have been poisoned in the southern part of the state. The upper San Carlos and San Pedro Valleys have been worse to date. Overgrazing has injured the natural stand of the grass and allowed loco to flourish. Where only a few loco plants are found on a range it would be a good idea to pull up or spade off the tap root about two inches below the surface. Seed will continue to grow however and the plants they grow should be cut off as soon as they are found. With a little expense one can control the growth of loco where it is not very thick. Fortunately only three of the locoes have been proved to be poisonous, and there are 50 or more species of them. It seems useless to spend one's time to eradicate the harmless locoes."

Potassium Iodide in Malnutrition of Pigs

The state department of agriculture reports that early last fall the owner of a herd of hogs in the foothill district of the Sacramento Valley reported a disease among his suckling pigs, which he described as follows:

When about three days old scalded areas appeared on the face of the pigs around the mouth and ears. These did not penetrate the skin nor resemble the lesions of necro-bacillosis. There was a distinctly noticeable enlargement in the regions of the thyroids. While retaining a good appetite they became emaciated, the skin developed a scurvy-like surface, was wrinkled all over the body and was hard to the touch. These symptoms progressed with increasing weakness, until the pigs finally lay on their sides unable to rise and died in the course of a couple of days more.

About 50 pigs, all belonging to six sows that had farrowed at about the same time, were affected, without an exception. The course of the disease appeared to be from two to six weeks. The mothers remained healthy, as did all other hogs of various ages on the place.

The condition suggested some form of malnutrition and called to mind the article by E. B. Hart and N. Steenbock of the Wisconsin Laboratory of Agricultural Chemistry on thyroid hyperplasia and the relation of iodine to the hairless pig malady, in the Journal of Biological Chemistry, February, 1919, and a succeeding article in the Journal of American Veterinary Medical Association by Howard Welsh of Bozeman, Montana, in which he stated that iodine is a specific cure for birth of hairless pigs and goitre in lambs and calves.

Accordingly it was advised that about two grams of potassium iodide be dissolved in water and mixed with mash and fed to the sows and litters daily.

The owner reported that 21 head were lost until the time of treatment, when almost immediate improvement was noticed and continued until the situation was entirely cleared up.

Cholera Not Only Disease Fatal to Hogs

For many years cholera has been the most serious disease of hogs in this country. In fact, many authorities felt that it was the only widespread epidemic among these animals of any considerable importance. According to Dr. I. E. Newsom, veterinary pathologist for the Colorado agricultural college, more careful diagnosis has shown that with the control of cholera other diseases are manifesting themselves and are shown to have considerable economic importance. The most prevalent diseases among hogs, not cholera, appears to be swine plague, whose symptoms and post mortem changes are very similar to the first named disease. However, the administration of hog cholera serum is of little value in the control of this malady. The disease is more apt to affect small pigs, where it may appear as a pneumonia. However, in some instances it does affect older animals. Vaccination against swine plague has proven fairly satisfactory, but is not on as firm a foundation as vaccination against cholera.

Deep curretting of ulcer of the mouth, with an addition of a strong antiseptic, has been found advisable. Careful differential diagnosis, therefore, is quite essential to any treatment of hogs suffering from disease, and it is quite important first to determine the nature of the malady before any treatment is instituted.

MAY SPREAD TUBERCULOSIS

Warning against the feeding of diseased cattle carcasses to hogs is sounded by the United States department of agriculture. A conference of state and federal officials, held early in October to deal with matters of tuberculosis eradication, brought to light numerous instances where hogs contracted tuberculosis after feeding on carcasses of tuberculous cattle. one case nearly an entire drove of hogs shows lesions of tuberculosis, which at first the owner could not account for. Later he admitted to the veterinarian investigating the case that several months before he had fed to the hogs the carcass of a cow that "never did very well."

The bureau of animal industry urges livestock owners to have a careful autopsy made on animals dying on the farm or killed because of sickness, in order that the definite cause of trouble may be learned. Carcasses that show lesions of infectious diseases should not be fed. Instead, such carcasses should be cared for so that no part can be eaten by hogs. Thorough destruction of the carcass by burning, or by deep burial under a liberal application of quicklime, is the proper procedure in such cases. Attention is called also to the danger of feeding offal from slaughtered animals to swine, as such a practice is another source of infection.

MINERAL REQUIREMENTS OF SWINE

Studies made by the department of nutrition at the Ohio experiment station show that all grain rations for growing swine require mineral supplements. The breaking down of swine and the development of rickety symptoms, lameness and paralysis have been found to result from insufficient mineral nutriment.

Rations containing sufficient milk or tankage or leguminous roughage, however, do not require mineral supplements. When swine are fed on cereal rations there is urgent need for the element calcium and possible need for phosphorus in addition. These may be efficiently supplied by a half and half mixture of precipitated calcium carbonate and precipitated bone flour. Other less efficient carbonates and phosphates are available.

Mixing the mineral nutrients with the ration and allowing free access to mineral supplements as well, will tend to increase the development of the skeleton with swine intended for breeding purposes. When swine are self fed there is a tendency to put on more flesh than skeleton to correspond, unless mineral supplements are fed mixed with the grain.

TEN RULES FOR LIVESTOCK MEN

Here are ten good rules for livestock breeders vouched for by the animal husbandry men at the New York state college of agriculture at Ithaca:

Be honest.

Choose a breed and stick to it.

Breed with the correct type in mind.

Study pedigrees for inherited characteristics, relative merit and value.

Keep your herd or flock free from disease.

Develop the young animals and maintain the breeding animals through wise feeding and management.

Boost better livestock in your community.

Advertise judiciously.

Exhibit at the county, state and other livestock shows.

Remember that a satisfied purchaser is your best advertisement. So be prompt in registering and transferring animals and make good all guarantees.

EXERCISE AND FOOD FOR BROOD SOW

The brood sow needs a variety in her food and exercise. In experiments conducted at the North Dakota agricultural college, under the direction of Prof. Shepperd, it was found that sows will readily eat alfalfa hay, and that when this is fed with a mixture of about half barley and half shorts at the rate of two and one-half pounds daily for a 200 pound sow, splendid results have been secured. Equal parts of barley, oats and bran or shorts also makes a very good feed. Exercise is also very important. It was found that the best way to give the grain feed was to sweep the floor clean and scatter the grain feed on it. This results in the sows spending hours on their feet getting their feed. Observations indicate that sows fed a variety of foods and given plenty of exercise, are not likely to produce hairless pigs.

POULTRY

OUR SPECIALTY
GUARANTEED TRAP NESTED
S. C. WHITE LEGHORNS

We have 128 females with records from 200 to 296 eggs during 12 months pullet year. Place your egg order now. All orders booked and filled in rotation. We have three grades, as follows, from which only one setting per week will be sold: 235 to 284 egg record $15.00 per 15; 220 to 235 egg record $10.00 per 15; 200 to 220 egg record $5.00 per 15. We guarantee 90 per cent fertility and suggest they be hatched by hens. Each egg will be marked with number of hen and number of eggs laid during pullet year. All these hens are mated to cockerels, sons of hens with records from 278 to 296 eggs. Baby chicks all sold. ENGLAND'S EGG RANCH, the home of "ACTUALLY" trap nested S. C. White Leghorns every day in the year since 1912. Box B-337, Inglewood, California.

If You Want to sell or exchange your property write me. John J. Black, 116th St., Chippewa Falls, Wisconsin.

WANTED

Field Man Wanted for weekly farm publication having large California circulation, to travel throughout state, gathering livestock field notes and reporting interesting livestock events; also securing advertisements of livestock, poultry, etc. Must be competent writer on livestock and kindred subjects. To the right party we can offer permanent position. Salary and traveling expenses paid. In answering, state age, previous employment, references and salary expected. F. & T. Sect., California Cultivator, Los Angeles.

Wanted—By San Francisco firm, competent salesman to sell a well known brand of semi-solid buttermilk through California, with headquarters at San Francisco. State salary expected and experience with this class of merchandise. Answer Box "D," California Cultivator, 112 Market Street, San Francisco, California.

Wanted—Men with rigs preferred, all or part time, taking orders among farmers for an old reliable California Company. Good pay and several weeks' work. ADDRESS: J. H. Yetter, 115 North Broadway, Los Angeles (upstairs).

N. M. GRAHN
Manager Duroc-Jerseys at Ireland Ranch for 4½ years, with experience in selection, general management and show ring, is open for new location. Address Owensmouth, California.

Men With Spare Time, ranchers especially, can find excellent renumerative proposition, salary guarantee, working for an old reliable California Company. Turn your spare time into cash. Write J. H. Yetter, 115 North Broadway, Los Angeles.

Man With Years of Experience desires position on ranch as cook; steady; best references. Oscar George, Bellflower.

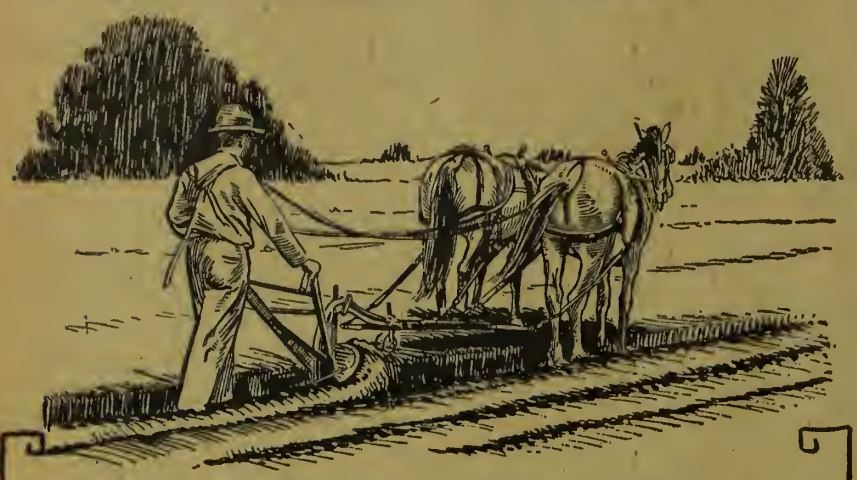
Wanted—To buy cattle, 75 or 100 steers preferred; will take good stock cattle. Address P. Herlick, Helendale, California.

FOR LEASE

Dairy Ranch For Lease—50 acres alfalfa, 50 acres barley land, 100 inches water. Complete equipment, 63 head feed carriers, litter carriers, electric motors, milking machines, boilers, brine circulators. J. E. Mayberry, Los Nietos.

Orange County's sealer of weights and measures has discovered as high as ten pounds of soil in a sack of potatoes.

A MONEY SAVING GUARANTEE--



MOLINE CHILLED PLOWS

The Moline Plow Company is the only manufacturer of Chilled Plows that guarantees Chilled Plow Moldboards against breakage in actual field use, while at the same time guaranteeing them to properly fit and to have a deep chilled wearing face as hard as the hardest of chilled moldboards.

The Moline Line of Implements
Plows (steel and chilled)
Harrows
Planters
Cultivators
Grain Drills
Lime Sowers
Mowers
Hay Rakes
Hay Loaders
Hay Stackers
Grain Binders
Corn Binders
Pitless Scales
Spreaders
Wagons
Moline-Universal Tractors
Stephens Salient Six Automobiles

A guarantee means nothing if it does not give the advantages which it sets forth. Moline Chilled Plows give the users the best possible value when they buy and afterwards save the expense of repairs due to breakage. The hard surfaces on Moline Chilled Plows resist the wear of gritty soils and the gray iron backs do not break.

The Moline Line offers a chilled plow for every plowing requirement and every plow is light in draft, easily handled and does excellent work.

See your Moline Dealer about getting a Moline Plow now or write us for full information.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Abandoning Homestead

Does the filing of the declaration of joint homestead by husband and wife have any effect upon the sale of property in case both desire to make such sale?—Subscriber, Chula Vista.

A homestead can be abandoned by a declaration of abandonment or a grant executed and acknowledged by husband and wife, so that either a grant deed of the property signed by both husband and wife, or a declaration of abandonment will clear the property of the homestead. Such deed, would of course be in the same form as if no homestead was upon the property.

Wife's Property Rights

My husband owned ten acres of land before marriage. In case of his death would I have my share in the property or would it go to his children by a former marriage? Since our marriage we have purchased 15 acres. The ten acres mentioned above was mortgaged to purchase the 15 and I was required to sign the mortgage. Does my signature on the mortgage give me any rights in the ten acres owned by my husband? For the 15 acres we have a joint deed. In case of my husband's death to whom would this property go? To whom does this property last mentioned go in case of my death?—Subscriber, Santa Ana.

The ten acres is the separate property of the husband, of which he may dispose by will without regard to any interest of the wife. If he should die without will, however, there being more than one child, the wife would succeed to an undivided one-third. As to the signature upon the mortgage, the actual signature was to the note for the borrowing of money, which money went into the purchase of the 15 acres, which is clearly community property. The fact of the wife's signature as to the mortgage upon the first mentioned property would have no effect. If the deed to the 15 acres is in fact a deed of joint tenancy with the right of survivorship, then upon the death of either husband or wife, the whole of the property would go to the survivor. It is not however, a joint deed if it is merely made in the names of the two parties. In such instances it conveys a tenancy in common so that each would have an undivided one-half interest, in which event and in default of any will, under an administration of the estate of the deceased party, it would descend to the heirs according to law. In case of community property, upon the death of the husband the wife would be entitled to one-half and to one-third of the remaining one-half, the children being entitled to the two-thirds of the other remaining half. In the case of the death of the wife without issue, as in this case, the husband would be entitled to one-half; the remaining half going to the next of kin of the wife.

Damages for Collision

A owns land on each side of the state highway, which he uses for pasture. By some means one of the animals which he pastures is on the highway after night. B drives along the highway in his auto and runs into the animal, causing a bad wreck. It is necessary to kill the animal, and the machine is wrecked badly. Who is liable and who can collect damages?—Subscriber, Tulare.

Subdivision Y of Section 20 of the motor vehicle act as amended in 1919 provides that no person owning or controlling the possession of any horse, cow, mule, ass, sheep, goat, hog, or other livestock shall voluntarily or negligently permit such animal to stray upon, or remain unaccompanied by a herder or other person in charge or control thereof upon a public highway, either side of which is adjoined by property which is separated from such highway by a fence, wall, hedge, sidewalk, curb, lawn or building, or shall permit the tether or any portion thereof to which said animal may be attached to lie across or upon any public highway, and no person shall feed, pasture or camp any such livestock upon any public highway between the hours of sunset and sunrise without keeping a sufficient number of herders on continual duty to keep open the road so as to admit at all times of the ready passage of vehicles, and also keeping red lanterns or lights burning to warn the public of the presence of such stock. It would therefore seem that if it may be proven that the party pasturing the animal negligently permitted the animal to stray upon the highway, that he is liable for the damages which the driver of the automobile suffered by reason of the collision.

RAISING RABBITS

A bit of rabbit meat is fine for the table now and then and, more, there is a tidy profit to the California boy or girl who will care for a few on the side, before and after school.

A writer in Successful Farming gives the following suggestions:

The raising of rabbits for profit has become widely spread in both Europe and this country, as the flesh is preferred by some people to chicken. Many varieties are grown for pleasure and for shows, but the fancier who wants to realize the biggest profit from his labor should choose the rabbit which can thrive with the least attention.

For the beginner, one buck and two does are sufficient. The hutches should be made light enough so that they may be moved about. Thus, when the ground becomes sour under a hutch, as it is bound to do, it may be moved to another spot, and the ground given a chance to dry out. By moving the hutches about a comfortable location may be secured for either summer or winter.

The buck's hutch may be as small as two feet by two and one-half feet, and two feet high, but it is better to give him a little more room. The average doe will bring from seven to ten rabbits in a litter, while an extra fine one will bring fifteen; so the hutch should be at least four feet square. A hutch containing about this amount of floor space, but made long and narrow gives more room for exercise.

The hutches must be placed on board floors or the rabbits will give continual trouble by burrowing out, and they do not seem to mind the hard floors. The sides should be made of one inch mesh wire netting, or even smaller, for larger mesh netting will allow the young rabbits to escape, and fall a prey to dogs and cats. A hutch facing the east, with one side covered with netting and the other three with boards is the most satisfactory for all kinds of weather. A waterproof cover should be provided, as it is very injurious to the health of rabbits to force them to live in damp hutches. The doe's hutch should have a darkened box for young rabbits a common apple box, with an opening large enough for the doe to pass through, does very well, when turned upside down. The hutch must be cleaned and filled with dry straw or other litter at least once a week, or sickness will result.

It does no harm to leave the young rabbits with the doe until she weans them of her own accord; but as some does will not wean them soon enough, they may be taken away when four weeks old, except in cold weather, when they should be left a little longer. Four litters a year is enough for the average doe. It is best to wait until the does are from six to eight

months old before mating, as they then have gotten their growth. When it is not possible to make small hutches for all the rabbits, a large pen made with netting on all four sides is very convenient for the young ones. Twelve inch boards may be buried nearly their whole depth in the ground, and, as this will keep the rabbits from burrowing out, no floor will be needed. The rabbits may run together until they are about three months of age, when those of different sex should be placed in different pens.

In summer when green feed is plentiful, the rabbits may be fed on this entirely, although they enjoy a little hay or other dry feed occasionally. They will eat almost anything in the plant line which is juicy. Nearly all scraps from the kitchen may be fed to them, and they are especially fond of cabbage and carrots. When green feed is not available, and the rabbits must be fed on hay, they should have a few vegetables such as beets, turnips and carrots. This gives a change and also a balanced ration. They must have plenty of water to drink at all times, and especially the does with young, as at this time they have an almost unquenchable thirst, and this must be satisfied. These does enjoy a little bread and milk, as do the little ones as soon as they will eat it. When the doe has an especially large litter, both she and the young ones should have this feed regularly. Rabbits may be fattened on almost any grain, but corn is probably the best.

By using a little judgment in feeding, and giving the rabbits clean, dry quarters, one may avoid nearly all sickness, and get a great deal of pleasure, as well as profit out of rabbit raising.

ENCOURAGING FEDERAL ROADS

A question of interest in highway legislation before the present session of congress is the Townsend bill, providing for a national highway commission, a national highway system, and national construction and maintenance of this system. This bill was introduced in the senate just before the holiday recess.

The important points covered by it are enumerated in a statement approved by Senator Townsend as follows:

"Authorizes the construction and maintenance of a national system of highways exclusively at the expense of the national government.

"Creates a federal highway commission to be named by the president with the advice and consent of the senate to take over all the highway functions now exercised by the department of agriculture and to construct and maintain a national highway system. This commission is to consist of five men selected with due regard for geographical representation.

"The national highways shall consist of two main highways in every state, comprising one per cent of the total highway mileage of each state as ascertained by the commission, where one per cent is not sufficient to cause these highways to connect with adjacent states, bordering countries, waterways, the commission is authorized to extend the mileage in that amount.

"The commission is directed to consult the state highway departments as to locations of those highways and is further authorized to have all the work undertaken by the state highway department, supervisory power remaining with the commission.

"In those states where national highways have been constructed to a point deemed adequate for present and future traffic needs by the commission, the commission is authorized to construct an equivalent mileage to that taken over, but maintenance in those cases will rest with the state.

"For the purpose of carrying out the act there is appropriated $50,000,000 which shall become immediately available; $75,000,000 for the fiscal year beginning July 1, 1920, and $100,000,000 for each of the three succeeding years, in all $425,000,000.

"After making such deductions as may be necessary for administration and maintenance, the commission is directed to allocate the remaining funds between the several states annually in the same ratio that the mileage in each state bears to the total mileage selected in all states."

SUBIRRIGATION WITH AND WITHOUT TILE

As generally understood one of the chief objections to subirrigation is the slowness of penetration of water through the lower soil from the underground channels provided. This is especially to be noticed in heavy soils. Another objection is that the water always rises and carries upward any alkali that is present in the lower soil.

The service that can be given by proper soil blasting in this connection can hardly be overestimated. When the water is carried in pipes the ground between the lines can be broken up, fined and eventually granulated through proper blasting so that capillary movement of the water will be very rapid. Saturation can be obtained in such broken ground in a fraction of the time required in ordinary compact subsoil.

The second objection mentioned brings up the fact that when the soil is open as blasing leaves it, no pipes are necessary for subirrigation. The water can be turned on in sufficient amounts to saturate the soil but not to cover the surface, and it will filter through wide blocks in a short time. When this is done, the movement of water is sideways and downward, and there is no bringing upward of alkali from lower levels.

If former irrigation has caused water compacting to the extent of interfering with its distribution, blasting will correct the trouble and at the same time insure both drainage and moisture storage. The length of time this loosening will remain effective depends entirely on the crops grown and the surface cultivation. Plenty of organic matter from roots and from cover crops turned under will keep the subsoil open for years and will insure a large and continual drawing on the virgin fertility of the soil that normally is insoluble.—J. J.

FARMERS NEEDED AT INDIAN SCHOOLS

The United States civil service commission announces that Indian schools in many states are in need of farmers to have charge, under the direction of the superintendents, of agricultural operations on farms connected with the schools, to give instruction in practical farming, and to do extension and instructional work in agriculture among adult Indians occupying their own farms on reservations.

Information and application blanks may be obtained from the secretary of the United States Civil Service Board at San Francisco, or from the United States Civil Service Commission, Washington, D. C.

GROUND WATERS OF SAN DIEGO

The United States geological survey has issued "Water Supply Paper 446, Geology and Ground Waters of Western San Diego County," by Arthur J. Ellis and Chas. H. Lee, in cooperation with the department of engineering of the state of California and of the city of San Diego. Those interested in San Diego irrigation will find this volume extremely valuable.

The superintendent of documents will furnish the book, which has a portfolio of maps of portions of the county, for $1.

The work of the farm bureaus in stimulating swine production by means of pig clubs and community auction markets has brought about considerable improvement in quality and prices, and doubtless is the principal reason for the great increase in number.

HUDSON SUPER SIX

Endurance Makes Hudson the Largest Selling Fine Car

More Than 80,000 Owners Value That Quality Most Because It Means Long Dependable Service, Free of Car Troubles

Hudson outsells all the world's fine cars, only because of qualities that count in every day service.

Chief of these is durability. All motorists so regard it.

And endurance is written everywhere in Hudson history.

Since Hudson made its unrivalled endurance records, it has led all other fine cars in sales every month and every year.

That proves how experienced motorists judge car worth.

How Hudson Gained Leadership

It was not speed that gave it sales leadership; though Hudson holds more stock car speed records than any car, and with cars embodying the Super-Six principle won more points in speedway racing than the fastest special racers ever built.

It was not power; though Hudson holds the fastest time ever made up Pike's Peak, in the classic of all hill climbs.

These Qualities Inspire Pride In Hudsons

They are valued of course by more than 80,000 Hudson owners. They contribute to the rounded supremacy of performance which distinguishes the Hudson everywhere. And it is natural to feel pride of ownership, and affection for a car that none can rival in fleetness, or in hill-climbing.

But few will ever care to use the full limit of Hudson speed. Few will meet hills to test its limits of power.

What does count every day of use is sure, dependable transportation. What does count after many months of service is the way Hudson retains its smooth, silent powers of superior performance, undiminished.

It means the assurance and reliance in your car that you feel in a watch that has served you for years, and never gave you cause for doubt. You are not disturbed by speculation regarding probable car troubles. Because with Hudson, car troubles are not thought of because of their remoteness.

And remember that the Super-Six principle which accounts for all Hudson's speed, endurance and performance records, is exclusive in the Hudson. No other maker can use it. For the Super-Six motor, which adds 72% to Hudson power, without added weight or size, was invented and patented by the Hudson.

Mark How Hudson Now Fulfills Its Prophecy

Every year has seen some improvement in the Hudson. The new models approach nearer the builders' ideal than they ever believed practicable. It is today a finer machine than those early models, which made performance records, no other car has equalled.

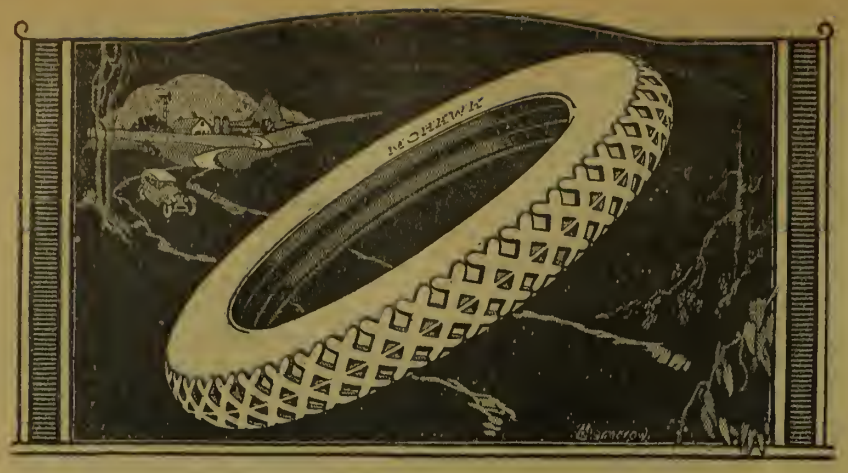
Hudson also leads in style. Its influence shapes motor design each year.

Demand for such advantages as Hudson's inevitably means that immediate delivery is not possible for all who want them. Many have waited months for the model of their choice.

Even should you not want your Hudson until next year, now is not too early to place your order.

Hudson Motor Car Company, Detroit, Mich.

(3014)



"Quality Always Satisfies Me"

That's the reason one farm-owner recently gave for his consistent year-in and year-out loyalty to Mohawk Quality Tires.

"If honest quality is the basis of the seeds, the shoes, the tractor, the automobile, the tire or anything else I buy—I know I'm going to be satisfied with my purchase," he stated. "That's why I knew Mohawks would satisfy and that's why they have—they are quality tires through and through."

In seven years the Mohawk policy of building a strictly quality tire has not deviated for a day, an hour, a minute.

In all this time not a single ounce of quality-reducing "fillers," such as rosin, glue, whiting, clay, etc., has ever found its way into a single Mohawk.

Purest rubber—strongest fabric—only these are used in Mohawks—and an extra ply of fabric goes into most sizes of the fabric tires.

In addition to pure materials—Mohawks are strictly hand-made by tire builders who are the choice of the industry.

That this consistent quality is best in the long run is evidenced today not only by the tremendous and steadily increasing number of Mohawk users—but by the fact, proved by records, that 85% of those who buy their first Mohawks continue to use Mohawks exclusively.

All standard sizes in both Cord and Fabric tires—ribbed or non-skid treads—and an extra ply, hand-made Ford size, also.

GRAIN

Wheat: The prices are based upon federal grades and standards at the terminals in San Francisco Bay and Los Angeles, and are as follows, per bushel of 60 pounds:

Hard White—	Per Bushel	Per Cental
No. 1	$2.20	$3.66 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.18	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.09	3.48½

The above are minimum prices.
For sacked grain add 4½ cents per bushel of 60 pounds to above prices. Deductions of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.25@3.30; black, 3.00.
Corn: California yellow, 3.15@3.25 per cental; Egyptian white, 3.75@3.80; milo maize, 3.15@3.25.

Barley: Spot feed, per cental, 3.50@3.60; brewing, 3.65@3.75.

HAY

Under date of February 14, Scott-Magner & Miller says:
Receipts past week, 815 tons. Market here has been extremely quiet, all purchasers confining themselves to bare necessities; extreme high prices have been a bar to any general trading. The traders here base their calculations on the prospect that a continued dry spell will hold up and perhaps raise prices, while good copious rains and growing conditions in the country would undoubtedly weaken the market. The demand throughout the country has continued strong and the lack of feed for stock on the ranges and even in the best domestic pasture land has created a demand all over the state. This has diverted much of the usual tonnage that ordinarily comes to San Francisco at this time of the season. Fortunately the railroad situation is normal and very good transportation service has supplied all country requirements. Export has been very light during the past week, very little either going to private purchases or to the government. Alfalfa continues in strong demand, chiefly through the country sections, although the ordinary and moderate grades of hay are being bought to take its place wherever possible. Straw continues as formerly with practically no demand and prices nominal.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses are to be added according to conditions:

Fancy Wheat Hay light 5 wire bales	30.00@32.00
No. 1 Wheat or Wheat and Oat Hay	27.00@31.00
No. 2 Wheat or Wheat and Oat Hay	26.00@28.00
Choice Tame Oat Hay	26.00@29.00
Other Tame Oat Hay	26.00@29.00
Wild Oat Hay	25.00@28.00
Barley Hay	25.00@28.00
Alfalfa Hay	27.00@32.00
Stock Hay	22.00@25.00
No. 1 Barley Straw, per bale	.50@ .80

Citrus Markets

Los Angeles, February 18, 1920.
All oranges are higher and general market conditions better except for blizzard weather which is preventing general movement. It now appears that earlier estimates were materially too high, and it is now estimated that there are some 2,000 or 3,000 cars of Navels less to ship than last year this date. Fruit now running to large sizes.
F. o. b. quotations are around $5 and $6 on lemons but some spectacular sales are being made in the East especially in the auction between $10 and $12. Weather conditions for moving fruit during the last week have been very unsatisfactory.
Shipments
Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 6,859 cars; lemons, 1,559; total, 8,418. To same date last season: Oranges, 6,105; lemons, 2,020; total, 8,125. From Central California this season: Oranges, 3,441; lemons, 206; total, 3,647. To same date last season: Oranges, 2,222; lemons, 233; total, 2,455. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

International Dehydrator

operates closed—making its own drying atmosphere; not dependent on outside conditions.

Plant Operated by Beales-Kimball Fruit Co., Van Nuys, California.

We Want You to Raise CAVIES for US

In order to supply our ever increasing demand for cavies (guinea pigs) for use in hospitals, laboratories, etc., we have opened a California branch. Few industries offer such profit at such slight investment of money and time. Foundation stock can be purchased for only a few dollars and cost of raising is only about 5 cents per head. We agree in writing to purchase all the cavies you raise from stock purchased from us or their descendants and will pay $1.20 a pair for animals weighing over 8 ounces delivered. Even a few pens should pay you well. Send for booklet about breeding, care and money making opportunities raising cavies. Mailed for 10 cents to cover cost and postage. You can get started raising cavies on an investment as low as $5.00.

State Beekeepers Meet

By Ernest Braunton

EMERSON said: "There are more than 5,000 beekeepers in this state and they should be more fully represented than this small delegation of 200. We must bestir ourselves to interest as many as possible in the benefits t be derived from membership in our organization." This was George Emerson, of the host city, speaking before the 31st annual convention of the State Beekeepers Association, at Exposition Park, Los Angeles, February 6-7, 1920.

But what they lacked in numbers they made up in enthusiasm and proved a most learned and facetious lot, talking glibly on such ordinary topics of conversation as the "supersedure impulse" of the hive. Cary W. Hartman put the audience in a merry mood in his brief response. He was introduced as the bee inspector of Alameda County. He said: "I want you to understand that I am president of the Alameda County Beekeepers Association; the inspectorship will be explained later. I am the second largest owner of bees in the county, having 100 colonies. The high man has 107. The others have all the way from the one they expect to catch up to 40 or 50. When we organized my son said the name was too cumbersome, that if we had such a long name it should be chosen with a view to using the initials for a short title, and suggested the Benevolent Order of Beekeepers Societies—B. O. O. B. S. The county supervisors created the position of inspector and a committee was appointed to find a young man full of pep and well versed in beekeeping. It reported back that no competent person could be found who would accept the place at the salary offered and that anyone who would work for such salary would be of little use. That's how I got the second job."

President Whiteside was asked what was the record for the amount of honey ever taken from one colony with one queen in one season. He stated he did not know. But he had taken 500 pounds from some of his. George Emerson said that in 1884 that part of Los Angeles County now Orange County had an association that kept records from every colony, and the total output averaged 700 pounds of extracted honey to a colony. Someone stated that a man in Arizona has a colony which last year yielded 935 pounds. The president then remarked that as the first one who told a story in that crowd stood no earthly show it was a good time to stop.

Serious discussion brought out the fact that if the colony was a strong one constant removal of filled combs and replacement with empties, coupled with a roomy hive, were important factors in honey production.

The Man From Ohio

M. E. Pritchard, chief queen breeder of A. I. Root Co., Medina, Ohio, then spoke on "Queen Rearing." He said the chiefest of favorable conditions in queen rearing was temperature and that 97 degrees should be steadily maintained day and night. Incubators had been used for experiment and it was found that a variance of one or two degrees from 97 worked harm by retardation or acceleration of development in the queens. He keeps strong colonies in warm hives with four inch packed walls. The season for queen rearing in Ohio lasts but 120 days. Feeding for queens must be heavy and continuous, not so much in volume as replenishment. For that reason he feeds the bees every 12 hours. This is necessary for after the bee's working day is over everything stops in the hive, absolutely nothing but sleep goes on. When a worker comes in laden he gets rid of his load as quickly as possible and in any way he can. It costs two and a half pounds of sugar to rear each queen. Every beekeeper should rear his own queens if he knows and practices the best methods, otherwise he should buy. After the beginner has bought two or three or more tested queens he should use them as long as he can in preference to their offspring. In answer to a question from one who had 100 colonies he said he would use the Dr. Miller method of cutting out the brood comb and putting in queen cells. When the young queens were about to hatch the old queens should be killed. Another question brought the statement that mother and one daughter might be in the hive together, but two or three daughters, never. All larvae are fed the same for 40 hours, after which the food of the worker larva is changed and the queens are fed differently. If temperature and food were kept to the highest standard all workers might be queens. From this it is evident that bees are more successful in restricting their royal family than are human beings.

Other Speakers

L. L. Andrews of Corona, in a summary of the university short course on beekeeping was the first speaker. A mixture of business and discussion followed, a new constitution being adopted by unanimous vote. In case of foul brood President Whiteside said he shook his bees down in a bee tight honey house, boiling all frames, etc., for three-fourths of an hour. An effort will be made to register all beekeepers with the supervisors of each county, with number of colonies owned by each and nearly all would keep out transient apiaries to protect the land owning apiarist. An agreement in some counties keeps the plants at least two miles apart. Eucalptus flowers often produce dysentery in bees when they are first available. While some counties have no bee inspector the state law declares "that upon petition of ten beekeepers the county supervisors shall appoint," no alternative being given, and that the salary of said inspector shall be $4 a day. It was ventured that a state inspector should be appointed so that county lines could be eliminated in rulings for the good of all, but bees should be kept from coming into the state in hives or in other ways than in one pound packages.

Five thousand colonies were brought into California last year just for the feeding season. One firm brought 4,000 colonies into Riverside County and placed them without regard to existing apiaries. This is manifestly unfair to land owning beekeepers and should be prohibited by law. Discussion brought out the accepted statement that in orange growing districts 40 pounds of orange honey to a colony is a good average seasonal yield.

A committee on permanent exhibit was appointed, consisting of C. A. Schrim, 201 North Avenue 18, Los Angeles, chairman; L. L. Andrews, Riverside County, and J. G. Gilstrap, Siskiyou County. The exhibit is to be installed in the state building, Los Angeles. An observation hive and pure honeys will be the chief features. Mr. Schirm says if volunteer exhibits are shipped to him he will pay charges and place same with exhibitors name thereon. Only pure honeys will be shown and samples are desired of such in orange, buckwheat, eucalyptus, and every sort of which the sender is certain as to its purity. The new officers elected were: President, J. E. Pleasants, Orange; vice president, M. H. Mendleson, Piru, Ventura County. A. B. Shaffner was reelected secretary-treasurer.

Item No. V-102. ESCORT WAGONS. 2,000.
Weight, 2140 lbs. Capacity 5000 lbs. Wheels, front 3 ft. 8 in. high, rear, 4 ft. 6 in. high; tires, 3 in. x ⅝ in. round edge, steel or iron; track, 5 ft. 1½ in. Body, size about 10 ft. x 40 in. x 27 in., painted olive drab, 3 coats. Stored at Jeffersonville, Ind. Farmers wagons, Freighting and Road Building. Minimum bid considered, 1 wagon. For inspection apply, Z. S. O., Jeffersonville, Ind.

Item No. V-111. ESCORT WAGONS, 107.
Same as above. Stored at Camp Sevier, S. C. For inspection apply, Z. S. O., Transportation Bldg., Atlanta, Ga.

Item No. V-103. MEDICAL CARTS, 1.
Weight 1144 lbs. Capacity 1500 lbs. Body, 7 ft. 8 in. long, 4 ft. 4 in. wide, 20 in. deep; wheels, Archibald or artillery type. 4 ft. 6 in. high; tires 3 in. x ⅝ in., oval edge, steel or iron. Track, 5 ft. 1½ in. Painted Olive Drab. 3 coats. Stored at Washington, D. C. Hauling of all kinds. Minimum bid considered, 1 cart. For inspection apply Z. S. O., 17th and F Sts., N. W., Washington, D. C.

Item No. V-104, MEDICAL CARTS, 2.
Same as above.

Item No. V-106. DRINKING CART, 1
Weight, 1255 lbs. Capacity, 1500 lbs. Tank, galvanized sheet steel, 150 gal. capacity. Pump, double acting hand lever, 5 in. cylinder, Gould patent force pump. Wheels, Arcbibald or artillery type, 4 ft. 6 in. high, tires 3 in x ⅝ in., oval edge. Track, 5 ft. 1½ in. Painted Olive Drab, 3 coats. Stored at Washington, D. C. Sprinkling and tree spraying. Minimum bid consider, 1 cart. For inspection apply, Z. S. O., 17th and F Sts., N. W., Washington, D. C.

Item No. V-107. DRINKING CARTS, 60
Same as above. Stored at Chicago, Ill. For inspection apply Z. S. O., 1819 W. 39th St., Chicago, Ill.

Item No. V-108. BUCKBOARDS, 99
Capacity, 4 or 6 persons and baggage, weight, 740 lbs. Body 8 ft. 3 in. long, 3 ft. wide. Wheels, front, 3 ft. 6 in. high, rear, 4 ft. high. Tires, 1¼ in. x ⅝ in. steel; track, 5 ft. Painted Olive Drab. Stored at Jeffersonville, Ind. Minimum bid considered, 1 wagon. For inspection apply, Z. S. O., Jeffersonville, Ind.

Item No. V-109. BUCKBOARDS, 143
Same as above. Stored at Atlanta, Ga. For inspection apply, Z, S. O., Transportation Bldg., Atlanta, Ga.

Item No. V-122. HAND CARTS, 270
Weight, about 173 lbs. Capacity, about 600 lbs. Wheels, "A" grade, 7 flange, 16 spoke. Tires, steel, sq. edge, 1½x3-16 in. Truck, 3 ft. 7 in. Body, 4 ft. 6 in. long, 2 ft. 9 in. wide, 13½ in. deep. Painted Olive Drab. Stored at Chicago, Ill. Minimum bid considered, 1 cart. For inspection apply, Z. S. O., 1819 W. 39th St., Chicago, Ill.

Item No. V-123, AMBULANCE WATER TANKS, 9
Length, 15⅛ in., dia., 10½ in., provided with faucets. Made of galvanized iron with all joints thoroughly soldered. Stored at Baltimore, Md. Minimum bid considered, 9 tanks. For inspection apply Z. S. O., Coca Cola Bldg., Baltimore, Maryland.

Axles and Wheels, (front and rear), Spokes, Rims and Singletrees for Escort Wagons, are also offered in large and small quantities. Full details from any of the Zone Supply Offices here listed.

CONDITIONS OF SALE

Goods are sold "as is," f. o. b. point of storage, wbere they may be inspected. Permits to inspect must be obtained from the office given under each item. BIDS MUST BE BASED ON THE BIDDING UNIT SHOWN FOR EACH ITEM. Specify the ITEM NUMBER OF EACH ITEM on which bids are made. NO SPECIAL FORM OF BID IS NECESSARY. Bids may be madè by letter or telegram. No deposit required. Upon receipt of notification by mail, successful bidders must deposit a certified check for 10 per cent. of the amount of the purcbase price. All materials purchased must be removed and paid for in full witbin 30 days of date of notification of award.

Address your bids to "Zone Supply Officer," at the nearest of the following offices: Army Supply Base, Boston, Mass.; 461 8th Ave., New York City; 21st St. and Oregon Ave., Philadelphia, Pa.; Coca Cola Bldg., Baltimore, Md.; Transportation Bldg., Atlanta, Ga.; Army Bldg., 15tb and Dodge Sts., Omaha, Neb.; Ft. Mason, San Francisco, Cal.; 17th and F Sts., N. W., Washington, D. C.; Newport News, Va.; Jeffersonville, Ind.; 1819 West 39th St., Chicago, Ill.; 2nd and Arsenal Sts., St. Louis, Mo.; Audubon Bldg., New Orleans, La.; San Antonio, Texas; New Cumberland, Pa.; Columbus, Ohio; or at the Surplus Property Division, Munitions Bldg., Washington, D. C. Further information may be obtained from any of the above offices.

Bids will be received at the nearest of the Zone Supply Offices UP TO 3:00 P. M. EASTERN TIME, MARCH 4, 1920.

The Government reserves the right to reject any or all bids or any part thereof.

The Quartermaster Corps is also advertising for sale, WIRE, IRON AND STEEL, FOODSTUFFS, CLOTHING, HARDWARE, HARNESS and TEXTILES in the Trade Publications covering the respective classes of materials.

Orange County Beekeepers

By Ernest Braunton

THE beekeepers of Orange County met at the South Center Street schoolhouse, Orange, on February 9 to listen to a varied program and make a visit to an apiary to examine foul brood. The principal address was by Prof. G. A. Coleman of the state college of agriculture, on bee diseases and their control, the chief points of which are here recorded.

"There are three diseases of bees with which we of California have to contend, American foul brood, European foul brood, and sac brood, and each is due to a distinct bacteria. As the symptoms are not the same in these diseases it is usually easy to recognize them in the apiary, though not always in certain stages. Scientists can tell in the spore stage but the apiarist must judge by external symptoms. The American foul brood is due to Bacillus larvae, the European to B. pluton. The two are distinct in the time of attack, the American attacking when nearly full grown, the European in a young stage, often as early as the third day. There is a decided color difference too; the European is light gray to chocolate brown, while the American is dark brown to black. There may be confusion if both are present at same time but they are never in the same larva at the same time. A third bacillus, B. Alvei, is sometimes present but not until after death and this bacillus causes a very strong and offensive odor.

"The larva infected with American foul brood is very ropy. When drawn out it stretches like new rubber to six or eight inches; while the European stretches like spent or rotten rubber to but one and a half or two inches and then breaks. Another difference is the position of the affected larva in the cell. In the European it is down in the bottom or on one side, looks like melted butter in a gray cell. In the American the larva lies on the lower side of the cell as you hold the frame in position and it also has a scale covering. In American the tongue is also extended, but not in the European. The bees are unable to remove the scales in the American but can in the European. Another sympton is that the disease spreads much more rapidly in the European. Drones and queens are also affected, but this is rare in the American, only the worker being attacked. While the American foul brood has a strong smell the European is dependent for odor on the amount of Bacillus Alvei present. The pure bred Italian bees will clean up better than the blacks or any other kind.

The Sac Brood

"The sac brood cannot be seen by any microscope, but it is a virus that attacks the larva in its older stages. The first symptom is a bloating and the head turns black. One may take a pin and lift the entire larva out. If it is punctured a watery fluid comes out. The decayed larva lies in the bottom of the cell turned up at both ends like a canoe. In American foul brood there will be several punctures in the cap; in the sac brood but one.

Treatment

"If only one colony has American foul brood it would be best to burn it; if more are affected shaking should be practiced to save the honey, bees and wax. Be careful that robbing does not start for this is apt to be worse than no treatment. Work in the middle of the day, use newspaper to shake on and burn papers when bees have gone to hive. Do the work quickly and robbing will not take place. The European foul brood is a disease of weak colonies, not necessarily small colonies, but weak in brood and bringing in honey. The disease may appear in big colonies if these are also weakly. It is most prevalent in spring and early summer, but good beekeeping will eliminate it. No special treatment is needed; to have young vigorous Italian queens is the most favorable condition. All others are inferior; the golden bee is merely an attempt to get a handsome bee. Resistant stock amounts only to physical perfection. Have your bees in a queenless condition for ten days; this will give bees time to clean up, and they will soon overcome the disease. Heat kills the germs and in feeding honey see that it is first heated through. It will take at least one hour to heat a five gallon can. The American bacillus is the most resistant known. Thrown out in the sun for several years it still revived and it will recover life after at least 40 years' dormancy. Burn out all hives with a plumber's gasoline torch. Boil frames, if you save them, in a caustic soda solution and use heat of some kind on every part."

ALIEN OWNERSHIP IN JAPAN

By Louis B. Stanton

We recently gave a general statement as to ownership by aliens of lands in Japan. As there is so much interest on this point we give herewith Attorney Stanton's entire letter:

* * *

As to ownership by aliens of real property in Japan I could find no current work upon the laws of Japan treating with the subject, but have made inquiry of a Japanese in Los Angeles who has been president of the Japanese Association for a considerable time and closely associated with the alien land suits which have arisen in Southern California and who is also highly conversant with the laws both of Japan and this country. The information which he has furnished me I believe to be entirely reliable and therefore wish to answer your question as follows:

In respect to leases of real property within the Islands of Japan, the citizens or subjects of foreign nations are by the law of Japan placed upon an exact parity with the subjects of Japan themselves. A lease of agricultural lands can be made and held for a period not to exceed 25 years. For commercial, residential or business purposes a lease can be made of lands not to exceed 99 years.

As to the ownership of lands the condition is as follows: Up to the year 1913 it is true that no foreigner was in any wise permitted to obtain title in fee to any real property in Japan. In the year 1913 there was passed by the Japanese parliament a law which provides in effect that foreigners who are the subjects or citizens of nations which permit the ownership of land by Japanese may be permitted to acquire land in fee simple within the ancient territory of Japan, but subjects or citizens of a nation which does not permit the acquisition of real property by Japanese subjects will not be permitted to acquire land in fee in Japan. That these rights shall be determined by reciprocal treaties by the respective nations and that the law shall be held in abeyance until proclaimed by imperial edict. This law, while it stands in the statute books of Japan today, has never been put in force by imperial edict. I am informed that the reason why it has never been placed in effect is that in 1913 there arose in California the anti-alien agitation which has been increasing in extent ever since, not only in the United States, but in the British Dominions.

SOUTHERN CALIFORNIA FAIR

At a recent meeting of the directorate of the Southern California Fair Association at Riverside, J. E. Wherrell was elected president, W. W. Van Pelt had already been elected secretary and manager. Mr. Wherrell is president of the Riverside County farm bureau, a successful dairyman and breeder of pure bred Jersey cattle. It is expected that every county in Southern California will be represented in agricultural and livestock displays at Riverside this fall. The dates will be October 11 to 16, inclusive.

"The Old Roeding Home Place" situated along Fancher Creek near Fresno, planted by Geo. C. Roeding, and one of the show places of the San Joaquin Valley, has been sold to Eastern capitalists. There are 640 acres in the place, 160 being in Thompson Seedless, 40 in Emperors, 24 in Muscats, 225 in figs, 60 in olives and seven in Navel oranges.

"You Bet They're Heavy"

—"And when I cash in on these beauties it'll put some weight on the right side of my bank book, too. I used dynamite to blast the holes when I planted this orchard and I never saw trees grow faster, look healthier or bear better fruit. My orchard is paying me big dividends and I am willing to give more than half the credit to

HERCULES DYNAMITE

"There is a book called 'Progressive Cultivation' that every rancher and orchardist in this state should have and every one of them can have it for the asking. It taught me a lot about using dynamite for planting trees and blasting between the rows, digging ditches, clearing my land of stumps and boulders, blasting subsoil and many other things."

Sign the coupon and mail it today. Your copy of "Progressive Cultivation" is waiting for you.

Hercules Dynamite is for sale at all leading dealers.

HERCULES POWDER CO. 1033 Chronicle Building, San Francisco, Cal.

Poultry in Our Orchards

By Frank P. Penn

POULTRY culture throughout the San Joaquin and other interior valleys, while at present underdeveloped, should appeal to many as very promising. This may be carried on in conjunction with general farming, and a reasonable number of fowls may profitably be kept by those living in our towns, but to the orchardist it stands out almost a means to ultimate success, a necessity.

While engaged in poultry raising in the Napa and Petaluma sections the hub of the poultry business in California, I had always been told that the heat in this interior valley was a great handicap during all the summer months and that egg production could not be kept to a profitable output during those months. I must go on record as finding it otherwise. A flock of some 600 mixed fowls, mostly Single Comb White Leghorns, during the summer of 1919 made us a net profit above the cost of all food of $170 per month during May, June and July. The grains, etc., were bought locally. Strange as it appeared to me the warmest days hadn't any noticeably depressing effect upon the egg record. Banish your fears along this line providing we study the food requirements of fowls during warm and cool weather. They are different, you know.

We have many important natural advantages to poultry culture. We would name first the abundance of green feed suitable for fowl consumption throughout the irrigated districts. In the citrus belt it is everywhere for the gathering. Upon the large egg farms carrying from 3,000 to 10,000 laying fowls in the Petaluma country the ground is plowed and seeded to either barley or wheat and then cut when from one to two feet high, an overhead expense not to be considered here. When one is feeding from 1,000 to 2,000 pounds of green food per day this will make you think Nature solves this problem for us. Again we are living in a grain producing section and can raise our own grain or buy direct from the grower. At the prevailing price of grains this means a saving of from $50 to $75 per 100 fowls per year. To the poultryman, outstanding above all, are the comparatively mild green winters, many days being like spring days. All of which working upon the fowl's nature produces the high priced winter egg in larger numbers and with less expense than can be procured in any other section we have seen.

Poultry farming, like all other branches of farming, demands a knowledge on the part of the operator as to climatic effects upon the details of the occupation. This knowledge can be gained only by experience. From watching broods of chicks hatched from February to April 15, 1919, all in 1,000 lots, we gleaned this much, that owing to the warm days and really cool nights of April and May creating an extreme range of temperature between midday and midnight chicks hatched after March 15 do not do so well as the February youngsters. This we consider our greatest lesson learned during 1919. Get the chickens hatched during January, February and not later than March 10 throughout this section, if raised artificially.

The keeping of 1,000 fowls for every ten acres of orchard is not a theory but a demonstrated success in many sections of the state. We are told by many of our most successful citrus men, locally and otherwise, that a large flock of chickens working in a grove will prevent or discourage thrips and many other parasites and insects which retard growth in the orchard. This much we have learned, that the constant working of the flock among the trees causes more or less of a dust mulch to form, preventing rapid evaporation after irrigation. It is well to so plan your building site that you can keep the fowls from the grove while irrigating. Poultry manure, being strong in ammonia is now pronounced by practical men who know as the best of all orchard fertilizers. One thousand fowls properly housed and fed will produce eight to 16 tons of high grade fertilizer per year. An average of ten tons at $20 per ton, delivered fresh to your groves whenever it is convenient for you to use it, is an item that cannot be ignored.

A flock of 1,000 hens started with the grove planting will provide profitable and living returns while waiting for the trees to come to bearing age and also will furnish the necessary fertilizer to produce a vigorous growth.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, February 2, 1920. Report for week ending January 30:

From November 1 to February 1 the hens in the contest at Storrs have laid more than 20,000 eggs. During the first three months each of the 1,000 hens has on the average laid one-third of an egg more than her expected yield. In the thirteenth week a pen of White Leghorns entered by B. S. Ells, Vineland, New Jersey, was in first place with a yield of 45 eggs.

In view of the nearness to the natural breeding and laying season, hens are expected to make rather rapid gains in the number of eggs they lay. On the other hand, not a few birds are perhaps out of condition on account of the severe, uninviting winter weather that has prevailed during the past two months. Such birds may not have any well defined disease but have perhaps contracted a little cold, they are not laying up to expectation and in some cases, at any rate they need a little toning up. For a condition of this sort use of sulphur has been suggested, allowing a tablespoon to ten hens twice a week in a wet mash mixed with milk. The sulphur can be given perhaps a little more conveniently in the dry mash, but should not be too long continued. If used in this way, one pound of sulphur to each 20 pounds of mash is sufficient.

The three best pens in each of the principal varieties are as follows:

Plymouth Rocks

Merritt M. Clark (Barred), 342; Jules F. Francais (Barred), 333; Oneck Farm (Barred), 326.

White Wyandottes

Langford Poultry Farm, 383; Merrythought Farm, 346; Herbert L. Warren, 326.

GermozonE
20 Years of Steady Growth in Sale
A WHOLE MEDICINE CHEST FOR
POULTRY, RABBITS, PET STOCK

Germozone is a universal and safe remedy for colds, snuffles, roup, sore throat, loss of voice or singing, influenza, bowel trouble, distemper, sore eyes or ears, canker, gleet, loss of fur or feathers, sores, wounds, skin diseases, or other affections of skin or mucous membrane.

I AM SO positive of the merit of Germozone that I feel I am doing anyone I can influence to use it, a most beneficial kindness. Frederick Winston Canfield, Prop. "Sunshine Farms" E. San Diego, Calif.

HAVE USED over 60 bottles of Germozone this year. Wish to thank you for the splendid remedies and preparations.—Benson Pheasant Farm, Silverton, Ore.

GERMOZONE killed the roup in 3 days.—Frank Galva, 120 Arnold St., Lackawanna, N. Y.

NOT A CASE of white diarrhoea in 3 years. I raise over 1,000 chickens a year. Good also for rabbits, birds, pet stock. —Ralph Wurst, Erie, Pa.

HAVE USED Germozone 17 years for chickens.—Mrs. T. A. Morley, Galien, Mich.

I USE GERMOZONE for chickens, stock and household. Cannot praise it too much.—Mrs. Wm. Hoeppel, Hugo, Okla.

GERMOZONE is simply grand for rabbits. — L. W. Browning, Boone, Iowa.

MY BIRD puppies don't know what distemper is. —Curley Smith, Kennett, Mo.

HAVE USED Germozone 12 years; the best for bowel trouble I ever found. Geo. F. Vickerman, Rockdale, N. Y.

Germozone is sold by dealers, in both tablet and liquid form. Tablets mailable, 25c, 75c and $1.50 sizes—from Omaha. Book on treatment of disease FREE.

The LEE POULTRY LIBRARY (5 books) is worth its weight in gold to any poultry raiser who will use it for frequent reference and advice. Readers say, "Takes a lot of mystery out of the chicken business." "More help than any other source," etc. These books FREE to anyone sending 6c stamps to cover mailing.

GEO. H. LEE CO., Dept. F-30, Omaha, Neb.

Hillview Barred Plymouth Rocks---The Birds of Quality

These birds are the famous Aristocrat strain, Fort Wayne, Indiana. They are bred for heavy laying and exhibition quality.
Every entry won in the late shows: Los-Angeles P. B. Assn., and San Diego Exhibitors Club.
Our birds are fed no stimulants or patent mashes to increase egg production. They are fed to produce strong vigorous chicks.

Eggs for Hatching ....$ 5.00 per setting 15 eggs
Special Mating .....$10.00 per setting 15 eggs

State whether you prefer the light or dark matings

Hillview Ranch Box 156, Fullerton, Cal.

up to the 50 per cent production mark. Counting only the hens that are laying, the average percentage is 66 per hen. Mr. Walls has again captured the lead for the week with a score of 52 eggs, while his hen No. 16 once more forgot to observe the Sabbath. High records are as follows:

Leading pens to date: Walls, 494 eggs; Neef, 434; Rose, 421; Enterprise Poultry Ranch, Chino, 407.

Highest individuals to date: Walls, 74; Peck, 63; Walls, 62; Barker, 61; Gibson, 61; Webb, 60.

Highest pens for week: Walls, 52; Enterprise Poultry Ranch, 50; Bellow Bros., 48; Rose, 48; Peck, 45; Wilson, 45; Amsbaugh, 44; Webb, 40.

Poultry Queries

Conducted by J. A. Koethen

Poultryman's Association

What is the poultryman's association? What are the obligations and privileges of a member?—Subscriber, Paicines.

Do you mean the local association or what is known as the "Poultry Producers Company?" The poultry association, as it is commonly known in California, is an organization of the poultry men in a certain locality for marketing and mutual improvement of one sort and another. Here in Southern California, and I believe throughout the poultry producing sections of Central and Northern California, every community that produces much poultry has its local association, named for the community, as "Arlington Association," "Pomona Valley Association," etc. The Poultry Producers Company of Central California and Poultry Producers Company of Southern California are cooperative organizations including all the local, associations though only such members of local associations as sign up are actually members. The member signing up agrees to market all his eggs through the organization, which grades, candles and markets them. The eggs are collected two or three times a week by trucks which run from each locality to the central office, which in Southern California is in Los Angeles and in Central California in San Francisco. A poultryman must have a sufficient number of hens to enable him to market a case a week, I think. He must also agree to follow the rules of the organization in regard to shipping, etc. In the Southern California organization it costs two and one-half cents a dozen, or nearly that, for the Poultry Producers to handle the eggs under present conditions. To meet this expense the two and one-half cents is deducted from the weekly check, and whatever portion is not needed is afterward returned to the producer in the form of stock. A letter to your northern organization, Poultry Producers of Central California, Petaluma, would bring you full information.

Bronchitis

About a month ago a hen began to sneeze and the next day had a coughing or a wheezing sound in her throat and in a day or so another hen began the same way and tonight I think there are several more that will have the same thing in a day or so, and in each instance the hen quit laying. We used turpentine and lard, also coal-oil and lard to rub their heads and throats, but couldn't see that it did any good. Could you tell me what the trouble is and what the remedy might be?—Subscriber, Dinuba.

Your hens have bronchitis, due to dampness or crowding or drafts in the roosting house. A dose of olive oil twice a day, about a tablespoon at a time (more will do no harm) is better than turpentine or kerosene, but the best remedy is to get rid of the cause. Look over your house and see if there are cracks back of the roosts or if the hens are crowded in so closely at night that they are too warm and consequently chilled when they come out in the morning. If there is dampness in the house from any cause whatever, get rid of it. Sunshine should penetrate every corner at some time during the day. Moldy scratching litter or "heated" corn sometimes causes similar trouble. See that everything about your house is clean and dry and that one side is open to sun and air and the other three sides tightly closed, and you will not have many colds.

FEATHER EATING HENS

We find that hens kept in overcrowded quarters frequently form the habit of feather eating. Many pay little attention to this, since it is not a distinct loss like the egg eating habit, but it does ruin the appearance of the flock.

To break up this habit the worst offenders should be sold immediately upon finding them engaged in doing this. The balance of the flock should then be supplied with a variety of foods. Keep them busy and contented by making them exercise.

FIND THE REASON

Says the Indiana Farmers Guide:

"Too many people regard luck as a chief factor in the poultry business.

"They fail to consider that certain effects always follow certain causes, and that 'there's a reason for everything, good or bad.' Infertile eggs, dying chicks, sick hens, non-laying hens, lousy quarters, etc.—are these the result of bad luck? The direct opposite of all these, then—are they the result of good luck?"

We live and learn and profit by our experiences. Sometimes experience is rather costly, but we usually never forget the lessons we learn. We hate lice and mites but we must be careful about our method of exterminating them. A few weeks ago a poultryman was worried about his hens. They were lousy and he decided to use kerosene on them to destroy the lice. He put kerosene on his fowls with the result that he lost about half of his flock. This was a big loss to the man but he has learned his lesson.

Some women have used salty grease on chickens and young turkeys and have lost many of them. We who have had the experience know that lice can be killed by better methods than kerosene or salty grease. We cannot afford to thus experiment upon our flocks.

Chickens need to drink plenty of water and they will drink freely if they can get it.

HOW TO CONTROL THE BROAD BEAN WEEVIL

The broad bean weevil is found in the main broad bean section of California and its presence has seriously handicapped that industry. Use of uninfested or treated seed, destruction by grinding of all infested beans not used for seed, and late planting are the best methods of controlling the pest, according to specialists of the United States department of agriculture who have been studying its activities.

The beans from crops planted after March 1 are much less apt to be infested than those planted between November and March. In the drier and hotter localities where late planting is not possible, it is especially important to plant only seed which is uninfested or that which has been treated to kill the weevil.

Infested seed either should be treated with carbon disulphide or held over in tight receptacles until the second year when the weevils in it will be dead.

To treat the beans with carbon disulphide, from seven to ten pounds per one cubic foot, for at least 24 hours in a box, barrel, or room as air tight as it is possible to get, should be used. The smaller amount is effective in perfectly tight receptacles, but the larger amount should be used if the fumigating box or room is not tight. The liquid is placed in a shallow pan at the top of the box or is poured over the seed.

Prevent Chick Loss

Put the whole flock through the first few critical weeks sound and healthy.

Thousands of poultry raisers are using **Dr. LeGear's Poultry Prescription** to save their flocks from leg weakness, gapes, bowel troubles, etc., and to fit them for strong and sturdy growth and profitable laying.

Use Dr. LeGear's Poultry Prescription

to save your chicks, strengthen breeders and help fertility.

Try a Package at My Risk

Every package is sold on a money back guarantee. For twenty-seven years a practising graduate veterinarian poultry raiser using my own remedies, I stand ready to refund your money through my dealer on any Dr. LeGear Remedy that fails to give satisfaction. See your dealer today.

Sold by 40,000 dealers—never by peddlers.

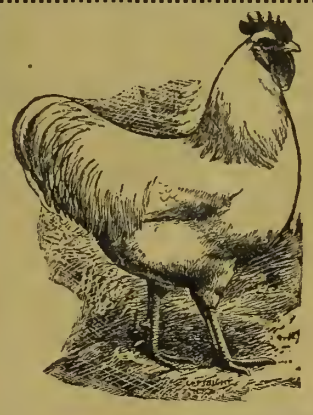
128 pages. A most comprehensive treatise on the care and treatment of Stock and Poultry. Written by Dr. LeGear after 27 years experience as a practising graduate veterinary surgeon and poultry expert. Send 10c to us today,—we will mail it postpaid.

Dr. LeGear's Poultry Prescription



HIGH CLASS WHITE PLYMOUTH ROCKS

The result of ten years careful breeding. For utility and exhibition qualifications my stock is unexcelled. As layers they are the equal of any and in the show room they have demonstrated their merit. At the recent Southern California Fair my fowls were awarded four out of a possible six first premiums.

Fine vigorous males and females, $5.00 each. Exhibition birds, $10.00 each and up. Eggs from stock the equal of any in America, one setting, $5.00; two settings, $9.00; three settings, $12.00. Per hundred, $20.00.

MAMMOTH BRONZE TURKEYS

Vigorous birds bred for utility and exhibition purposes. Large; prolific layers; finely marked and richly bronzed. Fine toms at $15.00, $20.00 and $25.00 each. A few hens at $10, $12 and $15 each. Eggs from standard bred, utility matings, $5.00 for 12; $9.00 for 24; $25.00 per hundred.

Eggs from exhibition matings, $10.00 for 12; $15.00 for 24; $50.00 per hundred.

The Reliable Blue Flame Wickless Oil Heated Hover

This Hover Represents Our 30-Inch 42-Inch and 52-Inch Sizes.

THE MODERN HOVER

This hover has the same chick capacity as the coal burning brooder. They are made in four sizes, 18 inch, 30 inch, 42 inch and 52 inch hover. A few of the special points on this oil heated hover are as follows:

- Burns Coal Oil
- Steady Blue Flame
- Comfortable and Easy to Operate
- Economy of Operation
- No Wick to Trim
- No Oil Fumes
- Visible Oil Feed
- Convenient and Safe
- No Coal, Smoke or Gas
- The Flow of Oil Is Regulated Automatically.
- Abundance of Heat

Safety in Handling Dynamite on Farm

By Guy G. Means

THE writer has been present at hundreds of blasting operations and blasting demonstrations on farms. In talking over the various good and bad features of blasting practice, our attention has been called to several points which should bo brought to the notice of all users of dynamite. At tbese demonstrations we always hear of any accident that may have happened in the community. There are always arguments for and against varlous practices.

Among people generally there seems to be an idea that the slightest shock or jar, such as dropping a stick of dynamite on the ground, will cause it to explode. This is not true. In fact it is practically impossible to explode ordinary 20 to 40 per cent ammonia dynamite without a cap. The writer saw one carload in a railroad wreck in which there were 280 boxes mashed up so they had to be repacked. No explosion occurred. However, this statement should not be taken as a license to mistreat the explosive. It is desired merely to emphasize the fact that dynamite if handled carefully is as safe to use as any commodity on the farm.

On the other hand, caps are much more sensitive and should be handled as carefully as possible and always kept away from any place where their accidental explosion might set off a quantity of dynamite.

The writer has time after time heard farmers say, "Why, dynamite won't explode from heat!" "You can burn it without its exploding." This is true in probably 95 per cent of cases, but in the other five it does explode from heat or fire. You never know when your case may be one of the five per cent. Therefore, never thaw dynamite in front of a fire, in the bake oven, or on a boiler. You say you know of hundreds of cases where it has been done safely. I know of dozens of cases where death and destruction have been the result.

Another bad method of thawing, commonly used, is to place the dynamite directly in hot water. This causes the nitro-glycerin in the dynamite to come out into the water. You lose strength on the dynamite and may have an accident from the nitroglycerin sticking to the pail.

There is no necessity or excuse for a farmer taking chances on any of the above methods. On the average farm there is a pile of horse manure in which tbe box may be buried over night, and when you desire to use tbe explosive in the morning it will be thoroughly and safely thawed. If this method is not practicable, a wash tub may be half filled with water (not too warm to place your hand in it) and the dynamite placed in a dry pail or pan which may be set in the water and covered with an old piece of carpet. Always remember that the rules in the box are based on a thorough investigation of all accidents, and it pays to observe "Safety First." I know a man who brought several boxes of dynamite bome, placed them in the kitchen by the stove with the caps. He went to put his horses in the barn. Before he got back, his house, his wife and seven children were gone. Dynamite resents the implication that it is "fool proof."

As to caps: The greatest number of accidents come from carelessly leaving them around the house or barn where children get hold of them. I have known of many accidents from tbis cause. Your hurry may cause your child the loss of an eye or a hand. Put the caps where the children cannot get them. The old hardened blaster often crimps the caps into the fuse with his teetb — yet, there is no better way to lose your head or a piece of your jaw. A knife or pinchers is equally dangerous. Use a crimper! It does not cost much and is absolutely safe.

Do not ever carry the caps in your pocket. I know a man who put a box in his overalls' pocket. He forgot them and shoved his hot pipe down on top of the box. He stayed in the hospital nearly a year. Always carry them in a box or basket in which there is some soft material.

Finally, in taking your explosives out to the field it is best to carry the caps and dynamite in separate boxes. Use a dynamite case or similar box fitted with a handle. On the outside of it nail a thick strip slotted to hold your knife and crimpers. Carry the caps in a separate box with a tight lid. Then don't smoke while blasting.

If you observe the above precautions you will avoid tbe only accidents of which I have heard in four years of daily contact witb dynamite on the farm.

WE DO NOT APPROVE

We do not approve tbe theory tbat white men and women and children should get out and dig in the gardens and fields of California as the Japs are doing. We have nothing against the Japs, or against any other race on earth, thank God, but we hope tbe day will never come when Christian white people will adopt Japanese methods of success.

Success is desirable; it is a tbing that should be striven for; but there is such a thing as paying too big a price for it.

We have heard folks along the roadside in California saying as tbey looked at a Japanese family at work in a truck garden: "What a wonderful people; if white people would work like that there would not be so many of them poor."

The scene that these complacent folks in the automobiles contemplated was typically Nipponese. At work, with backs bent tirelessly, were the father and the mother and a brood of several children, the youngest able to do little more than toddle. They had been up before the dawn and they would not cease until dark, or after. And soon after the middle of the night the man would be up again to drag his produce to the market. Their house was a makeshift thing of old boards and tin cans. It could be called a home only by the wildest flight of the imagination.

Now, the local banker would tell you that this family has funds deposited with him. It is a family with money.

Personally, we do not think that God intended to make people work like that even when He put toil on the human race as a punishment for the transgression of Eden. And, personally, we would take to the high road and be a tramp sooner than spend a lifetime in the way this poor, misguided heatben spends his life.

Maybe American white folks are a little lazy at times, and sometimes shiftless, but we still like them best—and their ways.—McGroarty in L. A. Times.

ANTELOPE VALLEY SQUIRRELS

Last year a gigantic squirrel drive was waged in the Antelope Valley, Los Angeles County, the first attempt, and 90 per cent were exterminated. These have increased during the past year so that about 25 per cent of tbe original number are thougbt to be possessed of the country. Tbe war is now on for 1920, or soon will be and it is hoped to practically exterminate all found.

The official drive will be March 31 April 3, and 15,000 pounds of poison have been ordered. The drive will be under the joint auspices of the Los Angeles County horticultural commission; the United States biological survey; the rodent control division of the state department of agriculture; the Los Angeles farm bureau; the Southern Pacific railroad, tbe water department of Los Angeles, the Kern County horticultural commission and the farmers of the valley. The acreage to be covered is more than 200,000 and has been divided into six districts, as follows: Del Sur, City Ranch, Elizabeth Lake, Fairmont, Neenach and Bailey's Lake. Meetings have been held in these centers and arrangements perfectod for securing tho necessary labor, material and equipment. Last year some of tho farmers were doubtful of the value of such drives, but results were so satisfactory in the first ono that all are enthusiastic over the 1920 prospect. — E. B.

Hauling a Capacity Load on Plowed Ground. International 2-ton Motor Truck owned by Mr. K. Taguchi, the well-known Cantaloupe King of Rocky Ford, Col.

Where the Going is Hardest

On the clay roads of the Mississippi Basin —

In the loose sandy soil of the California orchards and along Florida's sandy forest roads —

On the steep and rocky slopes of the mountains of Pennsylvania, West Virginia, Colorado, and Tennessee, where the up-hill hauling is severest —

In Montana, the Dakotas, and Minnesota, where the snows are deepest—

In plowed fields, on country roads and mountain trails — wherever road and weather conditions make hauling most difficult —

You Will See International Motor Trucks

The toughest hauling problems are being solved with International Motor Trucks. They are conquering the difficult jobs. They are proving beyond all question that Internationals are built to do the work and keep going. They are making good where others fail.

That is why you find Internationals most numerous where hauling conditions are most stubborn — they stand the strain of constant daily grind — they can be depended on to force their way right ahead — they are always ready for hard jobs — they give dependable service day after day at low cost.

Your farming will be easier, more pleasant and more profitable when you are the owner of an **International Motor Truck.** Sizes to choose from, ¾-ton to 3½-ton. Branch houses, distributors and dealers everywhere. Write us for a catalog and let us answer your questions.

FOOTHILL SHADOWS

By Margaret A. Condon

THE inspection of the little ranch was over. The real estate agent and his prospective purchaser entered their waiting car and drove off, while Henry Kirwood, his cheerful countenance slightly more serious than was its wont, went slowly up the walk.

Laddie followed at his heels, with tail drooping, and long collie nose touching his master, sensing dimly that all was not well with his world. Jack—sleek, shiny and well fed in his little corral—tossed his dark mane and whinnied his loneliness.

A woman stood on the veranda, where it looked out on the wonderful view of valley and mountain, hill and plain, and over all fell the softening shadows that wait on the late California afternoon.

She looked up questioningly as her husband approached.

"Well, Anna," he said, "I guess he'll buy it," and to the listener a pathetic note was apparent in the calm voice. "Likes the place very much. Said he'd bring his wife tomorrow to look around and they'll make a deposit. Wanted to know if I'd include Jack and Laddie in the sale. Guess we'll have to, Honey," as a cry of dismay broke from the woman. "Can't keep them in the city you know. But, dog-gone, it made me feel like shooing him off the ranch when he began mauling Jack around as if he already owned him. Laddie wouldn't make friends. Would you, boy?" and he stooped to pat the beautiful silky head, while faithful, questioning eyes looked their dumb appeal to know what it was all about—this sorrow that had come to his kindly master and mistress.

"Another thing, Anna," and the quiet voice held a suspicion of huskiness, "says he'll soon have that big sycamore down. Shades the house too much, he thinks."

"Cut it down, Henry! Our beautiful tree, with Ruth's little house in the branches! Why, it would be a crime!"

Silence fell between them, for each was thinking of the daughter who had tired of the little foothill home and sought a position in the city. But Ruth loved her father and mother devotedly, and a few weeks of city life had convinced her that she wanted them with her, so the little ranch was to be sold. Not from stress of necessity, but to gratify the wish of the girl who did not realize what it was costing her parents to give up their home.

"Too bad, too bad," Henry Kirwood said, half to himself, "that Ruth couldn't have married Frank Grayson. He's a fine boy."

"And Ruth in fond of Frank," his wife said quickly. "How could she help it when he has been devoted to her all their lives? I never could understand why she said no. But, we mustn't blame Ruth, Henry. She's young, and wants to see life."

"Life!" the man echoed. "Can she see anything finer than that, Anna?" as he raised his hand and pointed. "Can she ever see anything more beautiful than God's handiwork in the Glendora Valley? Look at the miles and miles of orange groves. Sniff the breeze that brings us fragrance by night and day! Raise your eyes to the mountains with the afternoon shadows upon them! See that stream trickling down under the sycamores! Wouldn't any milloinaire in this dry California give a slice of his fortune to have that on his land? Life, indeed! This is what I call life; not an apartment in the city."

The Day of Washington

By John Morrison

When the Day of Washington
Brings its message clear and true,
Stop and think a moment, son,
What its meaning is to you.

Hear, O hear, the ringing call,
Sounding o'er the years between,
Bidding you to banish all
That is false and base and mean;

Bidding you to seize and hold
What is highest, what is best,
What is needed most to mould
Life to meet its sternest test;

Bidding you be ready, son,
With your hands and with your heart,
When the Land of Washington
Calls on you to play your part.

What is she singing?

IT goes like this—"How dear to my heart are the scenes of my childhood, when fond recollection presents them to view" etc. It is one of the 26 popular old ballads in the 32 page song book, "Songs of Long Ago", which we will send free to anyone returning the coupon below. Send for your copy today.

Baldwin

A Name that Stands for Real Worth in
PIANOS AND PLAYER PIANOS

You cannot make a mistake in choosing a Baldwin-made Piano or Player-Piano, because in so doing you are following the example of the world's best musicians of yesterday and today—DePachmann, Bachaus, Sembrich, Henry, Pugno, Scharwenka, Eddie Brown, Tillie Koenen, LaForge, Richard—and hundreds of others. The Baldwin line includes the Baldwin, Ellington, Hamilton and Howard Pianos, and the Manualo, "the player-piano that is all but human". Our local representative will be glad to demonstrate and let you try any of these instruments.

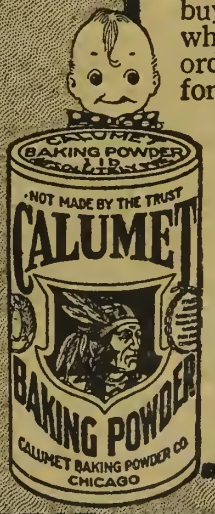
CALUMET

—gives better bakings that go further. It strikes straight at the root of extravagance—waste—and reduces living cost in a sane, sensible, way.

Calumet Baking Powder never fails to properly raise all bakings—produce the best results.

Makes Most Palatable and Sweetest of Foods

Calumet bakings *do* go further, because they are deliciously good, are never thrown away. *And* because they have greatest of keeping quality—stay moist, tender and oven-fresh for days.

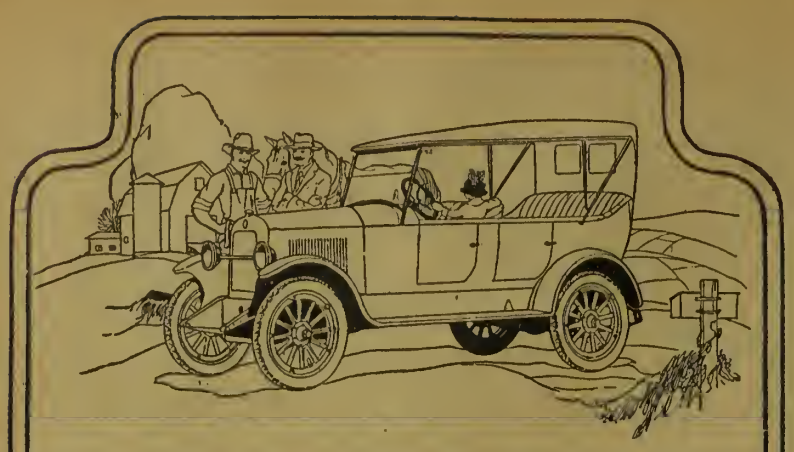


You save when you buy it—moderate in cost. You save when you use it—has more than the ordinary leavening strength—therefore you use less. You save materials it is used with—no failures.

Generations of good cooks have used Calumet—because it positively proves its superiority and economy. It comes to you from the largest, most sanitary Baking Powder Factory in the world—absolutely pure and as perfect in leavening power as the day it left the big Calumet Plant.

Contains only such ingredients as have been officially approved by United States Food Authorities. Sold by your grocer under a definite money-back guarantee, if it doesn't prove "best by test"—in your own kitchen, in *any* baking.

BEST BY TEST



BRISCOE

Briscoe cars are made in Touring car, Sedan, and Thredor Coupe models. And one of the three is just the car you've been wanting, at the price you want to pay.

"The leader of light-weight cars" is the kind of car that's long been wanted on the farm. It is a car that meets every farm purpose. It is roomy, clean-cut, dependable. It is comfortable to ride in and has every convenience. It is a car that will travel any road—that will climb the steepest hills and stand the strain of rough travel. And in power performance, it has made wonderful records for owners—records that mean low cost of operation and maintenance.

Let the nearest Briscoe dealer post you on all facts. Send for new, handsome Briscoe catalog which accurately and truly describes all Briscoe's features. You must have this book to intelligently choose your car. It's free. Write for it today. No obligation.

"Then let us keep it, Henry. How can we give it up, even for Ruth?" and she broke into passionate sobbing.

"There, there, Anna! You don't mean it. Of course our girl wants us with her. Perhaps we'll get used to city life after a while." But a wistfulness of tone belied the words in which he sought to comfort her.

A loud peal of the telephone sounded and Henry went inside to answer it. He returned in a few moments, bravely struggling to maintain his cheerfulness, and said:

"I suppose it will have to be, Anna. That phone message was from the agent. They want the place. He'll be out tomorrow afternoon to arrange for the escrow."

"You'd better write Ruth, Honey," he continued, as his wife remained silent. "I'll take the letter down to the postoffice and she'll get it first thing tomorrow morning. Tell her the ranch is to go—Jack, Laddie and all."

There was little sleep that night for Henry Kirwood or his wife, and in the cool early dawn they rose, ostensibly to make preparations, but moved about mechanically and accomplished nothing. The morning mists rolled off the mountains and a light breeze swept up the valley, surcharged with fragrance of orange and lemon bloom.

As the hours sped by, in a routine way Anna began preparations for the noonday meal.

Henry came in and said he had just seen Frank Grayson driving down toward the station. "Seemed to be in a hurry, Anna. Must have had a phone from someone asking him to meet the train."

Suddenly came the "honk, honk" of an automobile, followed by a wild and joyous barking from Laddie. "Honk, honk" again. Frank Grayson's car stopped at the gate. Ruth Kirwood sprang out and rushed up to the house.

"Oh, Dad! Mother! Mother!" she cried, "am I too late? Is the ranch sold?"

"No, Ruth," the father answered, "it isn't sold yet, but the buyer is coming this afternoon to close the deal."

"But you don't have to sell, Dad? You've signed no papers?"—keen anxiety in her tone.

"No, dear," her mother found voice to say. "We don't have to sell. Calm yourself, Ruth. Don't you want the ranch sold?"

"No! No! Oh, Mother! when I received your letter and you said you had a buyer, and that Jack and Laddie must go, and the big sycamore with my little house in the branches"—laughter and tears mingling as she wound her arms around the frail mother—"it just broke my heart. Laddie, dear Laddie, sell you and Jack? Never, never!" and down on the floor went Ruth, to hug Laddie.

"I hate the city," she continued. "I'm coming home. I want to live here—here with the mountains and the hills and the stream, and our big sycamore, and you, Mother, and Dad, and Jack and Laddie. I love you all," and Ruth became rather incoherent, with renewed caresses for Laddie, until her father asked her smilingly if she would like to have Jack brought in.

Then Ruth's eyes turned to the doorway where her tall lover stood, the lovelight shining in his fine eyes. Noting her glance, he spoke:

"But, Ruth," he said whimsically, "where do I come in?"

The girl stood up. A bright color flamed in her cheeks as she went over and placed her hand in his.

"Frank, dear," she said softly, "I made a mistake when I said I didn't love you. I'll marry you tomorrow if you want me."

HOME FURNISHING

By Mary R. Bird, Merced

MANY excellent ideas have been set forth in these columns recently on lessening the high cost of clothing. Another high cost that strikes near to the soul of the housewife (and of the "house-husband" as well) is the high cost of home furnishings.

In combating this particular high cost the three factors that Anna Lenington Heath of Pomona found essential in cutting the cost of clothing are the very weapons to be used if you would make of your home an ideal nest for you and your brood and keep within the range of your purse.

"I have found these three things helpful," says Anna Lenington Heath, namely, "thoughtfulness in buying, good workmanship in making and fair treatment in using."

The greatest of these factors as applied to furniture and accessories is "thoughtfulness in buying." That is your best instrument of combat; it has many points, each of which means an effective thrust into the vitals of the ogre, H. C. of L.

A Real Home
Beauty combined with comfort for each member of the family.

Buying furnishings for the home, even if it is only a few, is a procedure which brings great pleasure if one has really high ideals and the determination to work them out.

You know you need something. The dining room rug is wearing out, the couch in the living room is disreputable looking, your bedroom furniture has served its time and your whole house needs the freshening effect of new draperies here and there.

You want, in those new things you are going to buy, the articles that will seem to sink into their surroundings and give new life instead of showing up the old to a disadvantage. Also, you want the things that will suit the particular needs of your family. If the dining room is used regularly and the children occasionally drop food and spoil the floor covering, you of course want a rug which will stand such treatment and retain its cheerful demeanor. If father insists upon having his nightly frolic wtih the children on the living room couch, then you should not choose a frail affair upholstered in a light colored fabric. A more substantial article would look quite as artistic from the first and it would give the added satisfaction of being usable as well as good looking.

And there are size, color and finish to be considered, taking into account the position, the location as regards sunlight, and the furniture that the new additions are to be used with.

After you have a fairly well formed idea as to your needs it is well to take time to select those things which conform and have the lasting qualities of good style and workmanship. For therein lies the economy of good buying. As to the quality of workmanship you will have to rely to an extent upon the reputation of the firm from which you are purchasing.

Then, with fair treatment in using your purchases you will have dealt Mr. H. C. of L. his death blow and at the same time you will have made your home safe for comfort and happiness.

The Cultivator Patterns

BE SURE TO SEND SIZE

3150. Child's Dress. Cut in 4 sizes: 4, 6, 8, nd 10 years. An 8 year size will require ⅞ yards of 27 inch material. Price, 10 cents.

BEATING THE H. C. OF L.

By Mrs. W. G. D., Arizona

BEATING the H. C. of L. is very important to all of us and becomes more so every time we shop. Here are some suggestions from a rural community which I hope some others may find as helpful as I.

When my gingham aprons begin to wear thin in front I take them off the band, cut them down the center, turn the outside edges to the center, sew them together, hem what are now the outside edges, and replace on band. This I find adds once again the life of an apron.

We make all our wash clothes by cutting squares from old underwear and hemming or overcasting the edges to prevent raveling.

For my coverall aprons for rough out-of-door work I use the backs of my husband's old overalls. Two or three pair will make an apron similar to a butcher's apron which will wear a long time.

This spring I made myself several smocks from old cotton dresses which were made in the very narrow style. These worn with a skirt made from a remnant of gingham make very serviceable house dresses.

When the soles of our rough work shoes first begin to wear my husband puts on a half-sole of green rawhide with the hair still on. This wears much longer and better than ordinary leather.

The care of our woolen winter clothes is a problem which is now confronting us. The moths must be kept out. After the garments have been aired and sunned they may be packed away in a tight trunk or chest with pieces of cotton saturated with oil of cedar placed among them. The oil of cedar does not have so disagreeable an odor as moth balls and leaves much more quickly when the garment is aired. Another method which I have found very good is, after the garment has been aired and one is absolutely sure there are no moths in it—make an envelope of newspapers by pasting them together, large enough for the garment and seal the garment in the envelope. When using this method one must be very sure every hole is sealed tightly or the moths will find it.

One can not always make over or take care of his old clothes. Some time he has to have new ones. I have found that I can make my husband's summer underwear similar to the B. V. D. union suit from flour or sugar sacks, which may be purchased by the dozen at the grocery or baker shop much more cheaply than we can buy muslin. I take the strong pieces of our heavy knit cotton underwear to make an elastic belt. This keeps the union suit from splitting in the back.

Another use for sugar and flour sacks is in making household "linen" such as sheets, pillow cases, table cloths and napkins. About six sugar sacks make a respectable sheet. One sugar sack or 100 pound flour sack will often make a pillow case. Four large sacks feather stitched together and hemmed with an inch hem make a very nice everyday table cloth.

We wear out the feet of stockings long before the legs are gone so we buy stocking feet for a very small sum. These make the legs do double duty.

Another feature in buying is in dress gingham. I always buy ten yards and get a reduction in price for so doing. My mother, who lives in a different locality, does the same and we exchange five of our ten yards. Thus we each have two house dresses for a little more than the cost of one.

From the new pieces left after cutting out garments I piece quilt tops. Flour sacks dyed the desired color make very good linings. Considering the present price of ready made quilts or the silkaleen for quilt covers I need not tell you my way is a saving.

I hope these suggestions may prove as helpful to some others as many of the hints in the Cultivator have been to me.

THIS WEEK'S PATTERNS

Lovelier than ever is this week's group of patterns. The charming little girl's dress 3150, with tiny French sleeves and square yoke with its bit of individual embroidery, is fitly companioned by the little boy's suit opposite. If the trousers and vest were made of plain blue combined with a white blouse with white or smocked pearl buttons, wouldn't it be a picture?

The graceful gown 3140-3143 would be exquisite in any of the large flowered voiles now being shown in the stores, with the very modish, short sleeved waist in white voile. This style is not only beautiful and distinctive, but exceedingly practical. The waist may be made separate and laundered frequently, and another thing—where one dislikes to wear dress shields the making of the waist and sleeve portion of white dispenses with that disagreeable necessity.

The close fitting sleeve set in the shoulder shows the new-old mode, and the side drapery on the skirt of 3134 is very popular. This dress seems particularly adapted to silk or light wool. In a white broadcloth with black velvet collar, cuffs and buttons it would be extremely striking. But look out for that low cut collar in the back. If you are not absolutely sure the back of your neck is beautiful, cut the collar a little lower in the front, with a high shawl collar effect in the back, and it will be infinitely more becoming. Another point: The drapes at the side of the skirt must be faced. If the dress is made of cream white broadcloth a lining of chiffon in the same shade would be found most satisfactory.

In gingham or percale with white vest and collar of pique or Indian Head or linen, or plain colored gingham, the school dress 3152 will be just right.

2932 is simply adorable—there's no other expression for it, even if those poor words have been so much overworked. A sweet clean little girl, with freshly shampooed hair with a big fluttery bow of her favorite color, who has just donned this darling dress—can you think of anything prettier?

Another of our beautiful house dresses, simple and practical, with an air of positive distinction.

A graceful misses' dress with draped waist and kimono sleeves is 3132. If make in silk the unique decoration around collar and down front of dress may be of tiny roses made of bias folds of soft silk. These are charming if made well. In jersey we would suggest a plain collar with pearl buttons to trim the side front.—R. P. D.

WASHINGTON'S BIRTHDAY RECIPES

Cherry Pie

Make a shell of good, rich paste and fill it with canned cherries, mixing a level tablespoon cornstarch with the juice. Dot the top with diamonds of pie crust and bake.

Mount Vernon Pound Cake

Beat together to a cream one scant pound butter and one pound powdered sugar. Separate a dozen eggs, whites and yolks, whisk the whites to a stiff froth and whip the yolks until lemon colored and thick. Add the yolks to the creamed butter and sugar. Stir thoroughly, fold in the whites and stir again. Sift a pound of flour and add lightly, little by little, stirring only enough to mix smoothly. Pour into pans lined with buttered paper and bake an hour and a quarter in a moderate oven. Take care not to stir or shake the pan until the cake is well set.

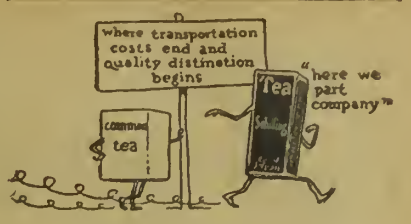
Coconut Hatchet Cookies

Two eggs, beaten light, one cup thick cream, one level teaspoon salt, three teaspoons baking powder, one cup sugar, one cup grated coconut, three cups sifted pastry flour, candied cherries. Sift together three times the flour, salt and baking powder. Add this mixture, the sugar, cream and coconut, to the eggs, and mix thoroughly. Roll out and from a pattern cut it into hatchet shaped cookies and bake to a light brown. When cold, ice with your favorite icing and stick two candied cherries on the blade of each hatchet before the icing is set.

Cherry Salad

Cut thin slices of large, sweet oranges, surround them with quarters of canned pears, and on the orange slices pile a little mound of large, sweet canned cherries, removing the pits and putting in their place shelled filberts or hazelnuts. Pour over all a dressing made by mixing the juices of orange, pear and cherry. If too sweet add a little lemon juice. Put a spoonful of whipped cream on top.

Camphor will remove those white spots on the furniture.



Take 15 or 20 cents from the price of tea and off goes half the quality. It costs as much to cure, pack, and transport common tea as fine tea, and that is the biggest part of the cost.

Schilling Tea is the fine practical economical tea of this country.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

A Source of Strength

Science reveals that cod-liver oil is a fruitful source of vitamins and that its use helps a child grow normally.

Scott's Emulsion

made of the richest and purest *Norwegian* cod-liver oil, never fails in its mission to nourish and strengthen. *Let the children have a plenitude of Scott's.*

My K Hand Stump Puller

Gives Your Hand 96,000 Pounds of Power

Big stumps! stumps and trees with deep tap roots! any stump that can be pulled with the best inch steel cable!—you *alone* can pull with my "K" Hand Power Stump Puller—*without digging and without the expense of teams and powder.* I guarantee it. I refer you to U. S. Gov. officials. I give highest banking references. If you have stump land, the cheapest way of clearing it is with the

HAND POWER

K Stump Puller

Frank Hance, a *one-armed* farmer of Bowie, Md., pulling a double silver maple 3 ft. 8 in. in diameter at the ground, with deep tap roots. This is an easy pull for the "K," as the cable can be hitched high and the leverage is consequently greater.

How the "K" Pulls Biggest Stumps

The "K" works on the leverage principle of the ordinary lifting jack, except that the power is applied on a cog-wheel instead of a standard. 100 lbs. push on the lever develops a 48-ton pull on the stump—all an inch steel cable will hold. One man operates it alone—no teams to pay for—no walking.

A Mechanical Wonder

Made of finest steel—guaranteed against breakage. Weighs only 171 lbs.—easily carried or hauled about on its own truck wheels. Has two speeds—60 feet per minute for hauling in cable or for small stumps—slow speed for heavy pulls. *Works equally well on hillsides and marshes where horses can not* work

Owners Praise It

H. Sinclair of the Dept. of the Interior, a U. S. Gov. official, writes: "The stump puller is a wonder."

Ernest Thompson Seton, author and naturalist, declares the "K" "a great success."

Hundreds of owners write in, telling of pulling six- and seven-foot stumps, of pulling faster and pulling bigger stumps than by any other machine.

Special Offer We are making a special offer to get a "K" Stump Puller introduced in every neighborhood. Write us today for full information and for free book on Land Clearing and about our Wonderful Drag Saw.

An Institute With Permanency

MORE organization was the result of the citrus institute held last Friday and Saturday at San Bernardino. Or, rather, the institute which heretofore has been brought into being annually at the National Orange Show has now become a living, permanent thing. The name of the new organization is the same as has been carried by the former annual institute, The California Citrus Institute.

If the plans of its founders are fully carried out it will become far more than an organization to call together and conduct meetings which shall discuss horticultural topics. We believe the intention is to promote better practices in culture and, more, to encourage the scientific and technical side of fruit culture.

Since Dr. Webber has been in California he has urged the necessity of such an institution. In the Los Angeles State Fruit Growers convention the matter was brought up. Committees were appointed and later meetings of producers of the state called at San Francisco at the time of the Panama-Pacific Exposition. But the plans of the committee proved to be too ambitious and the organization failed of realization.

The range of the present organization covers only the science of horticulture and its board of nine directors is made up of representative and active horticulturists who will give impetus to the movement.

The governing board consists of nine men, three elected for three years, three for two years and one for one year. They are: For three years, Dr. I. G. McBeth, Whittier; Dr. J. I. Barrett, Riverside; A. D. Shamel, Riverside. For two years, W. H. Fleet, Sespe; V. V. LeRoy, Claremont; R. C. Allen, Bonita. For one year: R. E. Swing, San Bernardino; C. C. Chapman, Fullerton; J. H. Straight, Redlands.

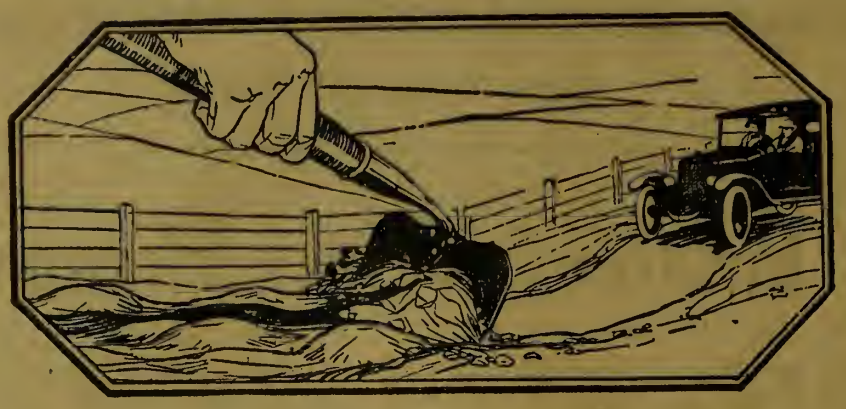
The by-laws adopted call for semi-annual meetings, one winter meeting, presumably to be held in connection with the National Orange Show; the other, a summer meeting, time and place left to the directors.

Besides the perfecting of this permanent organization the two day institute brought out addresses and discussions which will have large influence on California horticulture. Perhaps the most striking single feature of the program was the general discussion— (Continued on Page 234.)

National Orange Show—A Really Truly Showing of California's Great Industry.

Overland

TRADE MARK REG.



With Wonderful, New *Triplex* Springs Roads Seem Cleared Of Bumps

THERE is only one way to fully appreciate the greater comfort introduced by the new Overland 4—

And that is by riding in this car with its 130-inch *Springbase!*

Gone are the usual bouncing, swaying and jolting. Instead, due to the three-point suspension *Triplex* Springs, there is a *smooth gliding* sensation.

The passengers are not only free from ordinary road-blows, but the car itself is shielded, prolonging its life and reducing upkeep.

The light weight of this new Overland 4 means economy of fuel and tires.

And it is fine looking, and luxuriously cushioned; it is fully equipped from Auto-Lite Starting and Lighting to Electric Horn. Let the Overland dealer show you why Overland 4 makes possible, for the first time, heavy-car comfort and road steadiness with light-car economy and convenience.

Concerning the Loquat

By Robert W. Hodgson

AMONG the promising, but as yet little appreciated, fruits which can be grown to perfection in California, few possess so many attractive features as the much neglected loquat. With few exceptions the trees now growing in this state are seedlings given little or no care and bearing rather small and inferior fruits. At the present time, it is conservatively estimated that there are less than 50 acres of bearing trees of good varieties planted in commercial orchards in the entire state. When one considers that excellent varieties are now available as a result of 20 years of work both in the way of selection of seedlings in this state and in the importation of varieties from all over the world, and that the loquat comes into the market at a time when it is practically bare of fresh fruits, and consequently brings uniformly high prices, the neglect of this attractive fruit is difficult to understand.

A good loquat orchard at six or seven years from planting should average five tons of salable fruit to the acre. The average price received during the past five years has ranged in the neighborhood of seven cents per pound, although early varieties frequently bring as high as 30 cents. This average figure would indicate a gross return of some $700 per acre for relatively young trees. Older trees should, of course, produce more. That these figures are conservative is testified to by the owners of the 50 or 60 acres of commercial orchards now in bearing. The fruit ships well, if handled properly, shipments having been made successfully during the past two or three seasons to such markets as Detroit, Philadelphia, Pittsburgh and New Orleans. With a fruit coming in as early as February and bridging the gap between fall apples and storage pears and cherries and apricots in the spring, it would seem that the only hindrance to a rapid extension in planting should be lack of market demand, which certainly ought to be rather easily overcome by a little judicious advertising. In short, it would seem that California fruit growers are "overlooking a good bet" in not giving the loquat more attention.

A Bunch of Luscious Loquats

Probably the chief reason why the loquat has been neglected in the past lies in the fact that on account of its Asiatic origin and comparatively recent introduction into this country it is as yet but little known to the American consumer. The loquat undoubtedly originated in Eastern China, where it is still found growing wild in vast forests and much esteemed. The first written description of the fruit occurs in Kaempfer's "Amoenitates Exoticoe" published in 1712, referring to its being found in Japan. Although the exact date of its introduction into California is not known the tree was reported in 1879 as being rather common in gardens in Sacramento. For many years, however, it was grown more as an ornamental than as a fruit tree. It belongs to the rose family and is a close relative of the apple, pear, quince, hawthorne and medlar.

General Requirements

The loquat is a semi-tropical. It can be grown as an ornamental, in colder regions, but fruiting is prevented since the tree comes into bloom during the fall and winter months just at the time when freezing temperatures may be expected. The blossoms and young fruits are quite easily injured by frosts so that for fruit production its culture is limited to approximately the same districts as the lemon and orange.

Loquat trees are resistant to both heat and drouth, but cannot be expected to bear satisfactory crops of good fruit unless supplied with a sufficiency of water. Excessively hot dry winds are also very detrimental at the time of ripening of the fruit as at this period it is rather easily sunburned.

The tree is not at all particular as to soil requirements, doing equally well on many types ranging from porous sands to more or less tenacious clays. Hardpan close to the surface is not a serious hindrance to its success, providing sufficient water is available to ripen up the fruits and bring them to good size.

A natural tendency to overbearing, resulting in small and inferior fruits, makes it necessary either to thin out the clusters, or crowd the trees into hedge rows in order to bring individual fruits to suitable size and quality.

Propagation

Although the tree comes readily from seed there is no more excuse for planting seedling loquats than for planting seedling peaches or apples. Trees budded to the best varieties alone should be planted. The two common stocks used are the loqnat

(Continued on Page 365.)

Go For the Gopher

By Ernest Braunton

THE Los Angeles County horticultural commission is conducting such a vigorous campaign against ground squirrels that the more thickly settled parts of the county will soon be cleared of them. No such campaign against gophers is contemplated, for a heavy force would be needed to handle it and the work is slower and more difficult than in squirrel control. Therefore an educational and advisory campaign is being waged so the farmer may do his own work in the cheapest and most effective way. To this end the United States biological survey has given the services, for two weeks, of F. E. Garlough, one of the bureau's experts, for a series of demonstrations and illustrated lectures. At Downey, on January 2, Mr. Garlough spoke to an audience of 110 about as follows:

"The gopher problem is far more difficult of solution than that of the squirrel, for he lives an underground life and we cannot therefore know what is going on or what the results of our work for some time. The United States government undertakes some extermination in forests and large meadows and I will tell you what we have found to be the best methods.

Life History

"There is but one litter of gophers born each year, and this may range from December to July, so do not be deceived into thinking you find two litters because you see the young at different periods. The litters contain from two to ten in California. The gopher is active at all seasons for he does not hibernate and is most energetic during the wet season. We used to think he was not migratory and moved underground only, but we now know he moves considerable distances during the night.

"A street contractor tarred a piece of roadway in San Joaquin County and the first morning thereafter found 100 gophers stuck in the tar in a 200 yard stretch. Mr. Neville states that in Monterey County, after a poison campaign, 250 dead gophers were found on the surface, showing they do come out during the night. They will move from one-fourth mile to a full mile. Usually they will cross roadways in the night but frequently they tunnel beneath. At Riverside we found a tunnel from a grain field, under a street, and up to an orange tree in the adjacent orchard.

"One gopher may have from ten to 40 mounds and in season his family will be with him. His first operation results in a station of semi-circular form from which radiate tunnels which may extend from 50 feet to 600 feet. He has two series of tunnels, one for feeding, which is but six or eight inches beneath the surface, and a lower storage and nesting tunnel that varies from two to five feet beneath the surface, with many lateral pockets, one a nest and the others storehouses, his food storage ranging from one to four quarts, for he stores ten times what he needs or uses. The passage from the upper to the lower tunnel is often kept plugged so he cannot be overcome by gas or drowned, though many meet death by these means. In the upper tunnel gas may have to travel 200 to 300 feet in loose soil and before it can reach that distance is nearly all dissipated.

Methods of Control

"Considerable trapping is done and is quite effective. There are many good traps on the market, both box and wire, of which the smaller wire traps are best for the ground is least disturbed in their use. We have found in the trapping of all wild animals that the less you disturb their haunts and arouse their suspicions the more successful you are. In order to clear an orchard or field it is necessary to clear surrounding orchards and fields, therefore the problem is one affecting communities. For that reason local branches of the farm bureaus, the centers, should take up the work. Last year the national loss through gophers was estimated at $30,000,000. Kansas estimated its loss at $5,000,000, principally in alfalfa. In California in 1919 the loss was not less than $10,000,000. Hawks, owls and snakes, foxes, coy-

(Continued on Page 365.)

Agricultural News Notes of the Pacific Coast

Northern California

Humboldt County is manufacturing a Swiss cheese of high quality.

Six dredgers are at work widening the canals of the Glenn-Colusa irrigation district.

Glenn County rice growers are asking establishment at Willows of a rice experiment station.

Agricultural students at the University of California have organized an animal husbandry club.

Palo Cedro, Shasta County, has arranged to hold a county farm bureau fair during the coming season.

Some Butte County fruit growers are installing pipe lines in order to carry water with less seepage loss.

One firm of exporters at San Francisco has purchased nearly $4,000,000 worth of rice for export, largely to the Dutch East Indies.

Northern California Rabbit Breeders Association plans the biggest showing of rabbits at the state fair, ever made in the state.

Several extensions of the boundaries of irrigation districts in the Sacramento Valley have been deferred owing to the present water shortage.

An enthusiastic bunch of Berkshire breeders gathered at the Western Berkshire Congress held at Davis Tuesday and Wednesday of this week.

Mendocino and Sonoma Counties have been holding fall clip in expectation of getting 50 cents per pound. Best offer at the present time is 35 cents.

Butte County rice growers have found that the mosquito pest has been largely brought under control by a natural enemy of the larva, a small beetle.

Glenn County rice growers claim rice millers are discriminating and giving unfair prices, and the growers are taking the matter up with Louisiana mills.

Sonoma County's gopher week resulted in distribution of several hundred cans of gopher poison and the estimated loss of many thousands of lives—gophers.

The state water commission has recommended that Williams, Colusa County, present petition for formation of an irrigation district that will comprise about 10,000 acres.

The Pacific Rice Growers Association is securing options on warehouse sites in Colusa and Princeton. The association hopes to construct and operate a string of cooperative warehouses.

Curtis P. Clausen, formerly of the pest control of the state horticultural commission, more recently with troops in France, has been commissioned to go to Japan for the purpose of parasite collection.

The Sutter County Peach Growers Association and farm bureau are uniting in an effort to have horticulturists and viticulturists included in preferred lists of power users. This in view of restrictions placed upon power users because of low water.

Paradise claims a recent farm center meeting at that point was the largest ever held by any center in the Butte County bureau. Points discussed were farmers telephone and the growing of berries and small fruits which has become a great industry in that section.

Central California

Long staple cotton gin has been installed at Kearney Park, Fresno.

Fresno County reports increase of over 4,000 automobiles during the last 12 months.

Sacramento Valley irrigators are asking for prior rights in use of hydro-electric power.

Independent packers are already bidding 15 cents per pound for the 1920 raisin crop.

Merced County is planting more walnuts this year than the entire acreage now out.

At the recent election of the Associated Raisin Co., the former board of directors was re-elected.

Recent showers have been sufficient to prevent many cattlemen from shipping their stock out of the state.

The city of Los Angeles has filed on 14,000 acre-feet per annum of the water of Rock Creek, Inyo County.

A 2,000 acre tract is to be planted to walnuts, peaches, apples and other fruits near Salinas, Monterey County.

Watsonville, Santa Cruz County hopes to have a branch of the Virden Packing Co., now located at Sacrameto.

Recent rains have been sufficient, and vineyard plowing and other work is in full swing in all the San Joaquin Valley.

Lumber mills of the Sierra Nevada will begin season earlier than usual because of the extreme shortage of lumber.

The farm center at Aromas, Monterey County, is asking assistance from the state university in its fight on oak root fungus.

Stanislaus County farm bureau is conducting a drive for new members and is determined to roll up a membership of at least 1,500.

Kerman held a community auction sale at the high school grounds last Saturday. Nearly everything from a pumping plant down was offered.

The Peach Growers Inc., have not named prices for next season's dried fruit, but it is rumored that independents are offering as high as 25 cents.

Chlorine gas is now being used in squirrel destruction by Horticultural Commissioner Roullard of Fresno County. It gives close to 100 per cent kill.

A dehydrating plant, formerly planned for Salinas, Monterey County, will not be constructed because of inability to secure supplies and equipment.

The Farmers Union meeting at Ceres, Stanislaus County, recently discussed the matter of the Union purchasing one of the Stanislaus County banks.

Fresno County chamber of commerce has delegate at Washington working for enlargement of Sequoia national park and changing its name to Roosevelt.

West Side farmers are anticipating so much profit from the coming rains that they are offering to donate to a "rainmaker" $1,500 per inch for all rains which come.

The Fresno chamber of commerce has been arranging for sale of some 200,000 pounds of Turkish tobacco grown in the San Joaquin Valley and now thinks a sale has been negotiated with French purchasers.

Southern California

The Imperial County Good Roads Association has been organized.

Riverside deciduous fruit producers are appealing for a cooperative cannery.

Riverside County is proposing to aid in road construction in the Coachella Valley.

Orange County apricot orchards are soon to be placarded "Sunsweet Standard Orchard."

Imperial Valley wheat planting this year will not be more than one-third that of last year.

Fallbrook, San Diego County, is planting largely to blackberries and other small fruits.

Orange County farm bureau has refused membership in its organization to Japanese farmers.

The National Orange Show at San Bernardino drew out largest attendance ever yet secured.

The second annual Antelope Valley, Los Angeles County, squirrel drive will be held March 31-April 3.

The Automobile Club of Southern California is erecting sign posts in many sections heretofore unposted.

California fruit shippers are to be benefited by the addition of 4,000 new cars to the service of the Pacific Fruit Express.

Eucalyptus trees are giving heavy bloom and beekeepers are finding bees busy and in most sections no feeding will be necessary.

Two large rubber companies are endeavoring to secure contracts with Imperial Valley growers to produce Long Staple Pima cotton.

Riverside has been having strike amongst Mexican orange pickers. They have been getting $3 per day and are now demanding $3.50.

Farm bureau directors of Imperial Valley urge more effective enforcement of laws and the stopping of crime which is rampant.

Mexican fruit pickers at Corona made demand for $3.60 per day instead of the $3 being paid. Request was refused and a strike is on.

The board of directors of the California Lima Bean Growers Association is discussing methods for next year's work. No prices have yet been named.

Commissioner Kellogg of Santa Barbara County finds excellent results from use of double strength dust spray recommended for walnut aphis on pea aphis.

Rodent control meetings in northern Los Angeles County will be held at Elizabeth Lake, March 7; Fairmont, 7; Bailey's Lake, 8; Neenach, 9; City Ranch, 10; Del Sur, 10.

The Citrus Belt Milch Goat Association recently held meeting at El Monte, Los Angeles County, and discussed matter of extending the usefulness of the "little dairy cow."

The McPherson, Orange County, Citrus Association shipped during last year 175,000 boxes compared with 70,000 the preceding year. Packing house costs were 51 cents per box.

Commissioner Ryan of Los Angeles County reports puzzling results from fumigation in foothills sections of eastern Los Angeles County. Many orchards require two fumigations to control the black scale.

The Coast and General

Northwest Shorthorn Breeders Sale at Spokane, March 3 and 4.

A berry cannery is being erected in the Chilkat Valley, Alaska.

Northern Arizona counties have named April 2 as arbor day.

Alaska reports the midlest winter since records have been kept.

American Farm Bureau Federation meets at Ames, Iowa, March 3.

Arizona farm bureaus are working to secure livestock disease laws.

Western New Mexico reports spring grass growing finely in lower levels.

Colorado reports cattle on nearly all of its ranges are requiring feeding because of heavy snows.

One contractor recently took the job of cutting 10,000 cords of wood in the Hood River section.

It is said that California leads all states in ownership of motor cars, having one car to 5.6 persons.

A fire destroyed warehouse at Davenport, Washington, recently, burning 35,000 bushels of wheat.

A cold storage plant is being constructed with capacity of 2,000,000 pounds of fish at Chatham, Alaska.

The Goodyear Rubber people are promising cotton growers of Yuma establishment of a gin for long staple cotton.

The Arizona Egyptian Cotton Growers Association recently marketed a carload of 75 bales of long staple cotton at 97½ cents per pound.

The Grande Valley irrigation project in Colorado reports the past few weeks the coldest season since records have been kept in that section.

A farming district near Astoria, Oregon, will install a gravity water system which will supply about 75 large ranches with irrigation water.

For the first time since 1917 the water flowed over the spillways of the Roosevelt Dam on February 17. The reservoir now contains 1,369,340 acre feet.

The seed division of the state department of agriculture of Washington has tested for germination 500,000 pounds Washington grown vegetable seed.

The Umatilla irrigation project in Oregon has this season broken temperature and all kinds of weather records. The lowest temperature reported is 37 below zero.

Insects have attached themselves to the sides of Tieton Canal, near Yakima, Washington, in such numbers that they have greatly lessened the carrying capacity of the canal.

The Arizona experiment station is authority for the statement that concrete lined canals on Tucson farms have effected a saving of $40,000 in water at a cost of $18,800 for lining the canals.

While reindeer have been a great factor in the development of Alaska it has been found they will not exist south of the line where reindeer moss refuses to grow. They require this moss as a part of their winter ration.

Preliminary estimates of the acreage of cotton in the California-Arizona district indicate that there will be 500,000 acres planted in the two states, or approximately double the acreage of 1919. At present prices, at an average yield, this crop should be worth $100,000,000.

A Pomona Orchard Poultry Farm

By Jean A. Koethen

WE HAVE been told that the secret of making money with poultry lies not in the hens but in the man behind the hens. If this is true—and who can doubt it—the success of the Ross poultry farm at Pomona is easily accounted for. When Cornele G. Ross came from Vermont to Pomona ten years ago he came with 30 years' experience as office man for a large manufacturing concern behind him. Close application had undermined his health, and outdoor work in a milder climate held out the only promise of continued usefulness. Purchasing two and a half acres of land, which has since been increased to five, he and Mrs. Ross turned to poultry work for health and living. From a small apricot orchard with practically no buildings but a comfortable dwelling house to a fully equipped 2500 hen plant, with houses of the most up-to-date pattern, stocked with bred-to-lay White Leghorns is transformation enough, it would seem, to have taxed the resourcefulness of a man of vigorous strength. Mr. Ross owes his success largely to the fact that he makes his head save his heels.

Economical Feed Hopper
The top looks as if it were solid board, but it is two boards slanted in at right angles to each other.

The first venture was made with colony houses 5 by 6 holding 25 hens each and containing no place for scratching in rainy weather. Caring for even a few hundred hens in such houses was too big a job, even if the hens had been comfortable. Something more compact was absolutely essential.

Mr. Ross believes heartily in combining orchard and poultry, but he does not believe in running hens in the orchard. His experience with those first colony houses showed him that it was possible to injure the trees by the continual application of manure and the no-yard house appealed to him as the best solution of the problem. It leaves more room for trees and at the same time makes it possible to house a larger number of birds on the same acreage. If the birds are kept in small flocks it is also possible to pick out the sick hen as soon as she shows the first symptoms of illness. This line of reasoning leads inevitably to the Charles Weeks house and Mr. Ross' houses, while they are all slightly different in certain particulars, follow this type.

The Charles Weeks House

I might say in passing that Pomona is the one place in Southern California where the Charles Weeks type of house flourishes. Mr. and Mrs. Ross drove me past a dozen or more places where this style of house is used. The houses are not all exactly alike. They differ slightly in arrangements for ventilation, feeding and nests, but in general the type is followed. Whether Mr. Ross set the fashion or followed it, I do not know, but the fact remains that at least 20 out of the 70 commercial poultrymen in Pomona use this house.

A long house, eight feet deep and as long as the builder cares to make it, and divided into sections eight feet square, each housing 20 hens, is the type of house known as the Weeks house, and the six houses on the Ross ranch are all of this type. The first models had the nest boxes high up in front, according to the original model, but those built later have them lower down. Earlier models have the nests in groups of four, but in his latest house Mr. Ross uses groups of three because he has noticed that hens always incline to lay in groups of three nests. These groups of three are built so that the group in one section adjoins the group in the adjoining section. This is in order that all six nests may be emptied at one setting down of the egg pail.

The frames of all the houses are of 1 by 3 and 2 by 2 timber, 7 feet high in front and 5 feet at the rear, the shed roof projecting three feet in what is known as the "umbrella roof," to afford protection from the southerly rain storms which sometimes sweep this section. Most of the houses have dirt floors with a layer of sand on the dirt and a layer of straw on the sand. The sand is brought from a neighboring wash twice a year at an expense of $6 for every 16 pens. The latest house, which is not quite finished, has a cement floor. Mr. Ross is not sure that he prefers cement to dirt, but thought it only right to give it a trial. Hens cannot dust on cement, and a thicker layer of sand may be needed.

Economical Devices

After considerable experimenting Mr. Ross has evolved a mash hopper which does not waste the mash. It is a box 36 inches long, but instead of wire or slatted top it has two thin strips of lumber set at an angle above the middle of the hopper. The birds put their heads under these strips, which keep them from getting their feet into the feed. One of these hoppers is set in the partition between each two pens.

Week's House In Apricot Orchard
Notice the nest boxes arranged in pairs and the long trough in front where the birds get all their green and part of their grain.

Another clever device is the arrangement of the covers of the nest boxes

(Continued on Page 366.)

Use of Cover Crops in Citrus Orchards

By I. G. McBeth before Citrus Institute at San Bernardino

THE successful production of citrus fruits in Southern California depends in a large measure upon supplying the deficiency in organic matter and nitrogen, which is characteristic of most citrus soils. Many citrus lands are notably deficient in organic matter, and generally speaking where the supply of organic matter is low there is a corresponding lack of available nitrogen. Thus in the management of such soils the problems of maintaining the organic and nitrogen supply are closely related.

In working out a system of soil management which will maintain a satisfactory supply of organic matter in the soil the grower should clearly understand that the term "humus" is not synonymous with "organic matter." Humus includes only that part of organic matter which has passed the more active stage of decomposition, and he should also clearly understand that it is the decay of organic matter and not the mere presence of it that gives life to the soil. It is the opinion of the speaker that one ton of fresh active organic matter such as plant roots, crop residues, green manure, or animal manure, incorporated with the soil, may be of more value for a year or two than ten tons of old organic matter which has passed the active stage of decomposition and has reached the stage commonly known as humus.

The rapidly increasing citrus acreage combined with the scarcity and high cost of organic matter available for fertilization purposes, makes the problem of maintaining the organic content of citrus lands one of considerable magnitude, which renders it desirable to give thought to the methods available for applying organic matter to the soil in practical agriculture. The methods applicable to citrus lands are two:

By the application of animal manure or crop residues.

By cover crops grown in the orchard and incorporated with the soil upon which it is grown.

Under present conditions, the high cost of animal manures combined with the extremely variable character of the product makes its use by the average citrus grower a somewhat questionable practice. The speaker has analyzed cars of so-called manure which contained as little as seven per cent of organic matter. It is needless to state that the nitrogen content of this material was also extremely low. Many growers are applying manure of very poor quality at a cost of several dollars per ton. Practically all of these growers assume that they are applying a liberal amount of organic matter and nitrogen to their groves; but from our experience during the last four years we are inclined to believe that a careful analysis of the product applied would in many instances show that the organic matter and nitrogen actually applied is far below the needs of the soil and also that the grower is paying an exorbitant price for the plant food and organic matter received.

We have found the organic content of animal manure to vary from seven to 60 per cent. The average organic content of manure sold to citrus growers is probably no more than 20 per cent. Bean straw and other plant substances are approximately 80 per cent organic matter. Therefore one ton of bean straw or other plant residues of similar character would contain as much organic matter as four tons of ordinary manure.

The nitrogen content of manure is also quite varied. We have found the nitrogen content of manure to vary from .15 to 2.5 per cent. The average of a large number of cars analyzed during the last three years is about .45 of one per cent.

The extremely variable character of manure should be given serious consideration by the grower who is depending upon a moderate application of this material to maintain the productiveness of his land. It is obvious that the use of a material so variable in organic and nitrogen content must give a very spotty condition which will in all probability result in a portion or possibly all of the ground being under-fertilized by the application of a material having little or no fertilizing value. For the good of the industry as a whole, I hope the time will come when manure will be sold on a standardized basis, but even though manure were sold on a standard basis and the grower protected against the purhase of worthless material, the supply of locally produced animal manure is only sufficient to fertilize a very small percentage of citrus lands, and even when bean straw and other crop residues are included, enormous quantities of organic material must be shipped in from outlying sections in order that the organic content of citrus lands may be maintained. High freight rates on organic fertilizer can mean nothing less than extremely expensive fertilization.

(Continued on Page 336.)

A GOOD INVESTMENT

GRANT SIX

Is the Grant Six a good buy viewed from the standpoint of an investment? One looks at an investment from the standpoint of safety of principal and the yield of interest or earnings.

Safety is dependent upon the marketability of the product and the strength of the organization back of lt.

Looking at the purchase of a Grant Six in this light, does it stand the test?

Let us see. It delivers high returns in the way of comfort, serviceability, dependability,—safe, troubleless transportation.

It yields higher returns for every dollar invested than any car of similar price. It is more comfortable to ride in, easier to look after, less expensive to maintain and has a higher resale value.

Back of each Grant Six is a company with unsurpassed manufacturing facilities, strong organization, ample financial strength and a powerful dealer organization.

For as long as Grant Sixes have been built the demand has always exceeded the supply. There have been two to five people ready to buy every Grant manufactured.

These conditions make the Grant Six an exceptionally good investment.

Write for new illustrated catalogue and name of Grant Six dealer in your community.

The Conservation of Manure

From Address by A. D. Shamel at Citrus Institute, San Bernardino

THE increasing use of organic fertilizers for improving citrus orchard soil conditions in Southern California is a most important factor for consideration. These organic fertilizers include manures, cover crops grown in the orchards, alfalfa hay, bean straw, and other organic materials. The manures commonly used for fertilizing the orchard soils at this time include those secured from horses, cattle, sheep, poultry, and to a more limited extent bat and bird guanos.

Ten years ago when the writer first came to California for the purpose of working in citrus orchards very little manure of any kind was used in the citrus orchards with which he was familiar. At that time and for several subsequent years the manure used in the orchards with which he came in contact was largely secured from neighboring dairies, livery stables or ranch barns. For the most part the manure secured from the dairies and livery stables was given to the citrus growers in order to get it hauled away from their premises. The only expense incurred was for hauling and distributing in the orchards.

The demonstration of the value of manures in improving citrus orchard soil conditions in many districts led to the use of other organic fertilizers, namely, bean straw and damaged alfalfa hay. These materials at the time they first came into use for fertilizing purposes were very cheap as compared with their present value. I remember that several lots of bean straw were purchased in the field for from $3 to $5 per ton and damaged alfalfa hay for from $4 to $6 per ton.

The supplies of bat and bird guano were at this time secured largely from Arizona, the west coast of Mexico and the islands adjacent to lower California. This material was comparatively more expensive than the manure, bean straw or alfalfa hay and consequently was used only to a limited extent at that time. During the past five years and more, particularly during the past two years, these conditions have markedly changed. Large concerns handling manure have sprung up who employ men to search out every possible source of manure on ranches or livestock ranges in California, Arizona, Utah and Nevada and secure manures for the citrus orchards. The price of bean straw and alfalfa hay has gone to a point where it is practicaliy prohibitive for orchard soil improvement purposes. The bean growers have learned to keep the bean straw for the fertilization of their own fields instead of burning it or selling it to other districts. In some cases citrus orchardists are growing or are preparing to grow alfalfa primarily for use in improving their soil conditions.

It is apparent that the total cost of manure used in citrus orchards in Southern California during each of the years 1918 and 1919 was approximateiy $1,750,000. There are no figures available, so far as I am aware, which show the amount and value of bean straw, alfalfa hay or other organic materials used for fertilizing citrus orchard soils. There is no doubt, however, but that the value of these materials used in the years 1918 and 1919 amounts to at least $500,000.

Sources of Manure

I have been unable to find any data on the quantity or value of manure secured from poultry farms although I am aware that this source of organic fertilizer is of considerable importance.

* * *

Values as given in tabie on chart exhibited by Mr. Shamel are:

Tons of manure produced by the average animal in one year: Horses, mules and colts, 5.2 tons; value of nitrogen at 15 cents per pound, $9.20; total value, including other elements, $14.77. Amounts and vaiues manures of other animais: Dairy cattle, 8.5 tons, nitrogen $12.36, total $18.78; sheep and goats, .39 tons, nitrogen $1.60, total $2.27; swine, .61 tons, nitrogen $1.38, total $2.13. Mr. Shamel's tabie then gave the total values of aii manures produced by California livestock as $42,896,871.

The vaiuations are: 15 cents per pound for nitrogen; 3½ cents per pound for phosphoric acid and six cents per pound for potash. These figures are too low for present conditions but have been used in order to avoid suggestion of exaggerated valuations. Probabie present actual vaiues doubie those shown.

The 42 million vaiuation is arrived at by taking number of animais in state as reported in 1910 census.

* * *

There is a great loss in the valuable constituents of manures. One of the most interesting and reliable reports showing data of this character was issued by the Cornell experiment station. This of course refers to Eastern conditions, but I believe that it well illustrates the great losses wbich frequently occur. The horse and cow manures referred to were exposed to the weather during April to September, during which period there was considerable rainfall. When the manure was taken up for distribution the horse manure was found to have lost 57 per cent and the cow manure 49 per cent in gross weight. The ioss of nitrogen in the horse manure was 60 per cent; phosphorus, 47; potassium, 76; total percentage of value, 65. Loss of nitrogen in the cow manure was 41 per cent; phosphorus, 19; potassium, 8; total percentage of value, 32. These losses were partly due to leaching but were largely the result of decomposition. One class of bacteria breaks up the humus and forms carbonic acid gas and ammonia which pass off readily into the air unless the decomposition is carefuliy managed. Another class of bacteria acts upon the soluble nitrogen compounds and nitrogen gas is set free. Manure is most valuabie when it is fresh. However, it is frequently impossible or impractical to secure and use the fresh manure and therefore intelligent measures should be taken to conserve its valuable constituents during storage.

The methods of storing most favorable for conserving its piant food include tight stabie or feeding floors with absorbent litter or cisterns for the liquid portions, manure pits and compost heaps. It has been estimated that the manure from a thousand pound steer for six months is worth over $2 more when made on a concrete floor than when collected on a clay floor. A growing number of cattle feeding and horse feeding establishments are installing concrete stable floors and feed lot floors. This arrangement of the feeding floors should be extended to all dairies or other animal feeding piaces. In addition, cement troughs should lead from these floors to cisterns where the liquid manure can be collected. Of course it goes without saying that in the stables and feed lots absorbent litters are of great value.

Manure Pits

A slight beginning has been made in California by livestock owners in the installation of suitable manure pits in which manure can be collected and held untii it can be distributed. These pits usually are dug out of the ground near the feed yards and are frequentiy arranged with cement walls and floors. Some of them are so arranged that wagons can be driven directly into the pits and ioaded or unloaded with a minimum of cost. All such pits should be provided with cisterns into which the liquid seepage can be drained. When the manure is taken out this liquid portion can be pumped out and distributed in the orchards. So far as possible these pits shouid be screened or otherwise protected in order to prevent fly breeding. There are enough of the different styies of pits now in use so that anyone who desires to do so may get reiiabie information as to methods of construction and the handiing directiy from those who have had experience.

Compost Heaps

So far the compost heap is used only to a very limited extent. Ordinariiy it inciudes layers of manure and layers of peat. These are sometimes turned over after several months in

(Continued on Page 332.)

FARMERS ARE GROWING RICH IN Imperial Valley--YOUR OPPORTUNITY!

The Best Value in Farm Land to Be Had in America Today

Don't think of farming as a constant fight against almost overwhelming odds. It may be that in some agricultural districts, but not in IMPERIAL VALLEY. Here, it is a big, profitable BUSINESS, yielding great and certain returns on a reasonable investment. Don't struggle along for years trying to meet payments on over-valued farm lands, when you can buy the most productive lands in the world, in the marvelous Niland-Calipatria district of Imperial Valley, at the amazingly low prices of

$90 to $175 per Acre
(according to Soil and Location)
¼ Down and ¼ Annually

Water Stock $20 per Acre
$5.00 Down and $5.00 Annually
or $17.50 per Acre Cash

You can "pay out" more easily in five years on this land than in twenty years on ordinary land, because you can be certain of THE TWO MOST IMPORTANT FACTORS IN SUCCESSFUL FARMING. These are:

(1) Assurance of Big Yields from Every Crop Every Year.
(2) Certainty of Ready Markets at Premium Prices.

Think what this means! These two factors alone will solve most of your problems, and in addition will show the way to quick attainment of the many things that READY MONEY will buy, to develop and equip your ranch and make your family happy.

Facts and Figures That Spell Money to Farmers

UNEQUALLED PRODUCTION

Astounding statistics prove that Imperial Valley farm lands are the greatest in the world. More than 50,000 prosperous people are now living in this matchless farming district. Their production last year totaled over $63,000,000, or an average of $150 per acre for every cultivated acre in the Valley.

Two big crops are grown each year on the same land. Pasture rental and other side issues bring additional profits. Cotton growers are making fortunes. Average production ¾ bale per acre, with some farmers raising 1½ bales. Tire factories now contracting long staple at 60 cents a pound, and loaning farmers $25 an acre in advance.

More than 9000 car loads of cantaloupes shipped in 1919. Nearly 4000 car loads of winter lettuce. Other winter vegetables in proportion, all sold at top of market.

From eight to ten cuttings of alfalfa each year, averaging 1¼ tons to the cutting. Imperial farmers are raising 18 to 30 sacks of barley per acre, followed by a ton of milo maize the same year, on the same land.

The New Marvel---Frostless Lands, Ideal for Grapefruit

Our offering includes the wonderful frostless land along the south side of the Southern Pacific Railroad, in the Niland district. Here is being grown the finest grapefruit produced in America. Lemons thrive. Winter vegetables reach the market ahead of even the early products of other sections of the Valley. Table grapes are unsurpassed. Tremendous possibilities in melons, berries and fruits of all kinds. Think of buying such land at these prices!

Every kind of specialized and diversified farming pays big. A "livestock paradise." One of the West's greatest dairying and hog raising districts. Turkeys, chickens and bees make unequaled profits because of ideal climatic conditions.

Many have actually paid for their land with the proceeds of the first year's crop. Cash rentals range from $20 to $50 per acre.

Note these Points of Superiority

Soil Unequaled
A silt soil, fertile as the Valley of the Nile, hundreds of feet in depth, deposited through centuries by the mighty Colorado River.

Water Abundant
A safe, sure, adequate, permanent, cheap water supply, coupled with a perfect drainage system. With every acre-foot of water is applied to the soil nearly 10 tons of soil renewing silt.

Markets Exceptional
A tremendous and growing Eastern demand for winter vegetables and fresh fruits. Los Angeles, San Diego and other adjacent communities constitute an ever-increasing market.

Climate Favorable
A growing season of 365 days a year, with an unexcelled winter climate. Everything is ready for market six weeks to two months earlier than from other sections.

Scaly Bark Demonstrations

By Ernest Braunton

THE Los Angeles County farm bureau, in common with other county bureaus in citrus growing districts, is at this time of the year holding orchard meetings to demonstrate the best procedure in the treatment of scaly bark on the orange. This is a disease not confined to any district or districts, but somewhat prevalent wherever heavy soil is found and to a lesser extent is due to other causes.

Farm Adviser Hodgson, speaking at Monrovia recently, called attention to the differences between the gum disease, or gummosis and scaly bark. "We know more about the gum disease and its presence is more easily detected, for the tree attacked exudes large quantities of gum and the disase acts to kill the bark. The brown rot gummosis is very bad on lemons in some districts and worst on heavy soils, but some stocks are more susceptible than others, the sour stock of the orange being most resistant. The most common point of attack is at the union if it be at surface of soil. For that reason it is better to bud high, six or eight inches above the ground. If trees are budded low keep the soil away from the union. If the attack is bad trees may be killed rather quickly. The soil should be pulled away, the dead bark cut away and the trunk and upper roots painted with Bordeaux paste.

Scaly Bark

"This trouble is caused by an unknown agency. It is thought to be bacterial, but we are not sure. It does not kill the bark, at least not until in the last stages. It is not easy to detect and often is unsuspected until trees show signs of malnutrition.

"It attacks orange and pomelo, but is not so bad in the latter and the Valencia is slightly more susceptible than the Navel. The first stage shows but droplets of gum and the area affected is no larger than one's hand. At this stage we can cure all cases, but as the disease progresses steadily, we should get at it as early as possible. But the progress is usually very slow and a close annual inspection should be made of every orchard to determine its freedom or infection.

"The second stage is considered as that where the affected area ranges larger than one's hand and the effects are plainly visible on the exterior of the tree. In this stage we can control two-thirds of the cases or so prolong the life of the tree that several good crops will result. For any organism so attacked makes a supreme effort to reproduce itself, and the orange is no exception to the rule, even though it be a seedless orange. But prolonging the life of the tree, even though it later succumbs, will well repay the effort. In the third stage, where the tree is manifestly decadent, it is of little use to do anything, as it is past help. A few trees go quickly, in three years; others last for ten years.

Treatment

"The treatment is nothing more or less than good tree surgery, as with diseases caused by fungi. Cut out all diseased tissue, keeping all tools disinfected that are used on affected parts. Then paint all diseased parts with Bordeaux paste. This is the cheapest and most durable material and should be renewed once a year. In the second stage we do not cut away the bark as in the first stage as the bark is not killed and we do not wish to destroy so large an area. So we merely scrape the bark down to the "quick" and give it what we call the Fawcett treatment. I use a five per cent carbolic acid solution and find it best. Trees so treated years ago by Dr. Fawcett have been restored to their former vigor. Carbolineum and creolinium are also used but are less effective as the carbolic acid content is variable, but creolinium is better than in former years. There are also various mixtures on the market, prepared by paint and oil companies, some of which are very good. Then treat with a Bordeaux paste. In some sections scaly bark is increasing in virulence, attacking the youngest trees and killing them quickly. Old lemons shed their bark in a suspicious manner and while there is no danger it is best to clean off the roughness and spray with Bordeaux, for other diseases or insects may be encouraged or harbored."

Mr. Hodgson and Assistant Adviser Blanchard then treated an affected tree to show how the work should be done and what tools have proved most effective and convenient. The assemblage was then invited to another part of the orchard to view a lemon tree badly affected with Armillaria meliea, the oak root fungus, and hear a short talk on same. The audience was one more than ordinarily interested and inquiry developed that all were members of the farm bureau.

ORANGE TREE INSPECTION

There is a fine feeling of cooperation manifest between quarantine officials and the nurserymen in nearly all parts of California. An instance has just come to our attention. Tulare County has a restriction which forbids citrous trees entering unless defoliated. Recently growers in Los Angeles and San Bernardino Counties had five carloads to ship into Tulare County. Defoliation is expensive and there is no question but it impairs the vigor of the tree. So sure were these growers that their stock was absolutely clean that they asked Horticultural Commissioner Collins of Tulare County to come down at their expense, examine the trees, and they would abide by any decision or ruling he would make. So he sent F. R. Brann, his chief deputy. Mr. Brann spent two days examining the stock, found it clean, but had the bases of the trunks scrubbed down into the soil, the trees then dipped, and passed them for shipment. He stated the stock was not only clean but as fine as any he had ever seen. In his county the gray scale is the only one that seriously affects the trees; black scale will not thrive there and the red scale has never been allowed to enter.—E. B.

THE CONSERVATION OF MANURE

(Continued from Page 330.)

order to thoroughly mix the manure and the peat. It is also sometimes necessary, particularly in our dry seasons, to water these heaps. The composted manure is exceedingly valuable for potted plants, green houses or other similar purposes but it is extremely doubtful whether or not it is as profitable for use in citrus orchard soils as is the fresh manure or that from manure pits.

Of course the value of the manure from the different classes of animals depends upon several factors, including the feed which is given to the animals, the age of the animals and the care with which it is handled from the feed lot to the orchard.

* * *

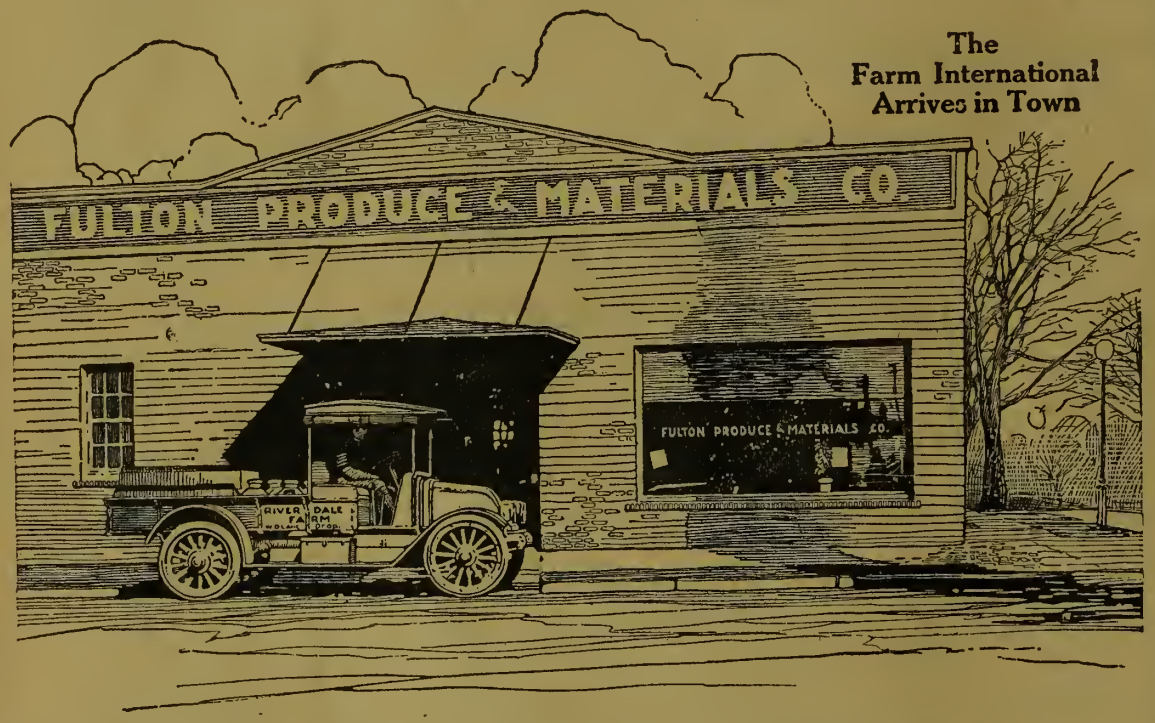
Methods of application, with especial reference to the furrow-manure method, will be given in a later issue.

TO PAINT NEATLY

Many do a good deal of their own painting, interior and exterior. An amateur painter cannot avoid getting some paint on the hardware, such as locks, hinges, handles, pulls, etc. This gives the finished job a botched appearance and partly spoils the effect of the new coat of paint.

Here is a little trick of the painter's trade that will serve the amateur painter well. Before beginning to paint the woodwork apply a coating of vaseline to the hardware; let the paint dry thoroughly; then wipe the vaseline off the metal parts and the paint will come off with it. This insures a neat, clean job of which the painter may be proud.

The required number of signatures to petitions in the Fresno irrigation district for the Pine Flat project has been obtained and filed with the board of supervisors. The petition contains 750 names, representing an acreage with an assessed valuation of $4,326,990.



To the Tractor-Owner:

YOU know the value of power in the saving of time, money and labor on the farm — provided you have the right tractor.

If you also own an automobile, you have learned what a wonderful time-saver this form of power is in making quick trips to town and getting around the country.

You will readily appreciate, then, the great value of a motor truck as a saver of hours, dollars and work on the farm, for it combines the heavy-duty utility of the tractor and the distance-reducing responsiveness of the motor car.

International Motor Trucks, which are made in five capacities — ¾, 1, 1½, 2, and 3½-ton — are particularly adapted to farm use because of their sturdy, rugged construction and powerful engines. They are entirely *factory made* at the Harvester Company's plants — *not assembled* — and are made with the same care and regard for quality and service as McCormick and Deering haying and harvesting machines, with which you are familiar. Harvester Service is always available through the 92 International Harvester branch houses, conveniently located, which serve thousands of local dealers.

Do your hauling with International — the truck that "goes where the going is hardest." Write your name along the margin of this advertisement and mail to us so that we can send you a folder that will give you a faint idea, at least, as to how good-looking and good-working **International Motor Trucks** really are.

International Harvester Company of America

Install Lalley Light Now

Farmers are installing Lalley Light ***now*** in greatly increased numbers.

They realize more than ever that ***right now*** they have plenty of time to install this essential equipment.

They realize that they can have Lalley benefits and comforts ***immediately*** and be ready for the greater benefits that Lalley Light will give them when the rush of farm work comes.

They realize that Lalley Light, with its ten-year owner experience, is so valuable an investment that they cannot afford to be without it one day longer.

Delay May Be Costly

Right now is the best time for you to begin enjoying Lalley electricity. Not only do you need this equipment ***now,*** but if you delay, you may have to pay an increased price for it.

Do not delay. Go to see your Lalley Light dealer ***now*** and place your order for a Lalley Light Plant to be installed immediately.

LALLEY LIGHT CORPORATION
774 Bellevue Avenue Detroit, Michigan

LALLEY LIGHT CORPORATION
963 Pacific Bldg.,
San Francisco, Cal.
F. C. Morris, Manager

Lalley Light is a complete unit—engine and generator—with 16-cell storage battery. It supplies ample electricity for lights, water pump, washing machine, sweeper, cream separator, fanning mill, iron, etc.

December 1st, 1919.

The Feldman Farm Electric Co.,
426 - 2nd. Ave.,
Spokane,
Washington.

Dear Sirs:

In answer to your enquiry about my Lalley Light plant, I wish to say that it is running to my entire satisfaction. In fact, I had no idea when I bought my Lalley plant three years ago that any piece of machinery could run as much as I have run my plant and stand up.

I use my plant to light my store and garage and for charging automobile batteries. Day after day I start my plant at 8 O'clock in the morning and do not shut it off until 10 O'clock at night. It is safe to say that I have run my plant on an average of eight hours a day since I bought it about three years ago.

I see about 400 watts of current continuously for lights and have been doing this for three years.

The Tillard battery that came with the plant is in first class shape now. There is very little sediment on the bottom showing that they are lasting fine.

The Lalley should last a farmer who gives it reasonable attention a great many years. My plant has certainly been a surprise to me.

Sincerely yours,

C. N. Cederblom

LALLEY LIGHT

THE ELECTRIC LIGHT AND POWER FOR EVERY FARM

Agri GYPSUM

For greater crops of oranges, alfalfa, potatoes, beans, garden truck, deciduous fruits, cotton, beets, cover crops, and barley apply AGRI GYPSUM to your land.

It supplies sulphur, an element contained in most farm crops to an extent almost as great as phosphorus which aside from nitrogen has been considered the main limiting factor to crop production.

Gypsum contains two of ten essential elements for plant nutrition,—calcium and sulphur.

It is not new, it was introduced in Europe in 1768. Benjamin Franklin was the first to advocate its use in America and soil experts everywhere advocate its use in the production of the above named crops and many more.

Potatoes respond quickly and vigorously when AGRI GYPSUM is applied.

If you have land that is saturated with Black Alkali, proper application of AGRI GYPSUM will change the elements of this substance so that valuable crops may be produced thereon. Authoritative proofs of successful experiments by official agencies will be furnished establishing this important fact.

This year when fertilizers are scarce and high we invite you to investigate carefully the importance and economy of using AGRI GYPSUM.

If your dealer cannot supply you write.

United States Gypsum Company
(Sole Manf'urers of AGRI GYPSUM)

Notice to California Prune and Apricot Grower Members

Following is an exact copy of the form of notice going forward by registered mail to all growers under contract with the Association, exercising the Association's option on the prune, apricot and apricot pit crop of the season of 1920 and 1921, in accordance with the terms of standard fruit agreement entered into by all members:

John Doe,

San Jose, Calif.

Dear Sir: The California Prune and Apricot Growers, Inc., herewith exercises the option heretofore granted by you under the terms of the Prune Crop Agreement, made by and between you and the California Prune and Apricot Growers, Inc., on the ..... day of ..... 19 ..... to purchase the crop of 1920 and 1921 produced on the lands described in said Prune Crop Agreement at the terms and under the conditions of said Prune Crop Agreement, and the California Prune and Apricot Growers, Inc., hereby notifies you that said Prune Crop Agreement, and all the terms thereof, will be in full force and effect by virtue of the exercise of this option during the years 1920 and 1921.

CALIFORNIA PRUNE AND APRICOT GROWERS, INC.,
By H. C. Dunlap, Secretary.

Dated February 2, 1920.

INSTITUTE WITH PERMANENCY

(Continued from Cover Page)

of stocks. Bud selection has been drilled into our minds until it has become an established principle that like begets like in bud-wood as well as in seeds, and now the character of the sotck on which the bud shall be placed is declared to have a large influence on the resulting tree.

This discussion was started by the address of Dr. Webber, which was along lines followed by the doctor in Bulletin 317 of the College of Agriculture Experiment Station, "Selection of Stocks in Citrus Propagation."

One peculiarity of the institute was the absence of resolutions. Producers in conventions assembled have hard work getting by without resoluting several times. This convention was sans resolution committee. However a motion commending Dr. Herbert J. Webber for the services he has rendered to California horticulture and wishing him greatest success in any future work was passed by every member of the convention standing.

The Program

J. E. Rich, vice president of the Orange Show, welcomed the delegates in place of President R. E. Swing, detained by official duties. To this address no response was made, Dr. Webber stating that the attendance sufficiently showed the appreciation. The first number on the program was a paper read by T. R. Woodbridge, Upland, on Cooperative Grove Organizations. This was largely a review of the first year's business transactions of the Liberty Groves Operating Corporation, Upland; the chief points of which, as in the case of all papers read, will appear in this or future issues of the Cultivator.

The next was a broadly analytic paper by J. D. Culbertson, assistant manager of the Limoneira Company, Santa Barbara, entitled Housing of Ranch Labor, but going far beyond the title in an enlightening review of present ranch labor conditions. This was followed by a paper by Prof. R. S. Vaile of the citrus experiment station, Riverside, on Trend of Development in the Citrus Industry. Prof. Vaile presented charts to show the increased cost of production this year as against former years. In the season of 1913-14 lemons cost 90 cents a box to produce up to the point of picking. In '18-'19 the cost had risen to $1.30, this in spite of improved methods of handling, improved farm machinery, etc. For the same seasons the cost of a box of oranges increased from 50 cents to 85 cents. During the same seasons the field operations per acre had advanced from $197 to $300 for lemons and from $136 to $175 for oranges. The net returns per acre were $58 in '13-'14 and $150 in 1918 for lemons (the highest return was in '17-'18, of $258 an acre). In oranges the returns ranged from $58 to $150. In the season of '14-'15 the net loss per acre on lemons was $63.

More mixed farming was advocated, especially the raising of livestock to supplement the lessening supply of farm manures. These products should doubtless be handled on a cooperative marketing base as is the case with citrous fruits. In production of oranges for the state for the season of '16-'17 the number of boxes of Navels was 13,270,000; Valencias, 5,020,000; in '18-'19, Navels were 7,677,000 and Valencias 6,780,000.

While influenza makes a strong call for lemons, since prohibition of intoxicants the demand is very strong for more orange drinks, so the orange end looks a little the more encouraging. The outlook for 1920 demand for nursery stock shows lemons, Navels and Valencias about equal.

The State's Experts

W. H. Fleet, manager of the Rancho Sespe, near Sespe, Ventura County, gave a talk on Are We Using the University and the Experiment Station As We Should? He said that in an audience of 60 ranchers in his section but four were receiving the university bulletins. At considerable trouble he obtained a noted speaker on the one subject of most importance to the people of the district. One hundred and thirty post cards were sent out ten days before the meeting and again two days before, yet the attendance was but 35. All connected with university work are anxious to help you, but do not wish to thrust themselves upon you; send for them. Get together so you can call experts on dates agreed to by the community so the greatest number possible may be reached upon each visit. Ranchers asked about visits to the experiment station said they had no time, yet they took many hunting, fishing and pleasure trips. When sick they send for the doctor, often at a heavy cost, yet when orchards are sick they fail to avail themselves of the services of expert specialists, without cost. All should work to obtain more money from the state for the support of these necessary stations and experiments.

In the afternoon Dr. H. J. Webber, director California agricultural experiment station, Berkeley, gave a talk on The Selection of Stocks, but stated the talk was just what may be found in his latest bulletin, heretofore mentioned.

Following Dr. Webber came a talk by C. S. Milliken of the California Fruit Growers Exchange, on Bud Selection and Nursery Methods. He recently wanted a George IV peach for trial but could not find one that the nurseryman knew for certain, personally, was true to name, and was pleased that the nurserymen in deciduous fruit tree operations were combining to secure by cooperation what they long had wished to furnish their patrons—assurance of trees being true to name. One 15 acre young orchard bought for a "pet" grove by a wealthy retired business man proved not to be Washington Navels and will now be budded over. One 50 acre lemon grove cited has 15 acres near the middle that has never borne, though the trees are evidently Eurekas. Now it is the practice of all good nurserymen to get buds only from trees of known or certified crop production. Unselected stock should not be allowed to be offered for sale as it injures the industry. Such cheap stock is bought by promoters who plant orchards for sale only, and the practice shuld be stopped. Public opinion will finally force all dealers to handle only the best stock obtainable.

Planting the Orchard

F. H. Nusbickel, Glendora, read a paper on Planting Citrus Trees, followed by W. M. Mertz, of Alta Loma, on the closely allied subject of Handling a Young Orchard, of which more will appear later. Mr. Mertz urged double cover cropping for districts where humus was much needed and where plenty of water is available for summer use. Cow peas planted in the middle of May is a good summer cover crop. Such crops in rows take less water and their cultivation is beneficial to young orchards for the first and second year.

The Fertilizer Situation was treated in a brief talk, bristling with statistics, by A. E. Barnes of the Fruit Growers Supply Company. Before the war we obtained potash in large quantities, though scientists stated little was needed, and later experiments and practice have proved they were correct. Phosphorus we get from acidulated bones and phosphate rock. Bones from Calcutta, the greatest source of supply, now cost $62 a ton and raw bone is quoted in San Francisco at $75 a ton. Bone meal is necessary for sugar refining and the orchardist has these interests to compete with when seeking a supply. Labor shortage has seriously interfered with the mining of phosphate rock and the government took all available sulphuric acid during the war. Its production was increased 2,000,000 tons in war time but much is needed for refining of oil and this interest competes with the farmer. Nitrogen was needed for explosives during the war and for five years European lands received none. Now they need it and we must grant it. France and Belgium have placed orders in Chile for 500,000 tons. Before the war Germany was Chile's best customer. Now she buys none. Just what her source of supply is we do not know, but she will doubtless purchase no more abroad. A new process for refining nitrate of soda is now in use in Chile which will reduce the cost by one-third over the old method. The United States built an ammunition plant on the Atlantic Coast at a cost of $70,000,000. It covers 38 square miles. It will now, through an enabling act recently passed, convert ammunition into fertilizers. The farmers of the world are, however, bidding for supplies against some of the world's biggest industries and there will be no surplus during 1920 or spring of 1921. During the summer of 1921, Mr Barnes thinks, a surplus of nitrogen should be available.

The next paper, by A. D. Shamel of Riverside, appears in part in this issue, and he was followed by Joy G. Jameson of Corona, on What We May Do to Increase the Future Supply of Organic Matter, and Dr. I. G. McBeth of Whittier on Use of Cover Crops in Citrus Orchards. The Important Fungus Diseases of Citrus, by Dr. Barrett, acting director of the Riverside citrus experiment station, has appeared in recent issues of the Cultivator. This was followed by a paper from Prof. H. S. Smith, state department of agriculture, Sacramento, on The Use of Parasites in the Control of Mealybug and Other Citrus Pests, and then a brief talk on Fumigation Methods in Control of Citrus Pests by Prof. H. J. Quayle of the citrus experiment station, Riverside.

The latter said the last three years had recorded a marked advance in fumigation through the use of liquid gas instead of the now nearly obsolete pot method. The purity of liquid gas has now been standardized so it is comparatively safe to use as 95 to 96 degrees of purity brings excellent results, while a purity of 98 or 99 gave too volatile a product. He said the red scale at Corona, (due no doubt to superior climate) was the hardest to kill of any yet found. The intimate study of control of this one pest by the new methods began in 1915 and a new series again opened in April, 1919, and will be continued and final results given to the public.

Five seasons' observation prove red scale to be most resistant on heavy leaved Lisbon lemons. One curious fact was brought out, that of a certain number of live scales placed under a treeless tent, ten per cent more were killed than in a like number placed under the same tent when containing a tree. The red scale is more resistant on fruit than twigs. The navel orange is no problem for the fruit is picked soon after fumigation season, but with Valencias, lemons and pomelos the fruits may become reinfested before harvest, for the scale hatches at all seasons and April and May are the best months for fumigation, and a practical cleanup may then be accomplished. Fumigation in the Corona district was very effective in 1919 for the work was done at the right time, when there were fewest numbers in the most resistant stage, which is in adults and at time of second molt. In general daylight fumigation it was found light and temperatures were the factors controlling injury to trees. In many sections December, January and February are the most satisfactory months, for when temperatures are above 70 degrees in September, October and November, injuries resulted, while 89 proved safe in winter. The injuries are most marked by the dropping of leaves on the south side of tree. But the same dosage is more effective by daylight than by night. We should reduce dosage rather than time of exposure as dosage is the most costly. There is danger of injury to the blossoms of Valencia, very little to navels, and no danger to lemon blossoms.

The Hot Air

Dr. H. S. Reed of the citrus experiment station read the last paper on the program, prefacing his remarks by saying that Dr. Webber, evidently with studied intent, had reserved the hot air for the last, but if it was characterized by velocity, it would at least be brief. His subject was: Observation on the Damage Caused by the Local Windstorm of November 20-23, 1919.

He said the velocity of this wind was from 50 to 60 miles an hour and it came over the mountains from the Mohave Desert. The most marked matter of temperatures was the high minimum, the nights being hot and dry. The main direction was north and then northeast and the velocity in sections damaged was from 25 to 40 miles an hour. The great factor in injury was no doubt the low relative humidity. Orchards in light soils suffered less than those in heavy soils as water movement is more responsive in the light soils. Windbreaks were effective in protection only to trees close by and those enclosing ten acre blocks were not sufficient to protect whole blocks of that extent.

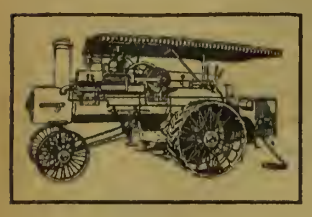
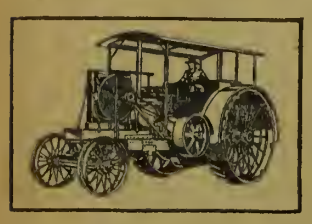
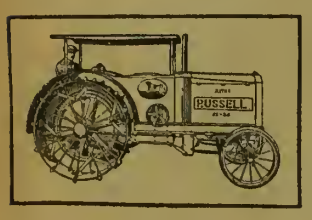
RUSSELL
THE OLD RELIABLE LINE

Tractors That Stand Up







Ever since Russell built the first American tractor in 1875, Russell has steadily adhered to this policy:

Firstly to build with only true and tried features, and complete all our own experimenting before letting our machines get on the market.

Secondly to use only the best of materials and standardized units; to put in hand-made quality of workmanship; and to build for hard, long service, not *how many* machines but *how good*.

As a result, Russell stands for Reliability in kerosene tractors, just as it has always stood for Reliability in engines and threshers all over the world.

With crops bringing record prices and farm labor scarce, you cannot afford to risk breakdowns and delays that go with new and unproven machines. *Avoid experiments*, keep farm work going right ahead; buy a proven, sturdy old reliable Russell and make your farm pay bigger than ever this year.

Complete Line of Tractors and Threshers

There is a Russell tractor and a Russell thresher for every size farm. Kerosene tractors are in four sizes: 12-24, 15-30 and 20-35, and the Giant 30-60. Steam traction engines are made in five sizes. Threshers in six sizes, from 20x34 for individual farm use, to the big 36x60—all alike in general design and exclusive features.

Fully described in big new Russell Catalag—send for it.

PLANT
Fruit Trees

WE SPECIALIZE ON FRUIT-BEARING TREES

We grow our trees in the choicest spot in California. Here in Central California the most favorable climatic, soil and water conditions prevail, making possible the production of superior trees and vines. Added to this is our intimate knowledge of the business which enables us to exercise the most intelligent care in growing and handling nursery stock.

You should have our catalogue. Our descriptions of varieties are more complete and comprehensive than in any other book. This book tells you what you ought to know in order to select trees intelligently. Sent free on request.

USE OF COVER CROPS IN CITRUS ORCHARDS

(Continued from Page 329.)

and if there were no other method of supplying organic material to citrus lands, the fertilization problem of the citrus grower would indeed be a most difficult one.

Fortunately one of the most satisfactory methods of maintaining the organic and nitrogen content of citrus lands is by means of green manures, or cover crops grown in the orchards. Cover crops should be grown extensively during the winter season and in some sections it is believed that two crops per year can be grown to advantage. In new plantings, situated under conditions which make it possible to grow two green manure crops per year, the organic and nitrogen requirements of the land can undoubtedly be taken care of without additional fertilization during the first ten years.

In growing green manuring crops, we are of the opinion that legumes should be used exclusively. From the standpoint of tonnage, rye and barley may be expected to give good yields in time for the spring plowing; but they are not nitrogen gathering crops and are apparently much inferior to legumes for maintaining the productiveness of the land. We have a number of legumes which make a fairly satisfactory growth when used as cover crops in Southern California. Of these, melilotus indica appears to be the most promising of the winter varieties. For summer growth, perhaps the whippoorwill cow pea is best. Purple vetch possesses distinct advantages over melilotus in that it is a much larger seed and makes a much quicker growth, is less likely to be smothered by weeds and is more certain to give a heavy tonnage in time for early spring plowing. But there is as yet no seed available in commercial quantities. The main disadvantage of the whippoorwill cow pea seems to be that the planting must be delayed until spring is well advanced and the ground thoroughly warmed up before the young plants will thrive. A crop which could be planted earlier and which would make sufficient growth to cover the ground before the hot summer weather comes on would have a distinct advantage over the cow pea, and it is believed that if such a plant could be secured the summer cover crop would be grown with much greater success and far more extensively than in the past.

Many failures to secure satisfactory results with green manuring crops are due to too little care in preparing the seed bed or in protecting the crop when young. The carelessness exhibited in growing a cover crop is probably due to a general lack of knowledge of the real value of such crops which results in the owner attempting to get by as cheaply as possible.

In citrus groves in which cover crops are growing it is generally considered good policy to plow early. Ordinarily the spring plowing should be done during February or March. A good yield of winter grown legumes cannot ordinarily be expected in less than five months. Thus it is important that the seed should be sown in sufficient time to permit the development of the crop before the plowing season. Melilotus sown on lands upon which rapidly growing weeds develop must be protected from the smothering effect of weed growth. This can be accomplished at little cost by running over the land with a mower when the weeds have attained considerable height.

The amount of seed to sow will of course vary with conditions. The cost of the seed is not a very large item and it has been our experience that it is better to sow too much rather than too little. In young orchards where practically all the land is sown it has been our practice to sow 30 pounds of melilotus and 40 pounds of cow peas. In old orchards where about one-half the land is available for cover crop, only about 15 pounds of melilotus seed has been used.

The preparation of a good seed bed, especially for the small seeded cover crop species, such as melilotus, is very necessary in order that good germination may be secured. On all except very heavy soils, a good method with melilotus is to broadcast one-half the seed on the dry soil before furrowing, then harrow lightly, furrow out and broadcast the other half of the seed over the furrowed land. On very heavy soils, especially under climatic conditions causing slow drying of the surface soil after irrigation, good results may be secured by broadcasting all the seed after furrowing.

The most successful method with cow peas and other plants having relatively large seed, is to first secure a uniform irrigation of the land so that all the soil is thoroughly moistened, then follow as soon as possible with harrow and cultivator in order to establish a good seed bed. As soon as the seed bed is complete, the seed should be drilled to the proper depth. The rows should be from 28 to 30 inches apart. On soils which need not be irrigated for three or four weeks after planting, the furrowing should be delayed until required for the following irrigation.

The question of irrigation for the young crop is very important. After the seed is sown and the seed germinated, the success of the crop depends largely upon the moisture conditions of the land. Therefore after seeding, sufficient water should be available to keep both trees and cover crop growing normally. Since the rains cannot ordinarily be depended upon to supply the necessary moisture until December and often much later, careful attention must frequently be given to the irrigation of the land for some months after the seed is sown. Perhaps more failures to secure a successful cover crop are due to poor soil moisture conditions than to any other cause.

In order to get as much tonnage as possible, it has been the practice of some growers to allow the crop to approach maturity by delaying the spring plowing. While it is desirable to grow all the organic matter possible in our groves, the practice of delaying the plowing operations in order to secure greater tonnage is, in the opinion of the speaker, very poor practice and should be discouraged. The turning down of the succulent green plants within easy reach of the feeding roots of the tree in the early spring not only furnishes a quickly available supply of plant food but makes it possible to put the land into proper physical condition before the beginning of the irrigation season. Delayed plowing, especially on cover cropped lands, is likely to be disastrous to the following crop of fruit and should not therefore be practiced unless the larger yield of green manure is of paramount importance.

As stated above, the carelessness with which the cover crop problem is handled by many growers is probably due in large measure, at least, to a lack of appreciation of their real value. From the standpoint of nitrogen fixation alone, the citrus grower can well afford to spend considerable effort and money to secure a satisfactory crop.

Many experiments are reported which show the remarkable effect of green manuring crops, if leguminous varieties, in rendering productive barren and worn out lands. Very large areas of barren sandy heath land in East Prussia have been reclaimed by a system of growing lupine and plowing in the green crop. It is reported that a barren soil planted to lupines in 1865 was found in 1880, or after 15 years of lupine growth, to contain 2,600 pounds of nitrogen in the surface eight inches, as compared with 800 pounds in an adjoining field in which no legumes grew. The gain in nitrogen amounted to considerably more than 100 pounds per year. Experiments reported by the Rathausten station, in which a worn out soil was abandoned to wild vegetation for 25 years, show an annual accumulation in nitrogen of more than 100 pounds per acre.

Young orchards on the Leffingwell Rancho cropped to melilotus indica as a winter crop and whippoorwill cow peas during the summer, showed an increase in nitric nitrogen of more than 100 pounds per acre after two crops of melilotus and one crop of cow peas bad been added to the land.

From experiments conducted at the citrus experiment station, Mertz reports that legumes alone gave as good or better results than non-leguminous green manuring crop plus an annual application of 540 pounds per acre of nitrate of soda.

Many other experiments might be cited to show the value of leguminous crops in adding nitrogen to the soil.

The quantity of organic matter which may be added by a cover crop

depends uopn tho tonnage produced and the stage of maturity of the crop when plowed down. If turned down when still quito green, the water content may be as high as 80 per cent. A small percentago of the solid matter is made up of the mineral elements taken up by the plant, which leaves somewhat less than 20 per cent of the total weight produced as organic matter. As stated above, the organic content of the ordinary run of animal manures sold to citrus growers is frequently no more than 20 per cent, which would seem to indicate that the organic matter added to the land by turning down a green manuring crop of 20 tons would be equivalent to the application of 20 tons of manure.

Assuming that a cover crop of ten tons can be grown with reasonable certainty and that the nitrogen saved from the leaching action of heavy rains or gathered from the air amounts to 50 pounds, which many experiments on record would indicate is quite possible for a crop of this tonnage, at the present price of nitrogen in quickly available substances, in which class green manures should be placed, the value of the nitrogen alone would amount to approximately $25 per acre. When we add to this the value of the organic matter, which in the opinion of the speaker would have a value of at least $10, we have a total value for the crop amounting to $35 per acre. During favorable seasons, if properly handled, the crop should yield a much higher tonnage with a corresponding increase in value.

SULPHUR FOR FERTILIZER

Owing to more general interest in the use of sulphur for fertilizing we recently asked Dr. Snowden as to what is the best form in which to apply sulphur. Dr. Snowden writes:

"I have found finely ground gypsum all round the best form of sulphur for agricultural purposes, but local conditions will of course modify this opinion. For instance, where there is plenty of calcium carbonate in the soil or it can be added cheaply, and the land is a long way from the gypsum supply, the element sulphur would probably prove of advantage to use but is slower in its action because it must become oxidized to the sulphate before it can be used. This too must be done perhaps at the expense of the oxidative efficiency of the soil which would tend to diminish fertility since oxidative power of a soil is sometimes its index of fertility, in other words its limiting factor. For a soil deficient in sulphur I would always advise from 1,000 pounds to a ton of gypsum per acre, though of course, less might do. I have known an application of a ton of gypsum per acre on oranges to be followed by the production of a 65 per cent crop while the adjoining groves produced but a 15 per cent crop."

A BELIEVER IN THE FARM BUREAU

By J. P. Samuelson, State Land Settlement, Butte County

Just a line to give my opinion on the farm bureau. I believe the farm bureau the best medium for bringing the farmers of this country together in a big political and social organization. I think if any industry needs organization it is the farmers, for they have the greatest investment in their business, employ the greatest number of laborers, and constitute almost half the population. If organized they can control the food needed for both capital and labor, and if necessary could put on the most terrible strike the country has ever seen. But this should not be the plan; all that is asked for is fair play from the public. If organized, the farmer will then be invited to attend every industrial conference because he will be recognized as having strength.

Shipments of food from foreign countries, such as beans from Japan and China, could be stopped as long as our own crops lie in warehouses and cannot be sold. Profiteering can better be controlled—for example, the selling of bacon at 60 cents per pound when the farmer receives only ten cents per pound for hogs.

The laboring man with not a cent invested can go to Washington, D. C., and put his demands in the hands of the President. The farmers, owners of half the country, can go nowhere to demand adjustment. The reason is, they are not organized.

For that reason let us organize and help the government to run the good old U. S. A. and do our part. We can, and should, use the farm bureau for this work.

SULPHATE OF AMMONIA

Crops in California are often stimulated, or rather given greatly increased production, by application of small quantity of quick acting fertilizers. Those which show quickest return are usually rich in nitrogen in some form. One of these nitrogen suppliers which is quite generally used is sulphate of ammonia, a waste product secured in the manufacture of coke. Sulphate of ammonia yields its nitrogen very quickly, but in order to do this the ammonia must be changed by the action of the soil. This change comes at a soil temperature of 41 degrees and increases in rapidity as the soil gets warmer. Some growers have felt that there was danger because of acidity which might be created in the soil by the use of this substance, but unless there is natural acidity it is hardly possible. In any case the application of finely pulverized limestone or of lime will entirely correct this condition. One hundred pounds of sulphate of ammonia often contains as much as 21 pounds of nitrogen. In addition to the nitrogen value there is an opinion quite general that the content of sulphur is also of value to the crops. For citrus fruits an application of from 300 to 500 pounds per acre of full bearing trees is recommended. This should be applied in several installments.

MAKES MONEY WITH CANNING OUTFIT

Two boilers fitted with trays, two tubs, two wire baskets, two paring knives, a small dipper, a measuring cup, a kettle, and a can sealer comprised the equipment that a young Washington school teacher used to can enough peaches to clear $600 in two weeks last fall.

In the Yakima Valley, Washington, there is a high percentage of waste peaches in the orchards that supply the commercial canneries. It is impossiblo for them to use tree ripened Elberta and Slappa peaches because they will not stand up well under the high pressure used in processing. A young school teacher and her aunt, living in the vicinity of these orchards, decided, with the advice of the home demonstration agent of that county, to utilize these tree ripened peaches. With a stove made of bricks and the above equipment they were able in two weeks to make a profit of $600. They found little sugar was necessary with the tree ripened peaches. They also made 600 quarts of peach and pear conserve and 215 quarts of grape and apple jelly. Special recipes were worked out for the pear butter.

FUMIGATION

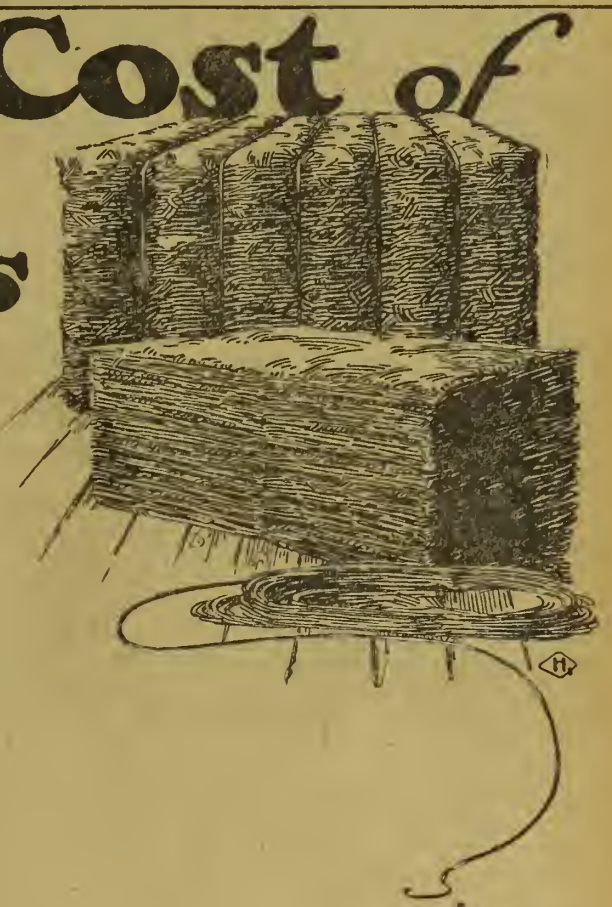
Commissioner Ryan of Los Angeles County reports that 57 per cent of Los Angeles County's commercial citrus acreage has been fumigated during the past season. There are about 47,000 acres of bearing orange and lemon trees in the county.

On February 1 a total of 26,035 acres had been fumigated. Reports from the 18 citrus inspectors' districts show close to 1,000 acres that will be fumigated before the close of the season. Thirty-two crews were still in the field at that time. Liquid H. C. N. was used on all but 200 or 300 acres.

Reports from district inspectors indicate the general results to have been more satisfactory than ever before. Certain orchards in the North Whittier Heights section still produce an off-hatch of scale that interferes with regular fumigation, but this condition seems to improve as the trees grow older.

The moment you depend upon someone else your strength weakens.

Save the Cost of Grain Sacks



GRAIN SACKS are an absolute loss no matter which way you figure it; you lose, the buyer loses, the shipper loses.

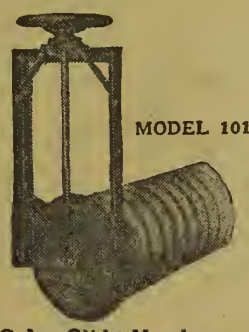
You lose two ways. You lose the money you pay for sacks, for there is only a partial return for this outlay. You lose the grain that is always wasted when you use sacks—through leaks, weather and rodents.

Turn this total loss into profit by handling your grain in bulk. Substitute the inexpensive, economical Calco Metal Grain Bin for the costly, wasteful sack.

Built once, these bins handle your grain for years. They do not have to be replaced every year as sacks do. They quickly pay for themselves. Check and mail the attached coupon for the Calco Grain Bin Booklet.

Calco Automatic Drainage Gate—Model 100

Opens automatically with slight pressure and closes instantly when pressure ceases. Made from cast iron with shutter suspended by means of heavy steel bars. Send for list of sizes and prices.



MODEL 101

Calco Slide Headgate

Designed for use under varying heads of water up to twenty feet. Strongly made from cast and angle iron. Operation of slide is easy, quick and positive. Write for information.

Armco Iron Lateral Headgate—Model 153

Designed to serve as inlet gate under varying heads of water up to six feet. One of two models. Truss plate riveted across face materially reinforces it. Operation of slide is both rapid and easy. Catalog upon request.

Armco Iron Irrigation Gate—Model 161

Made to control the flow of water through the bank of a ditch or stream. Easy to operate and water-tight. Gate Slide is built into it. It comes with or without collar or bulkhead. Send for descriptive folder.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The boycott didn't work. The labor union declared against the Orange Show and doubtless caused some loss. The program came off according to schedule, and this includes the glorious rain which was visted upon it during the last three days. We say, according to schedule, for we believe that only once or twice in the last ten years has the National Orange Show been pulled off without the biggest storm of the season occurring during that week. It was a glorious storm; it was a fine show. One little corner of the main tent is shown on the cover this week.

PAINTING BY SPRAYING

It has long been the custom to whitewash, especially the inside of poultry houses, barns, big warehouses and sometimes factories, by applying the wash or paint by the use of spraying machines. This has meant a very great saving in labor and far greater efficiency in the application than was possible by the use of a brush.

The labor union has protested. Now comes the announcement that "The State Conference of Journeymen Painters" is to be held in Bakersfield March 13 and 14 and the daily press chronicles "the conference is expected to go on record in favor of legislation prohibiting the use of spraying machines or so-called 'paint guns.'"

Anything to make everything cost more seems to be the determination of labor—some labor.

GEORGE E. MERRILL

Sonoma County's farm adviser, George E. Merrill, died at Santa Rosa February 8. Mr. Merrill formerly lived in San Jose, was a graduate of Stanford, acted under A. J. Cook as chief deputy horticultural commissioner, and was secretary and executive officer of the organization committee of the California Prune and Apricot Association. More recently he has been farm adviser of Sonoma County. He is survived by a wife and two children. Mr. Merrill will be missed in horticultural circles of the state for he has been a factor in its advancement.

NO DROUTH IN IMPERIAL

We suppose Imperial Valley has about as dry a situation as there is in the United States. By "dryness" in this connection we are referring purely to lack of rainfall. But notwithstanding the drouth which usually prevails in the clouds above the valley, the clouds above the Rocky Mountains, some hundreds of miles distant along the headwaters of the Colorado River, give up their wealth and the river channel conveys it to the rich lands below sea level. Engineers have made investigation and predict a larger flow than usual in the Colorado River the coming summer, so irrigators who depend upon the Colorado are planning to produce to the limit.

THE WEATHER

Another liberal precipitation has been given the southern end of the state. The storm was general over the state but seemed to be much lighter in the north. San Bernardino reports the heaviest rainfall, with 2.83 inches; San Fernando, 2.59; Pasadena, 2.67; Redlands, 2.02; Santa Ana, 2.01. Other sections running from 1.50 to 1.75 are Los Angeles, Whittier, Riverside, Long Beach, Van Nuys, Hermosa, Manhattan, San Diego. Santa Barbara got a little over an inch and a quarter while Santa Maria received nearly two and a half inches. At Eureka something over an inch and a half was precipitated, but at San Francisco the rainfall was quite light. Stockton, Sacramento and nearby sections were given heaviest rain since early December. The table on market page shows exact amounts, but this covers only the period of seven days ending last Saturday night. In Arizona the storm reached the downpour stage. The Roosevelt dam has been filled and a terrific flood is endangering lowlands along the river.

PROHIBITING OLEOMARGARINE

There has never been any suggestion that the manufacturing of oleomargarine should be prohibited. It would be of no value if such suggestion were made, for if the manufacturer wishes to make oleomargarine or any other product which is not unhealthful or injurious when properly used there is no method of preventing him. The dairymen naturally do prefer, they even demand, that such manufactured stuff shall not be sold as a counterfeit of dairy butter. The whole contention has been over imitation. Sell oleomargine for what it is worth and for what it really is and producer and consumer should be content. However, a Pasadena subscriber writes:

"What have you to say about the narrow selfishness of farmers, as a class, who would, if they could, deprive the masses of consumers of a cheap, wholesome food, for their own benefit, by prohibiting the manufacture of oleomargarine altogether? I have met those who would and I believe that as a class generally they would do it."

It has been quite definitely shown that there is a food value in milk, butter and, in fact, all products of milk, which cannot by any possible twist of the chemist's ability be reproduced by mixing the purest of proteins and the purest of vegetable fats into any substance no matter how closely it may imitate pure butter, and so long as this difference in real quality does exist, there is abundant reason why the large manufacturers should be prevented from disposing of a manufactured substance for something which it is not.

MILKING MACHINES

Farm power is a slogan to conjure with these days. Labor is expensive; worse, it is often unreasonable and very exacting as to conditions under which it operates, so we are looking in every direction to secure all possible relief. The dairyman has been rather slow to use power in the milking operation, but the last few months have shown greatly increased use of power in this particular. We do not believe as many milking machines have been installed in a similar period as have been within the past six months. State Dairy Inspector Mason reports:

"During the past year 110 milking machines of different makes were installed on dairy ranches in the Eel River Valley of Humboldt County. Out of 360 dairies in this valley 110 are now using milking machines, or approximately 32 per cent. One-half of these machines are in use in the vicinity of Ferndale. Indications are that many more will be installed during the coming year." He adds: "The use of mechanical milking devices is no longer in the experimental stage. They are rapidly proving themselves a solution of the help problem for the dairy farm. Undoubtedly most of the complaints registered against these machines in the past have been due to improper care and handling of the outfit."

WOMEN DRIVERS

A member of the Los Angeles police force has made a discovery. He has investigated and finds that 20 per cent of the auto drivers are women while 30 per cent of the accidents to pedestrians are caused by women drivers. He grants they do not intend to, but merely lose their heads. In proof of this he cites an incident where a little child was knocked down by a slowly moving machine. It fell between the wheels as the machine was stopped, then the woman driver lost her head, reversed, backing the forward wheel over the child and causing its death. Which simply proves that the woman did what thousands of men have done, and lost her head at the wrong moment. The policeman recommends that all women be prevented by law from driving.

It appeals to us that the greater cause of this awful harvest of death —one pedestrian loses his life every ten days in the city of Los Angeles—is carelessness. In fact, practically all train wrecks, steamboat collisions and similar accidents may be laid to this same cause.

Often there are arrests, less often there are prosecutions, and almost invariably the one causing the accident goes free. Juries seldom find it in their hearts to convict a man or a woman unintentionally causing a death. Such conviction cannot save the life that has been snuffed out and of course the punishment already meted to the driver has been great. Even the drunks go comparatively free and the speed fiends are smiled at with mild indulgence—"nobody to blame."

It's time we looked at the menace of careless or inefficient or law breaking drivers. It isn't a matter of class or sex; it's a matter of instilling into the minds of all drivers the realization of the fact that common sense and thoughtfulness must be in control of the wheel of the automobile and that the driver who has little experience or has a make-up consisting largely of nerves shall refrain from driving in crowded streets or other complicated situations.

LEMON PICKERS

Modern day employers maintain that to secure best results from labor recognition of merit and efficiency and reward for real accomplishment shall be given, that is, reward in the form of preferred position or wages graduated according to time of service. Other things being equal, the laborer, whether on farm or in shop, who has served faithfully a term of years is of vastly greater value than the raw hand being given his elementary instruction in the work in hand.

Touching upon this principle a Los Angeles County subscriber writes:

"Why do lemon pickers have to work for less wages than almost anyone else? It is not every one who can make a good lemon picker. It takes experience and a trained eye. The producer and packer will probably say: 'Let supply and demand regulate the price. We can get men for 40 cents per hour so why pay more?' The workingman's answer would be to organize and demand more wages. Men who have been picking for this association for years and are adept receive no more than a beginner and our foreman told me they had men picking who were worth $5 per day to the association. I am no agitator but believe in justice and fair dealing to all.—By one who is picking."

If our subscriber has a correct understanding of the situation it appeals to us that a certain foreman or manager is due to lose his job. Orange growers, as a rule, are quick to see the advantage in following correct business methods and to discourage Bolshevism, and a foreman who permits tried and trained workers to draw no greater wage than that paid to the novice brought on the job from day to day will not secure most efficient service from his pickers. On the other hand, we grant that the short-sighted policy of such an employer may possibly be justified in his mind by the action of some labor unions. We believe that labor unions, as a rule, have taken the ground that six or eight hours service with time and a half and double time for overtime are the principal factors in labor employment without regard for efficiency. In fact, there have been well authenticated cases where it has been demanded of efficient help that it guage its production by the amount accomplished by the least efficient in the gang.

From the fair tone of this letter and the intelligence with which it is written we are sure this writer does not belong to that class, and it appears that he has just cause for complaint. No industrial employer has greater need for efficient help than the farmer and fruit grower. Hence every encouragement should be given to efficiency and integrity.

The Pecan at Home

By Ernest Braunton

THIS article is written largely to call attention to the fact that overflow lands along water courses, now unused, may be planted to profitable pecan orchards. We quote from a bulletin issued by the Texas agricultural college: "A great many of our native trees are on overflow land that is now considered worthless. It has been demonstrated that overflows seldom do any damage to pecan trees and, in fact, more often are a positive benefit. Land that is flooded during high water and is considered worthless for crops can be made valuable by working over the native trees, or, in case there are none, by planting out budded or grafted trees."

The writer knows of thousands of acres of such lands throughout California, from the San Joaquin and Sacramento Rivers on the north to the Los Angeles River on the south, lands now covered with willows or lesser growths of no value. Texas is the natural home of the pecan and contains more native trees than all other states combined. There are many trees growing along the rivers that will measure from four to six feet in diameter and are from 100 to 150 feet high. The trees are not, however, indigenous to all parts of the state, there being few in the eastern, extreme northern or western parts, but the trees thrive wherever planted. In the far western part, toward El Paso, where the climate is drier than any part of California, where fogs never occur and water is scarce and alkaline, certain varieties are recommended, and these are the ones best for California as the climate of the great central part of Texas, where native pecans grow best, is damp.

We quote from the Texas bulletin as follows:

"The holes for the young trees should be large and deep enough for it not to be necessary to remove more than the broken and bruised parts of the roots. Rich, mellow soil should be placed around the roots and plenty of water used. If it continues dry for a week after planting, the trees should receive another watering and a layer of dry soil be placed in the hole after the water has disappeared. The trees should be planted a little deeper than they stood in the nursery row. At least one-third of the top of the young trees should be removed, although this is not of as much importance as with peaches, plums, etc. Much better results will be gotten by planting during December, although the trees can be planted as late as the last days of February.

"A great many people report poor results from transplanting pecan trees. There are several reasons for this. The root system of the pecan differs radically from that of most of our other fruit trees. It is very large and long in comparison to the top and is soft and spongy, with very few lateral roots until after the third year. When cut or bruised it does not heal as readily as most trees nor does it form new roots with the same ease. Therefore, when the trees are transplanted every effort should be made to protect the roots as much as possible, and special pains be taken to prevent their drying out.

"Another trouble is, that many growers do not give their trees the proper care and attention after planting.

"The pecan grove should be cultivated and cared for, especially during the first ten or 12 years of its existence, just as well, if not better, than any other orchard. If the young trees are injured by the cultivator or by stock during the first few years, it will take a very long time for them to recover from the harm done.

"It probably takes longer for the pecan to reach full maturity than any other fruit tree. This means that there will be a number of years before the trees will begin to occupy all the space allowed them. It is, therefore, good economy to plant some crop between the rows, especially as it will ensure better working of the trees and, also, more than pay the rent on the ground until the trees begin to produce paying crops."

Varieties recommended for Texas are San Saba, Halbert, Texas Prolific, Hollis, Kincaid, San Marcos, Stuart, Frotscher, Van Deman, Russell.

Preventive Found for Apple Scald

Most people have learned that if they sleep in an unventilated room they poison themselves with the gases exhaled in their own breath. But it probably has not occurred to many people that apples asleep or semi-dormant—in cold storage—do exactly the same thing. It had not occurred to anybody, in fact, until very recently, when some specialists in the United States bureau of plant industry worked it out. It is not always possible to leave the windows open in the sleeping room of the apples, but the specialists have found a way of getting around this difficulty in experimental quantities by the absorption in certain fats and oils of the poison that is breathed out by the apples.

The disease which may be thus caused in apples is known as apple scald and manifests itself by turning the skin of the apple brown. While the scientists have discovered that the disease is due to a gas or gases breathed out by the apples, they have not been able to identify the gas or gases. But they have discovered that if the apples are placed in wrappers impregnated with certain fats and oils the poison is absorbed and the disease either prevented or reduced to a negligible quantity. In barrel experiments in which only part of the fruit was wrapped the scald was greatly reduced on apples adjacent to the wrapped ones. Ordinary commercial apple wrappers caused little decrease in scald and paraffin wrappers were but little better.

Several other points of importance were determined as a result of the experiments. Mature fruit scalds less than immature, but fruit just changing from green to yellow has scalded worse than either green or yellow fruit. Well colored red fruit surfaces have been practically immune. Heavy irrigation of apple trees increases the susceptibility to scald in the apples produced. Apples in ventilated barrels developed less than a third as much scald as those in commercial barrels if both were held in a storage room that received occasional ventilation. If the storage room was not ventilated, or if it was only poorly ventilated, the ventilated barrels caused very little decrease in scald. Apples near the aisle or near a door scalded far less than those in the bottom of the stack. Boxed apples exposed to a continuous air current of 88 miles an hour were practically free from scald while similar apples that did not receive the constant fanning became badly scalded. Stirring the storage air was found to be more important than renewing it. Scald was greatly increased on fruit delayed in storage unless well ventilated during the delay.

It has been feared by some truck farmers that the garden club movement might result in lessening the demand for truck crops, but since they have been in actual operation we have heard of no serious surplus. The United States school garden army, in which more than 2,500,000 children in the United States, Hawaii, Porto Rico, Alaska and the Philippine Islands, are now enrolled, has reduced the cost of living in hundreds of thousands of homes.

If head lettuce is shaded slightly in hot weather, it is not quite so likely to go to seed. Head lettuce does best in cool, moist weather.

Thin out dahlia shoots to two or three to the plant if large flowers are wanted.

Keep the lawn green and strong by putting on some sort of fertilizer occasionally.

DEHYDRATING GRAPES

The Sun-Maid Herald makes the following reference to methods of dehydrating grapes:

Dehydrating of cull and second crop grapes, as well as table grapes which have been slightly damaged, promises to become an important adjunct to the natural curing of raisins in the San Joaquin Valley.

Successful work on a commercial basis has been done this year in the plant of the Fresno Dehydrated Products Company, wbich was completed some time ago in Parlier. The primary purpose of the plant was to insure certain growers against loss from rain during the curing period, but present success of the plants apparently indicates that its scope can be widened to the extent where the dehydrating process may, to an extent at least, supplant the sun curing heretofore almost exclusively followed.

In the Parlier plant heat units have been so arranged in huge ovens equipped with fans that the fruit is "sweated" and the moisture developed carried away by the fans. Considerable experience and careful regulation of the heat is necessary, as too great a temperature results in cooking and consequent destruction of flavor, while a product which is not sufficiently dried will not keep for any length of time.

Records which have been thus far kept indicate that the total expense of dehydrating a ton of grapes is about $3. The time required is from 18 to 24 hours, depending upon the variety and physical characteristics of the grapes treated.

This season the experiment was conducted largely on partially dried second crop Muscats and cull Emperors and Tokays. The product is of such a grade that it commands a ready sale and is being marketed through the regular sale channels.

Paul F. Nichols of the United States department of agriculture has been at the plant since work was started and is collecting data which will be used as the basis for a detailed report. Mr. Nichols has made no statements as to his conclusions, but is known to regard the experiment very highly.

Dehydration as a means of preserving fruits and vegetables had been a principle in use for years, but it is only of a recent date that its practical, commercial application has become possible. The problem has been to so dry the fruit or vegetable that it will be restored to its original color and flavor with the mere addition of water. To accomplish this it has been necessary to work out a system whereby the food product to be treated would dry from the inside and such regulation of moisture and heat be maintained that the surface would remain moist by capillarity. In the Parlier plant it is believed this problem has been worked out. Experiments on fruits other than grapes probably will be tried out next season.

Cheap vegetable and flower seeds are often expensive at any price. It pays to buy good seeds from reliable firms of established reputation. Seeds are a small part of the cost of raising a crop. The best are none too good.

Send for seed catalogues and choose the seeds and plants to be used this year. It will be a good plan to order seeds and bulbs early for there is pretty sure to be a shortage of good stock again this year.

Save all the old shoestrings and narrow braids for tying up plants and vines. They are much better than twine.

We really have not the right to complain about "conditions" unless we are doing all we can to better them.

Do not be so cautious or so "busy" that you cannot help to make the neighborhood a better, pleasanter place to live.

When ingratitude comes to us it is usually a lesson that we may not shoulder other people's problems.

Hardie Sprayers Better Than Ever

HARDIE stands for spraying efficiency — fast and thorough work, HARDIE SPRAYERS have always been fundamentally right—built to give long and economical service.

But experience is a great teacher, as we come in close contact with orchard conditions from year to year, we find that we can make HARDIE SPRAYERS even better. It has enabled us to foresee the exacting requirements of the up-to-date orchards—the heavy demands put upon sprayers and to have a HARDIE ready to meet them.

So this year we give you a better engine with less fuel consumption—cutting down the cost of operation.

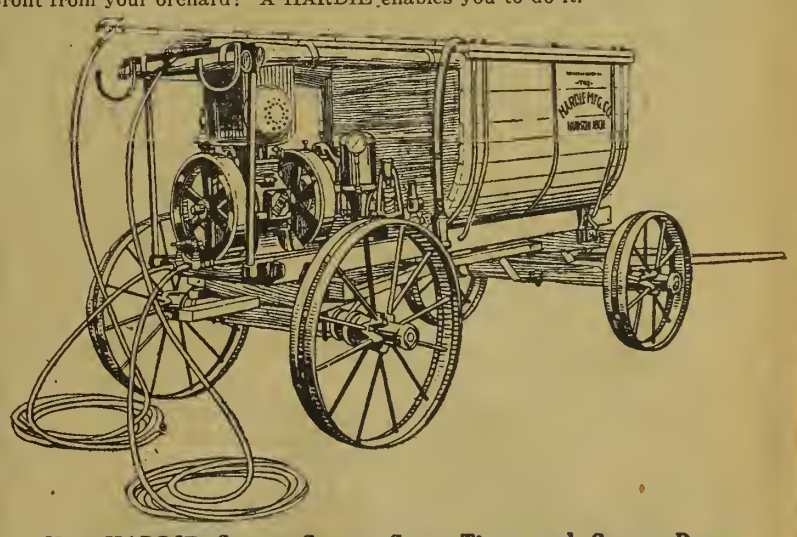
And this year the pump is stronger and more powerful roller block chain drive connection, bigger capacity and higher pressure—more rapid work.

With the new 1920 underfeed suction, longer life assured. This new device prevents gritty destructive dirt and sand from entering the pump valves, and you can clean it easily.

The rapid tank filler recently improved so that its capacity is greatly increased, rigid frame construction that holds engine and mechanism securely in place, and many other superiorities of HARDIE SPRAYERS.

It means that you can spray your orchard with a greater rapidity and far greater effectiveness with a HARDIE SPRAYER.

With fruit so high priced why not make certain that you get all possible profit from your orchard? A HARDIE enables you to do it.



Use HARDIE Spray Guns---Save Time and Spray Better

The Hardie Manufacturing Co.

TRACTION is what gives Monarch Tractors pre-eminence in every type of work. The traction is secured by means of the Monarch tracks which convert all the possible engine power into actual "grip on the ground."

The Monarch tracks are constructed of tough, wear resisting Manganese Steel. Covered by a broad and full guarantee as to wearing qualities.

There is a Monarch for every farm and the Monarch will do every type of power farm work quicker, better and more reliably. Strength, ruggedness and mechanical ingenuity are built into every part of every Monarch. Made in the following sizes: 30-18 H. P., 20-12 H. P. and 16-9 H. P.

Read what Monarch users have to say. Our "Performance Booklet" sent you on request.

Central California Celery Season

By E. W. Stillwell, Assistant Truck Crop Specialist for the Pacific Coast.

REVIEW of 1919-20 season to February 1. It is now possible to obtain a fair estimate of the success or failure of the 1919-20 celery deal in Central California. In the Antioch and Walnut Grove districts, which comprise 90 per cent of the acreage in this part of the state, 70 per cent of the acreage has been harvested and about 80 per cent of the crop shipped. The other districts are practically cleaned up.

Early in the season growing conditions in these two districts were especially favorable and it was confidently predicted that yields would be heavier than the preceding season and would average not less than 120 crates per acre. It was also thought the season would be earlier than usual and that the shipments for Thanksgiving and Christmas trade would be correspondingly heavy. To state the situation briefly, it was estimated that there would be shipped from Central California about 2,000 carloads of celery, an increase of about 83 per cent over the 1918-19 season, as compared with a 65 per cent increase in acreage. It was also believed the crop would be shipped early, although perhaps not as early as in 1918-19. The latter part of November a heavy storm accompanied by high winds and low temperature damaged the crop slightly and reduced shipments. Prior to this the first car had moved from Walnut Grove October 24 and Antioch started shipping about November 1. The movement for the Thanksgiving trade was heavy. Yields up to that time ran from 180-200 crates to the acre and sizes 80 per cent No. 1's (7's and larger).

No temperature records are available for Walnut Grove but the weather bureau reported a minimum of 31 degrees at Antioch on November 24 and 30 degrees at Sacramento on November 28. The crop had just recovered from this setback and shipments were increasing when the coldest snap of the year, or at least the one which lasted longest, came. On December 13 Sacramento reported a minimum of 27 degrees and Antioch 32. The cold spell at Sacramento started December 12 with a minimum of 32 and minimums of 28, 32, 33 and 33, December 14, 15, 16 and 17 respectively were recorded. Conditions at Antioch were similar. Frosts were reported on ten days in December at Sacramento.

Coupled with these low temperatures was extremely dry weather. Up to February 1 this has been the dryest season in the delta since 1850-51 with the exception of the 1917-18 season. This condition made the damage more severe than it otherwise would have been. Tops were frosted severely and in some places the outer stalks also were frozen. The immediate effect was to cut down shipments and to check growth. It caused discoloration of the tops and consequent decrease in market value. The net loss is estimated at this time to be 100 cars at Walnut Grove and 150 cars at Antioch.

Dry weather continued and January shipments were light, running to very small sizes, one car containing about 2,300 dozen being shipped.

The estimates of future shipments are based on the supposition that the rainfall and temperature from now on will be normal. Stock now in the fields is small in size and not over 18 inches long. The hearts are poorly developed, short and small. Shipments have temporarily stopped, shippers hoping rain and warm weather will cause further growth.

Based on estimated shipments, the average yield per acre of marketable stock will be 106 crates at Walnut Grove and 90 crates at Antioch.

The following brief comments are made on other sections:

Sacramento. Crop cleaned up. Considerable quantities moved out in l. c. l. lots and were consumed locally. Average yield probably around 125 crates per acre.

Stockton. Crop cleaned up. All shipments made prior to cold weather, therefore the yield was high, probably about 190 crates. Sizes ran large, 90 per cent No. 1's.

Vernalis. Planting was late and the land did not seem especially suited for celery. Not over 20 acres of the original plantings will be harvested. These 20 acres will produce only a fair quality crop. Sizes are small and bunches are short. The yield will be light and it is doubtful if more than five carloads will be shipped, probably late in February.

Watsonville. Original planting about 110 acres. At least 25 acres were destroyed by flood waters due to poor draining. Other fields were seriously damaged by water. The best fields averaged around 120 crates per acre. Sizes generally ran 50 per cent No. 1's.

Antioch was the heaviest shipper, sending out 892 carloads as against 654 the preceding season. Walnut Grove came next with 721 carloads as against 422 the year before. Other shipping points sent out this season: Sacramento, 40 cars; Watsonville, 31; Holt, 30; Knightsen, 19; Burlingame, 11; Stockton, ten; Vernalis, five; San Francisco, three; Watsonville Junction, 2; Kingdon, Colma, Palo Alto and San Mateo, one each. Total shipments, 1,758 cars from acreage planted of 3,400.

Careful Handling Prevents Spinach Losses

Losses in spinach shipments can be greatly reduced by careful handling in harvesting and packing and by effective refrigeration in transit, according to specialists in the bureau of markets. Reports show that some of the principal spinach shipping sections of the country are suffering considerable loss from decay and deterioration in transit caused by the development of slimy soft rot. This decay develops rapidly in transit when temperature conditions are favorable, say the bureau men. It starts at places where the leaves have been bruised or wounded and it very frequently follows attacks of blight or other field diseases. Other causes of deterioration in transit are yellowing and wilting of the leaves. Prompt handling and shipment at a low temperature largely reduce losses from these causes.

Crushed Ice Prevents Rot

That shipments of spinach arrive in better condition when crushed ice is used in each package than without the ice is shown by test shipments made from Austin, Texas, by the bureau of markets during the last two years. Where ice was used in these shipments practically no soft rot had developed when the spinach was removed from the car, while comparable shipments without ice had developed 8.9 per cent. Three days later the iced spinach had developed only 11.9 per cent of soft rot, while that shipped without ice had developed 26.8 per cent. These shipments were made in freight or express refrigerator cars, the bunkers of which were iced in the regular way.

How Crushed Ice Is Used

When barrels are used the investigators found that several layers of crushed ice scattered through the barrel are needed, a large layer being placed on top of the spinach next to the barrel head. Holes bored in the bottom of the barrel provide drainage. Shipments in baskets or crates carry best with a layer of crushed ice in the center of the container and another layer on top of the spinach just under the cover.

Test shipments made to determine the effect of washing spinach before shipment showed that washing has an unfavorable effect on its keeping qualities. On removal from the car at destination, unwashed spinach showed practically no soft rot, while washed spinach showed 5.5 per cent. Three days later the washed spinach developed 24.8 per cent, while the unwashed had developed only 5.7 per cent.

Nematodes

THE most serious question confronting California producers today is: 'To what extent will the nematode evil menace our crops.'" This is practically a correct statement of a remark made by W. V. Shear as he came into the Cultivator office a few days ago. We remarked that this microscopic pest was rather a small specimen to cause so serious a statement and so serious a look as appeared on Mr. Shear's face. He was quick to reply: "I am perfectly serious and the whole state will soon be very serious in discussing this problem. Thousands of acres are now infested and the pest is spreading with fearful rapidity."

To give graphic proof of the seriousness of the situatioon, Mr. Shear opened a package of perhaps a dozen dwarfed, diseased carrots. They were

A Menace to California Agriculture

Nematodes as they affect carrots. All producing sections of California are in danger of being affected by this pest. But few crops are immune to its attacks.

one mass of gnarled and knotted roots with practically no large root stalk or edible portion. Of course we countered with the remark that the world could get along with a material reduction in its supply of carrots, but were quickly informed that the infestation of carrots was one of the smallest of our problems, for the nematode respects few other crops. Barley, corn, walnuts and a few other of our trees may not be so susceptible to injury from this microscopic pest, but the number of less susceptible plants whose culture on infested areas would starve out the pest through rotation is extremely limited.

There is no known treatment for the soil, or rather no treatment within economic bounds, which will eradicate the pest, and where one has secured high priced land and the water right to make its productions of high value and finds himself restricted to the growing of corn, barley and possibly sorghums because he finds his soil infested with this pest, he is not particularly happy.

The work of the nematode upon roots is shown by a specimen discovered by Mr. Shear, photograph of which appears on this page. Mr. Shear is taking the specimens to headquarters of the state department of agriculture at Sacramento. Of course he is taking no news, for this pest has been discussed for many years, but he is taking proof of its magnitude and the increased menace. Probably the greatest distribution of this pest comes through seed potatoes, and county and state commissioners are taking greatest pains to prevent scattering of these diseased or infested potatoes.

As noted, the pest is not confined to our root crops but attacks almost all of our trees. The state agricultural experiment station some years ago held a discussion of nematodes on roots of citrus trees. This citrus nematode is a branch of the family which infests potatoes and carrots, and fortunately its spread can be controlled more readily. Description and life history of the pest are given in Essig's "Injurious and Beneficial Insects" as follows:

Life History

"The young eelworms feed upon the roots of various plants, causing galls or knots which may greatly impair growth. The female develops within the affected areas and begins egglaying, the eggs hatching in a very short time. The winter is passed in the original host, such as nursery stock, if it remains growing in the soil, but if the host is removed they feed upon various plants left in the fields. The young have the ability to encyst themselves so as to resist great extremes of weather and unfavorable conditions, so when once established in the soil it is very difficult to eradicate them.

Nature of Work

"These minute worms, working into the roots of plants, produce very characteristic galls or warts and cause what is commonly known as root knot.

Distribution

"As a producer of root knot this pest is very common throughout the state, but somewhat more abundant in the central and southern parts. As a potato pest it has been reported only from Alameda, Contra Costa, Inyo, Los Angeles, Monterey, Sacramento, San Joaquin, Santa Barbara and Tulare Counties."

This pest is widespread in its infestations. Bulletin No. 45 of the Hawaiian agricultural experiment station, which is just from the press, gives a list of potato diseases of the Hawaiian Islands. Amongst the worst of these troubles given is nematodes, gall worms, or eelworms. The bulletin refers to its devastation of potato fields and then gives list of susceptible crops as follows: Alfalfa, asparagus, beans, beets, cantaloupes, carrots, celery, clovers, cowpeas, cucumber, egg plant, field peas, figs, grapes, kale, lettuce, okra, onions, peaches, peppers, pumpkins, salsify, spinach, soy beans, strawberries, tobacco, tomatoes, watermelons. The immune, or rather the less susceptible, crops, are: Barley, corn, peanuts, pearl millet, rye, sorghum, timothy, wheat. Rye and sorghum are of particular value for growing on infested ground for the reason that they permit of clean culture, that is, the keeping down of weeds, nearly all of which, if allowed to grow, harbor the pest and prevent starving it out.—C. B. M.

A NATIVE BARBERRY

Parts of California are of such broken topography that certain species of plants are isolated, semingly unable to get out of a pocket surrounded with hills, for example, into the hollows or valleys about them. Such a plant is Berberis Nevinii, or Nevin's barberry. It was found many years ago by Rev. Joseph Nevin, formerly a missionary in China and a botanist of note. For years it was not named by Dr. Asa Gray, for but one station could be found for it, but it was finally conceded to be an extremely rare but distinct species. It is a well formed shrub six to nine feet high, of gray-green compound leaves, very attractive. About Christmas the yellow blossoms appear in large clusters, very thickly over the whole plant. It thrives anywhere in the garden.—E. B.

On St. Valentine's birthday, February 14, the Federal Motor Truck Company celebrated its tenth anniversary—only a decade—yet placing this company in this comparatively new industry among the pioneers in the exclusive manufacture of motor trucks.

Own a "Selected" Farm in Western Canada

Make Bigger Profits!

THE most wonderful opportunity in the world for Business Farmers is in the "SELECTED" FARMS which can be bought for $15 to $40 an acre along the lines of the Canadian National Railways in Western Canada.

"Selected" Farms

These "SELECTED" Farms are carefully chosen from the cream of the richest wheat and cattle country in America, to meet your special needs, on the advice of experts representing 14,000 miles of railway, whose assistance, though free to home seekers, is of great practical value.

A Cordial Welcome

Western Canada extends a helpful hand to home seekers. Friendly neighbors, with the same customs and language—splendid schools, churches and social life—every benefit that you formerly enjoyed and many advantages that you could not get from higher priced land elsewhere—warm, sunny, growing summers and dry, cold, healthy winters—await you in this wonderfully prosperous "LAST WEST."

Taxes Are Low

Western Canada taxes fall lightly on the farmer. A small tax on land, but buildings, improvements, animals, machinery and personal property are all tax exempt.

Big Profits in Wheat and Dairying

Western Canada is famous for its big wheat yields. "SELECTED" FARMS along the lines of the Canadian National Railways average more than 20 bushels of wheat to the acre. Under specially favorable conditions a yield of 50 to 60 bushels per acre is not uncommon.

Dairying is exceptionally profitable. That soil and climate are well adapted to it is shown in greatly increased production and high quality maintained. A world-wide market awaits all that Western Canada can produce.

Fortunes from Beef and Dairy Cattle

Western Canada, the Cattle Man's Paradise! Beef and dairy cattle yield great profits. Stock thrive on the prairie grasses, which in many cases cure standing and make fine hay. Cattle and horses require only natural shelter most of the weather, and bring high prices without grain feeding.

Easy Terms

Terms on "SELECTED" Farms: About 10 per cent cash down, balance in equal payments over a term of years; interest *usually* 6 per cent.

Special Rates to Home Seekers

Special railway rates will be made for home seekers and their effects to encourage personal inspection of the Farms along the lines of the Canadian National Railways. Rates and full information will be sent free on request. *Write or mail coupon TODAY!*

Perforated Tree Protector

that will keep Squirrels, Rabbits and Gophers from barking your trees and give perfect protection from hot sun, sandstorms, barking in cultivation, etc. Tell us your pest and we will tell you what kind of a wrap to use. We make a number of kinds and can save every tree for you from pests.

Collapsible Planting Pots

These pots are bottomless. This allows you to plant pot and plant, never disturbing your plant nor stopping its growth in transplanting a single hour. For starting early vegetables, such as Tomatoes, Cabbage, Eggplant, Cauliflower, Cucumbers, Cantaloupes and Squash; also for propagating Rose Cuttings, Geraniums, Eucalyptus, Olive Cuttings. It's the only practical pot on the market today for propagating work. Write us for samples of either Pots or Protectors. Tell us which you are interested in.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Budded—No. 1 Softshell

Among my walnuts I have about five acres of Neffs Prolific trees, six years old and most of them in good shape. They bore well last season and it was not till then I learned that the association classed this variety as No. 1 instead of "Budded", although they were a fine large heavy nut. Is it probable that in the long run it will pay me to work them over to Placentia or Eureka?

The differential in price between Budded walnuts and No. 1 Softshell is so small that we do not think it would pay to make the proposed change. The Neffs Prolific walnut is more resistant to blight than the Placentia and usually produces more weight of walnuts to the tree than the Placentia, so that the money yield is fully as great as from the Placentia though the walnuts are always classed as Softshells.—J. B. N.

Starting Guava Trees

How are guava trees started and at what season? — Subscriber, Santa Paula.

Guavas are usually started from seeds but may be grown from cuttings if one has bottom heat, either hot-bed or hot-house. Only the strawberry guava has been grown from cuttings outdoors by the writer; the others are difficult to root except under glass. The red strawberry guava will root at this season of the year in light soil or sand in a warm garden spot. All species and varieties grow readily from seeds, but all are variable and no doubt named grafted sorts should be placed on the market.—E. B.

Income Tax

If a single man has income of over $1,000, but expenses so he does not have $1,000 clear, does he need to make report? Also in case this man is a discharged soldier, does this give any advantage, or rather does he have any additional exemption? — Subscriber, Escalon.

Yes, if the single person's gross income reaches $1,000 he must make his report. If it should be exactly $1,000, while his report must be filed, there is, of course, no tax to be paid. If the income is $1,001 he is taxed on the $1 to the amount of four cents. The fact that one has an honorable discharge from the army does not affect the income tax. Under California state law such soldier has exemption from state and county taxation to the extent of $1,000 assessed valuation.

Fungus Infesting Fly

I am sending pests which are infesting my potted plants. It is a small fly, flying thickly about. What are they and what will drive them away? —Subscriber, Crockett.

These were referred to Commissioner H. J. Ryan of Los Angeles County, who says:

"This group of insects is known to science as mycelophilidae. They infest decaying vegetation and fungi, including the common mushroom. They are but transient and nothing is usually done looking to their control or extermination. Their presence may be due to decaying matter in soil, and change of soil may help. Also a few drops of carbon bisulphide in soil would doubtless kill them but may also injure the plants. It is advised that nothing be done at present and doubtless flies will soon be gone."

Currants

Will you please tell me if the dried currants we buy put up in packages are real currants or a kind of grape? Where can one get a start of them?—Subscriber, Santa Paula.

These "currants" are a small grape tested by the University of California and by many grape growers in the Fresno section. They do well in California and without question will be a factor in our food production. The rooted vines may be had of nurserymen who are advertising in the Cultivator.

Head Gate

How large a head gate must I make for a ditch to hold 60 miner's inches of water? How deep and how wide must the ditch be dug to hold it? Is the water to be measured under pressure? —Subscriber, Millville.

We presume the gate is intended for use as a measuring weir. If this is correct, a cheap gate which is approximately correct can be made by placing a board across the ditch in such a manner that it will hold standing water above it to a depth of three or more inches. Then with two shorter boards fastened on the upper edge of this leave an opening 12¼ inches wide. Drive a stake into the ground three feet above the board in the bottom of the ditch so that the top of the stake will be at the top of the water when the water stands ready to run through the opening. Have the ditch below clear so that when the full head of water is running through the opening there will be a fall of at least six inches below the opening. When the running water stands at a depth of six inches on the stake there will be 60 inches passing through the gate. Smaller amounts may be measured by closing the gate until the water stands at a depth of six inches on the stake and multiplying the width of opening in inches by five; thus, when the opening is eight inches there will be approximately 40 inches going through the gate. If the water approaches the gate slowly and clears away from the gate rapidly, with enough depth of water above the gate, the measurement will be correct to within five per cent. With a fall of six inches to 100 feet, as above stated, there is danger of the ditch banks washing badly and cement pipe, or cement lined ditch will be much more satisfactory. Cement pipe ten inches inside diameter will be large enough to carry 60 inches of water under this fall but should have a box or a length of larger pipe at the head to give pressure. A cement lined ditch with the bottom ten inches wide and sides ten inches high laid with a slope of one-half to one, that is having the top of the sides 15 inches apart, will be ample in size.—J. B. N.

A PERFECT PRODUCT

Perfection is not secured on earth. However, to all intents and purposes there are some things that grow so nearly perfect that they become a thing of beauty and an inspiration to higher endeavor. A head of cabbage may not appeal as having very wide range in the matter of inspiration, but in these times of long prices, and often of indifferent products, stuff produced in our own gardens should be encouraged as a means of greater comfort. So peace gardens are becoming almost as popular these days as were the war gardens of two years ago. Some of these gardens are in the back yard of the town lotter; others in the secluded corner of a citrus orchard or a prune orchard or a vineyard of the San Joaquin Valley. Wherever they may be these garden plots should be extended. This notwithstanding the fact that perhaps a large percentage of failures attend these endeavors because they are a side line and do not get the care and attention which is expended on a regular business such as growing citrus, cherries, sheep or other products.

One of the backlotters is John N. Gardiner whose "farm" is in Eagle Rock Valley, Los Angeles County. He brought to this office a head of cauliflower, some seven or eight inches across top, as solid as it is possible for a head of cauliflower to be. It is one of the most perfect heads we ever saw, and the first question was: How did you do it? Mr. Gardiner started to tell us, and then we asked him to take his time and write it down.

It will not be cauliflower planting time for some weeks or even months to come, but when the proper time does arrive, or before, Mr. Gardiner will give information as to cauliflower growing in the small garden.

AVOCADO GROWERS MEET IN MAY

The Avocado Growers will meet in Los Angeles May 7 and 8 in annual session. A business meeting will be held in the afternoon of Friday, May 7 followed by the annual dinner in the evening. Saturday will be given to papers and discussion. Secretary Hardin writes that the association is in excellent condition financially and membership is rapidly increasing.

NURSERYMEN'S BUD SELECTION ASSOCIATION

The board of directors of the Nurserymen's Bud Selection Association of California met last week in San Francisco and got down to definite action by electing a manager, appropriating funds for investigational work, selecting a place for permanent headquarters, appointing committees, etc.

The manager selected is L. B. Scott, for many years with the United States department of agriculture, and stationed in California making investigations in bud selection and the breeding up of better types of fruit trees. His work was largely at the experiment station at Riverside. California horticulturists will be glad to learn of Mr. Scott's connection with California horticultural work in a way which will result in such large return to the state. Mr. Bergtholdt writes that he is highly gratified that so efficient an executive and a man so well qualified to superintend the work has been secured.

The liberal appropriation made for investigation work will enable Mr. Scott to begin almost immediately the work which the nurserymen are taking up. They will be aided in this by agents of the federal department of agriculture. San Jose has been selected as permanent working headquarters of the association. We are not informed yet as to how soon Mr. Scott will take charge of this work.

Committees were appointed to work with similar committees named at the fruit growers' convention and various fruit packing and canning concerns to the end that undesirable fruit varieties may be eliminated and those varieties which are adapted to California conditions and the demands of California canners and dryers shall be developed. This will give the nurserymen a great advantage for the committee's recommendations will not only be of value to the nurserymen in making selection and growing their stocks but to the orchardist in giving to him fairly definite assurance that he is planting what the trade is demanding. This action taken by the nurserymen is an important forward step in the march of California horticulture.

THE NEMATODE PEST

Harry S. Smith of the state insectary in a recent news letter gives the following facts as to the nematode pest:

The common root nematode or eelworm (Heterodera radicicola) presents at the present time probably the most serious pest control problem confronting the service. While it is not a new pest, having been found in the state at least as early as 1910, its spread has been such as to bring it rapidly to the forefront until, at least in Northern California, it is attracting more attention from pest control officials, both state and county, than any other problem. A large percentage of the potatoes now found in the markets show the evidence of this disease. The shortage of good seed potatoes, together with the high price, furnishes a strong temptation to plant inferior seed. These infested potatoes planted in clean districts inoculate the soil with the pest and thereafter the potatoes produced on this soil are sure to show the disease. This means a great loss both to the grower and the consumer, and once in the soil it is very difficult if not impossible to get the nematodes out. The same is true with nursery stock, the planting of trees with infested roots bringing about a condition in the orchard which is sure to mean a permanent loss to the grower.

Since there is no practical method of ridding the soil of these worms and since there are still many districts in the state which are apparently free from the pest, it is of utmost importance that neither nursery stock nor potatoes showing the effects of this disease be allowed to be planted in clean districts. While the nursery stock problem can be handled by the county horticultural officials through inspection and rejection, it is much more difficult in the case of potatoes, and a campaign of education regarding this disease is necessary for that reason, since even potato peelings thrown in the back yard are capable of inoculating the soil.

H. P. Stabler, horticultural commissioner of Sutter County, makes the suggestion which we thoroughly approve that we "start a vigorous campaign at once through the county horticultural commissioners, University of California, farm bureaus, horticultural and agricultural papers, newspapers generally, agricultural marketing associations, and last but not least the housewives of the state through their various clubs and organizations." This campaign should have as its object the acquainting of farmers and others with the danger of contaminating their soil by planting infested potatoes or throwing out infested potato peelings, and also to familiarize them with the problem as it affects nursery stock, in this way securing for the commissioner the complete backing of the grower in cases where he finds it necessary to reject material.

AID TO GRAPE MEN

Director Hecke of the state department of agriculture announces that an appropriation bill of the United States department of agriculture, now pending before congress, provides for the purchase of the experimental vineyards at Fresno and Napa. The committee has reported favorably upon the purchase of these two tracts and it is hoped that the justice of the appropriation will be finally recognized by all members and the desired relief thus secured. By this legislation the federal government opens the way to other utilization of over 180,000 acres now devoted to the production of wine grapes.

The situation was carefully investigated by the federal department and a report has been rendered that the purchase, equipment, and operation of the vineyards in question is essential to effective continuance of the work which should be done in assisting the many grape growers to readjust themselves to the changed conditions brought about by the existing economic conditions.

THE PRUNE AND APRICOT GROWERS

The 10,000 grower members of the California Prune and Apricot Growers, Inc., the state wide cooperative organization which claims to market 75 per cent of the dried prune and apricot acreage of the state, are receiving notice this week that the association will exercise its options on their crops for the years 1920 and 1921.

This means that the association, acting as the selling agency of the prune and apricot growers of California, will, at least for the next two years, market more than three-quarters of the dried prunes and apricots produced in the state.

In notifying its grower members that it will sell their crops during 1920 and 1921 the California Prune and Apricot Growers, Inc., gave out today what are practically final figures on its recent membership campaign during which it informed the growers that unless they gave the association proper support it would go out of existence.

The organization department of the association announced that up to February 10 new acreage signed as a result of the campaign amounted to 32,913 acres of prunes and 12,892 acres of apricots. This is 64 per cent more prune acreage and 110 per cent more apricot acreage than was demanded as a minimum.

NATIONAL FLOWERS

Much has been said and written about our national flower, but none has ever been formally adopted. It may interest our readers to know what the national flowers of other countries are. Here is the list: Wales, leek; Spain, pomegranate; Scotland, thistle; Saxony, mignonette; Prussia, linden; Italy, lily; Ireland, shamrock; Germany, cornflower; France, fleur de lis; England, rose; Egypt, lotus.

"Making any progress towards getting acquainted with your new neighbors?" "Just a little. Their cat invited our cat over to a musicale last night."

Don't think your only debts are those measurable in dollars and cents. Your community also has a claim on you in the way of interest and a bit of time now and then.

Insect Pests and Plant Diseases

By Ernest Braunton

THE bureau of entomology, United States department of agriculture, has established a new branch at Alhambra, Los Angeles County, for the study of the bean weevil. The station is in charge of A. O. Larson and Perez Simmons, who have as a working area the states of Washington, Oregon, California, Arizona and New Mexico. They are now following up the life history of the weevil in California, observing local bean fields and growing some for more intimate observation. After this fundamental work is ended these two men will range over their broad field, studying the work of the weevil in all the chief bean growing centers.

Roy E. Campbell, scientific assistant, truck crop investigations, has studied "the broad bean weevil" and written a bulletin under that title, No. 807, but is now engaged in investigation of the green pea aphis and will continue on this line during the remainder of the pea season. He has covered all of Southern California, the Haywards section in Central California and the mammoth sweet pea fields of the Santa Clara Valley and elsewhere. At the end of the season he will prepare a report fully covering the activities of this pest, with full information regarding liquid and dust sprays, the formulas, seasons for spraying, number of times necessary, cost, and other points of value. When the days of peas are over, war will be launched on the bean aphids, on common, lima, horse beans and vetches.

D. G. Milbrath, assistant in vegetable pathology, is at present studying diseases of broccoli, cabbage and lettuce, both in laboratory and field, and every day may be found in the "cabbage patch" with phials of disease cultures inoculating the ill fated plants chosen for experiment. He is concerned largely in the commercial shipping end of the truck garden industry, studying diseases that develop in transit to market.

W. M. Davidson is on the trail of the walnut aphis, looking for and studying its natural enemies, though his field is in no wise confined to this one line of investigation, for he is working on broad lines, covering all insect pests, and his field is not limited. He is expected to tackle any such problems as may promise material aid to local growers. Just how many lines of work and how many laboratories Uncle Sam has in full swing at Alhambra we cannot state definitely, for still others are at work occasionally and range afield from their private living quarters, but the one next noted is the largest of three laboratories visited by the writer.

Fumigation

R. S. Woglum needs no introduction to readers of the Cultivator or to citrus growers of California and Arizona, for he has been at the head of fumigation investigatioon and demonstration for many years. His headquarters at 824 North Curtis St., Alhambra, are surrounded with orange trees, and tents are over some of them at all seasons. Just at present Mr. Woglum is experimenting with the application of liquid gas, especially daylight and sunlight fumigation, the dosage, influence of temperature, limitations of plant injury, etc., for the introduction of liquid gas has revolutionized fumigation practice. In pot or machine generation of gas the latter went at once to top of tree, at high temperature, so that sunlight caused burning. With liquid gas, already at low temperature and vaporized under the tent, thereby keeping temperature at the lowest, the gas is thin and cold at top of tree and sunlight cannot burn the foliage. He is also studying the relation of Bordeaux paste or spray mixture to fumigation. At present if fumigation is given orange or lemon trees after trunks have been painted with Bordeaux paste, even after the lapse of several months, all the leaves may be killed. Mr. Woglum has also solved the problem of exterminating those close partners and co-workers, the Argentine ant and the more serious citrus mealybug, Pseudococcus citrophilus. Several orchards near Upland, once badly infested, have been completely cleaned.

State Activities

The state department of agriculture has an insectary at Alhambra at work on biological control of the citrus mealybug. This work is in charge of H. M. Armitage, who has three species under observation but is more closely watching the parasitic work of Cryptolaemus Montrouzieri on these pests. He has lately established a branch at Upland and is also working about Venice and coastal points. Last year the main plant turned out 150,000 of these parasites, and this year the capacity of the plant has been doubled. While at this laboratory the writer met C. P. Clausen, formerly engaged in this work but lately appointed by the United States bureau of entomology to go to Japan to study the natural enemies of the June bugs or May beetles. He may be absent for three or four years.

The state has still another insectary at Alhambra where Harold Compere, son of the veteran bug hunter in foreign lands, George Compere, is working on parasites of the black scale only. The two insects he is rearing in large numbers are Scutellista cyanea and Apsycus Lounsberryi. This work is wholly experimental. The scutellista does not hatch in large numbers at the time most needed in some sections of the South, and it is expected to develop and ship colonies to such sections at seasons of greatest scale activity. It is also hoped to propagate the aphycus in large numbers so that the two parasites may, through quantitative production, control the black scale as has another parasite, the citrus mealybug, by shipping them to points most needed. If these demonstrations prove successful the propagation of these parasites on a large scale will doubtless be undertaken.

Real Cause of High Prices

Preamble and Resolutions Adopted by Napa Grange No. 307, P. of H., February 6, 1920.

The farmers of the country have arrived at that point where they will no longer be satisfied to work long hours and receive barely enough for their products to "keep even," while manufacturing concerns dominated by labor unions work short hours and receive cost of production and a good profit based on a short hour day. When there were special reasons urged by the government for increased production, the farmers demonstrated their willingness to do their full share toward securing that increased production by laboring long and dilligently and selling their goods at prices fixed by the government. At the samo timo they were doing this, other industries, factories and shipbuilding plants were selling their goods for prices based on an eight hour day with time and a half and double time for overtime and upon which no governmental limit had been placed. This schedule is now in full force and effect and the federation of labor has issued an ultimatum that the standard must not be lowered. We submit that there is no justice in this discrimination and insist that the time has come when agriculture should be classed as one of the big industries and recognized as such. We ask for no class legislation or special privilege, but we insist that the farmer should be paid for his products on the same basis that other industries are paid for theirs. If it is fair and just for other industries to receive cost of production plus a reasonable profit based on an oight hour day, then it is equally fair for tho farmer to receive pay for his product calculatod in the same way; and if not so paid, the result will be a gradual and steady exodus from the farms to the cities thereby lessening the production of food stuffs with a conse-

quent increase in price for the same. We realize full well that under the present extravagant and wasteful system of distribution the price of farm products calculated on this basis would necessarily be considerably higher than at the present time; but in the name of common justice we submit that there is no good reason why farmers should not be paid for their products on the same basis that other industries are paid for theirs; and we believe that the efforts of the so-called "consumers' leagues" represented by city women who know very little of the actual time, labor and expense involved in the production of food stuffs, could, with very much better grace, be directed toward the real cause for high prices, the elimination of so many middlemen rather than against the producers' associations which are only trying to secure fair prices for the farmers. Therefore,

Resolved, that we the members of Napa Grange, No. 307, P. of H., hereby pledge ourselves to strive by all honorable means to bring about the results sought in the above Preamble.

Resolved, that copies of this Preamble and Resolutions be sent to each Grange in the state and to the State Grange for endorsement and assistance and to our Grange representative in Washington, D. C.

POISON THE PESTS

With the present campaign on rodents of all kinds there is need of methods which will secure greatest results for least expenditure, especially where large fields are to be operated in. A farmer of the Middle West, coming to California, brought his shrewdness and his observing eye with him and has learned one method of gopher control which is somewhat different. He discovered it through his planting of sorghum grains. He planted a field of white Gyp, and at a time when conditions were right, but few of his seed ever showed a sprout. He made investigations and found sections in the road where 10 to 20 feet were sometimes entirely bare.

His observing eye soon developed the fact that this method of planting made it particularly easy for gophers to follow the rows and clean up his seed. Hence, appeal to the same method to catch Mr. Gopher. His method of planting the seed had been to arrange behind the one chisel-tooth shovel of his cultivator a piece of ordinary rubber garden hose, the lower end of which was nearly even with the lower end of the chisel-tooth. At the top a small funnel enabled him, as he walked along following the "planter," to drop some eight or ten seeds to the foot, and as the dirt fell behind the cultivator shovel his planting operation was completed. Once the gopher found this streak of soft earth it was an easy matter to follow the row and dispose of the seed.

The next batch of seed was prepared according to the usual strychnine-sugar or syrup formula. The poison was poured over the grain while it was still warm, but the seed was not cooked or destroyed. The same method of distributing was followed as in planting, and a material lessening in the work of gophers was noted. The next trial was in an alfalfa field. A short time after rains, when soil was in good condition, the same chisel-toothed cultivator, the same polsoned seed, the same funnel with hose were brought into action. When the work of gophers showed up thickly, the field was traversed with regularity, but more often, here and there, as the need appeared. The result was a great lessening of gopher damage to that alfalfa field. Five gallons of poisoned grain will cover about ten acres.

This is the plan as reported by C. A. McDermott who first practiced it in Tulare County and succeeded with it for many years.

CLUB WORK PROFITABLE

Agricultural club boys in Eldorado County borrowed $592 in March, 1918, from local banks to start their pig club projects. In August, 1919, an inventory showed that these boys owned or had sold $5,826.25 worth of swine. Eight gilts, exhibited by the Eldorado boys at the state fair, brought an average price of $56.50. They were from the first litter out of the original sows.

Owing to the high prices of pork last year, 63 per cent of the 1919 enrollment in the California agricultural clubs went into either the sow and litter or the pig feeding contests. Many club members in the state paid high prices with borrowed money for pure bred animals, and in most cases have more than repaid the loans out of the first litters.

Occasionally the pure bred pig clubs in California have found difficulty in securing adequate prices for the stock they raise. To eliminate this trouble they have resorted to the means used by other pure bred breeders and have organized auction sales. Two were held in the past year, one at Lemoore, Kings County, and one in Fresno County. At Lemoore 38 animals brought a total of $2,751, or an average of about $72 a head, which is about the market price for pure bred animals in California. In Fresno County 29 head of pure bred Poland Chinas brought a total of $981.50, or an average price of $68.30.

HIGH YIELDING CORN

E. C. Frazee, a Sonoma County subscriber, writes regarding the value of seed selection in building up a strain of higher producing corn. Corn is a more expensive crop as grown in California than in the East. On the other hand, it is a higher producing crop in this state than it is in the East. Hence, its culture should be encouraged and the campaign undertaken by a number of careful growers, by the Sperry people, and others has increased the popularity of this crop. Regarding methods and the value of selection, Mr. Frazee writes:

"It's really quite a simple matter. In the first place I had the good fortune to find a suitable sport from which I grew and successfully (perhaps it was partly luck) selected the parent stock which in ten years' time has produced results almost unbelievable to those who have not seen it.

"I started early in the work of corn propagation. When I was yet a boy I took a great fancy to corn. I always thought that corn should produce several ears per stalk instead of one. I hunted the corn fields far and near for a likely mother stalk. Many a day and many a field I hunted and many a year I continued this.

"For 50 years corn had been but slightly improved. To be sure, this, that and the other seedsman had introduced new varieties by the score but their newness consisted mainly of a varying of color, texture of corn, earliness or lateness of ripening, etc. They all seemed to be mainly striving for a cylindrical ear. Probably the corn shows where cylindrical ears were so favored had quite a bearing on holding back development looking to heavy production in preference to type of ear, for almost invariably the 'handsome' ears were awarded the prizes.

"During my many years of search for a suitable sport showing multiple ear qualities I discovered many more or less suitable, but none of them developed up to the standard which I had set, until, while searching a large field of particularly fine corn in a mid-west corn belt state I discovered a fine vigorous, upstanding stalk with five good ears on it. It proved to be a strong transmitter of its high yielding qualities and became the original foundation mother stalk of a strain which now produces stalks giving an average of more than five ears."

PARALYSIS OF BEES

At a meeting of beekeepers at Orange, Professor Coleman was asked what produced paralysis of adult bees and what would cure it. He answered that no bacteria had been discovered that would cause such trouble. The bees come out of the hive, have convulsions, and die. Dr. Sturtevant has studied the problem deeply without being able to discover a cause. The so-called disappearing disease appears to be the same thing. It seems that bees confined in hive and that have eaten all stores go out in fine weather, eat heavily of nectar, and this causes auto-intoxication. It seems to affect only the older bees. Weather conditions are probably more to blame than anything else we can at present ascribe.—E. B.

Don't get cold feet when things look dark. Any man who has reached the top can tell you that the road to success is lined with toll gates.

Clark "CUTAWAY"

Harrows and Plows

CLARK "CUTAWAY" Double Action Harrows thoroughly dig, mix and pulverize every inch of soil. A perfect seedbed is prepared by their forged sharp cutout disks made of toughest cutlery steel that does not chip, crack or break. Once over does the trick, same as going over your ground twice with any ordinary implement. They

Thoroughly Pulverize every Inch of Ground

The rear gangs are forced to cut exactly midway between the track of the front gang disks. The Improved CLARK Main Frame of special steel holds all gangs in their appointed place as in a vise. Sliding and trailing is impossible. Each disk does its duty—cuts its own way.

CLARK "CUTAWAY" Tillage Machines contain the most advanced, most practical features of construction. They stand foremost in quality and service. They have many valuable, exclusive features. They work out the price the first season, in better cultivation and greater crop yields.

Don't be influenced against "cutout" disks by manufacturers who are unable to produce an enduring "Cutout" disk of CLARK "CUTAWAY" quality.

Have your dealer show you CLARK "CUTAWAY" Harrows and other tillage machines illustrated on this page.

Born June 18th, 1919. **75 Per Cent. White.**

Straight and Strong. **An Individual you can be proud of.**

DAM—A 20-lb. cow, 90 per cent white. Her daughter made 26.96 lbs. butter from 527.4 lbs. of milk. By a 25-lb. son of JULIANA KING OF RIVERSIDE, whose 16 A. R. O. daughters include 3 above 28 lbs. butter in 7 days, 3 yearly records above 1,000 lbs., and who has 3 granddaughters above 34 lbs., and 4 with year records from 1,113 to 1,331 lbs. butter. Dam is out of a 21-lb. four year old sister of ARALIA DE KOL, age 12 years, 30.14 lbs. butter, 365 days, 1,142 lbs. butter, and is half sister to two 30-lb. cows.

SIRE—Has 2 A. R. O. daughters and more coming on. Combines in the closest possible degree both through sire and dam, the blood of the noted sires, FOBES TRITOMIA MUTUAL DE KOL, (38 A. R. O. daughters, 3 from 30 to 36.44 lbs.) and HOMESTEAD JUNIOR DE KOL, (72 A. R. O. daughters, 7 from 30 to 35.55 lbs., 12 granddaughters 30 to 39.37 lbs.). This cross produced all the high record daughters of the former sire. Both his sire and dam have 3 30-lb., 75 per cent sisters, one being a former WORLD RECORD HOLDER in 30 day class.

Berkshire Breeders Hold Fine Meeting

The annual meeting of the Western Berkshire Congress held at the university farm, Davis, February 18-19, was considered one of the most satisfactory ever held by that organization.

The morning of the first day was devoted to a student's judging contest, a large number of university and farm school students participating. At the close of the contest Professor J. I. Thompson announced the following winners: 1, J. R. Waters, West Lafayette, Indiana; 2, G. V. Steed, Los Angeles; 3, A. H. Sinnock, Berkeley; 4, S. Harrington, Berkeley; 5, R. L. Suppes, Los Angeles; 6, E. J. Phillips, Pasadena; 7, Miss Ruth Grim, Anaheim; 8, Lyle Ferguson, Yuma, Arizona; 9, L. T. Baldwin, San Francisco; 10, S. A. Anderson, San Gabriel.

Miss Ruth Grim of Anaheim was awarded the prize for the best woman judge of Berkshires.

At the annual meeting, held the afternoon of the first day, James Mills of Hamilton City, one of the largest breeders of the West, was elected president; H. C. Muddux, prominent banker-breeder of Sacramento, vice president; J. Francis O'Connor, Castleview Ranch, Santa Rosa, secretary. The following breeders were named as the board of directors: W. S. Guilford, Butte City; A. B. Humphrey, Escalon; W. F. Sandercock, Sacramento; Mrs. Ruth Hardy, Orland; W. M. Carruthers, Live Oak; Frank B. Anderson, Sacramento; George Murphy, Perkins; D. C. Bunn, Prosser, Washington; A. P. Warnock, Pleasant Grove, Utah; J. P. Bonner, Silverton, Oregon; W. Teesdale, Fallon, Nevada.

The retiring president, A. B. Humphrey, in his opening address outlined the activities of the congress during the year of his administration and reviewed in detail the more salient accomplishments. Humphrey expressed the opinion that the outlook for the breed was never brighter but urged that the breeders adopt a vigorous promotion policy.

In his annual report the retiring secretary, Frank B. Anderson of Sacrameto, disclosed the fact that during the year 1919, 114 Berkshires were sold through the promotion sales sponsored by the association and that the sales resulted in 46 new men entering the business.

During the meeting plans were discussed for furthering the Berkshire cause and it is probable that the congress will engage the services of a field man whose duty it will be to devote his entire time toward securing wider distribution for Berkshires. The members of the association feel that with a field man to look after the staging of sales, developing the market through pig clubs and county units and securing publicity for the activities of the breed, many men will be attracted to the business of producing Berkshires.

The congress adopted a new constitution and by-laws including a unique plan for membership dues. It is proposed that each member be assessed two dollars and in addition one dollar be collected for each sow maintained in the herd. The dues will be payable March 1 and September 1. Junior memberships are also provided for boys and girls, dues being one dollar.

It was proposed that arrangements be made for holding a futurity show at the coming state fair.

Following the sale a banquet was held in Sacramento. A. B. Humphrey presided and an opportunity was given all to express their views.

A Magnificent Dairy Barn at Oakley

A fine example of saw-tooth roof barns built by the Central Creamery Company. As may be noted, sliding doors are located at the end of double cow alleys. Note litter carrier track extension at right hand of barn where litter is dumped into manure spreaders. Note openings in silos with galvanized iron chute hanging from one. In the top of the left hand silo there is located a 10,000 gallon water tank which furnishes supply for watering cattle and washing stable. This is fully equipped with one of the most up-to-date milking machines and in every way a thoroughly up-to-date barn.

Berkshires in Strong Demand

The annual Berkshire classic, the Western Berkshire Sale, held at the university farm, Davis, February 18, proved to be one of the most successful sales ever held by that organization and served to lend the greatest encouragement to the supporters of that breed. Twenty-nine head, 16 sows, eight gilts and five boars sold for a general average of $174.65. The 16 sows sold for an average slightly higher than $200 and the boars averaged $195.

The top of the sale was fetched by the good young sow, Hopland Grand Lady 2d. from the consignment of H. C. Muddux & Son, Sacramento, and purchased by J. Francis O'Connor, Castleview Ranch, Santa Rosa, for $750, the highest price paid for a Berkshire sow in California in recent years. The sire of this sow was a son of Rival's Champion and the dam was a daughter of Grand Leader 2d.

The top boar was Wilsonia King Laurel, a two year old son of Laurel Champion and out of Miss Vilia 2d, and a litter mate to the well known Eastern boar, Real Type. It is of interest to note that the only time the two brothers met in the show ring Wilsonia King Laurel stood higher than his illustrious litter mate. The boar was consigned by the Sandercock Land So., Sacramento, and was purchased for $600 by A. B. Humphrey of Escalon.

A feature of the sale was the rating of the sale animals by Professor J. I. Thompson of the animal husbandry division. Three classes were arranged, one for boars, one for sows and one for gilts. The Duke's Improver, an April, 1919 boar consigned by E. J. Ferguson of Santa Rosa, won the boar class; Hopland Grand Lady 2d consigned by H. C. Muddux & Son, Sacramento, won the sow class and Escalon Fashion Lady, consigned by A. B. Humphrey, Escalon, was awarded first place among the gilts.

A splendid crowd of buyers was on hand to purchase breeding stock and it was the opinion of a number in attendance that the Berkshire swine industry of the state faces a period of prosperity and that the demand for good Berkshires is rapidly increasing. Prof. J. I. Thompson selected a number for the College of Hawaii, the remainder of the offering being scattered to various sections of the state. Col. Ord L. Leachman was the auctioneer. Following is detailed report of the sale:

BOARS

5. Packer Bend Farm, Willows, $145.
13. A. B. Humphrey, Escalon, $600.
21. R. W. White, Woodland (pig), $50.
31. Geo. P. Upham, Martinez, (pig), $50.
35. Montezuma Ranch, Collinsville, $120.
32. Anchorage Farm, Orland, $130.

SOWS

2. J. Doto, Woodland, $165.
3. A. R. Kruger, Sacramento, $150.
4. Anchorage Farm, $250.
7. Mrs. E. M. Holje, Calistoga, $160.
8. J. Francis O'Connor, Santa Rosa, $750.
9. J. Francis O'Connor, $330.
10. Geo. Glade, Davis, $130.
11. Geo. A. Stingle, El Monte, $135.
12. J. Francis O'Connor, $225.
14. H. C. Muddux and Son, Sacramento, $300.
15. Packer Bend Farm, Willows, $210.
19. A. B. Humphrey, $110.
20. H. F. Alps, Reno, Nevada, $110.
22. Geo. M. York, Modesto, $145.
23. Packer Bend Farm, $140.
26. C. E. Barrows, Orland, $105.
28. College of Hawaii, $100.

THOMPSON TO LEAVE UNIVERSITY

Although it has been known for some time among his intimate friends, it has just been announced to the public that Professor J. I. Thompson, associate professor of animal husbandry in the University of California, has tendered his resignation to the board of regents to take effect July 1, at which time he will take over the management of the newly established breeding farm owned by C. Harold Hopkins and located just west of the university farm at Davis.

Thompson came to the university following his graduation at the Iowa state agricultural college in 1910, and during the ten years that he has been identified with the livestock interests of this state he has come to be regarded as one of the soundest authorities and judges in college circles and his work has been a large factor in the development of better livestock in California.

Much of the popularity that the animal husbandry division enjoys is due to the personal popularity and esteem the livestock men of California and the West accord "Tommy."

Thompson has been secretary of the California Swine Breeders Association since its organization. He has also served as secretary of the California Draft Horse Breeders Association and has officiated as judge at many of the state, western and national livestock shows. During the year 1917-1918 he was exchange professor at the Kansas state agricultural college.

His resignation will be a distinct loss to the university but the fact that he will remain in this state is a source of great satisfaction to his hundreds of friends. In his new work he will have charge of the development of what promises to be one of the most important breeding farms to be established in the West. The owner has already laid a discriminating foundation for a select herd of Shorthorns and it is expected that future plans will include swine and sheep.

CALIFORNIA CATTLEMEN'S ASSOCIATION NEWS

Reports on the drouth situation continue to arrive at the offices of the California Cattlemen's Association. The consensus of opinion is that the cattlemen in almost all sections of California will suffer in some degree. Many sections, however, profess ability to pull through on feed that is available.

Following receipt of advices from the Cattle Raisers Association of Texas to the effect that range was immediately available for 40,000 head, the California Association is making further investigation of Texas conditions. The Texas association said that the range offered could be had at 50 cents to $1 per head per month. Texas was also stated to be in the market for cattle to restock its ranges which were depleted by the drouths of the previous three years.

* * *

Two enthusiastic meetings of county associations were held February 14, one at Suisun and the other at Sonora. In Suisun the Solano Cattlemen's Association held its annual meeting and banquet. The principal speaker was Fred H. Bixby, president of the state association. Mr. Bixby's talks are always straight to the point and his address was warmly received. He told the cattlemen that only by united effort could they get the legislation and other protective measures that their industry needed.

The feature of the Tuolumne County gathering at Sonora was the return to the association of former state senator John Curtin, who announced that he was in full accord with the present plans of the association and pledged himself to work for their fulfillment. He was elected vice president of the county association. W. J. Rushing was re-elected president.

* * *

Senator John Kendrick, president of the American National Livestock Association, has been invited to address the semi-annual convention of the California Cattlemen's Association to be held in Los Angeles in April.

PETERS LEAVES HOLLYWOOD

In a recent leter from F. S. Stimson, Hollywood, Washington, owner of Hollywood herd of Holsteins, he says: "C. W. Peters, formerly superintendent of the Hollywood farm, has left us to go into farming and dairying on his own account at Issaquah, Washington. While we were very sorry to lose his valuable services we realized that, with his great ability to produce, he surely would be successful, and we could only wish him every success in his new venture. Mr. Peters came to Hollywood in August, 1912, as herdsman, and by untiring persistence, ability and honesty, gradually became superintendent of all Hollywood. He is responsible for placing the herd where it has been at all times. Here is another case of how a man rises from the ranks to a high position by paying strict attention to his business."

STATE RECORDS BY DAUGHTERS OF KING KORNDYKE PONTIAC 20TH

The two first daughters to freshen of King Korndyke Pontiac 20th, the great young Holstein sire owned by W. J. Higdon, Tulare, have both established new California records at their ages. Both were bred exceedingly young, and neither has attained the growth usually desired in first calf heifers. One of them, Anoakia Pontiac Beets 2nd, freshening at one year eights months and two days, on official test made 16.51 pounds butter from 400 pounds milk in seven days, both of which are California records at age. It will be noted that this milk production is an average of over 57 pounds per day. The other, Anoakia King Korndyke, after a very difficult calving, at the age of one year, five months, 24 days, made on official test 15.25 pounds butter from 355 pounds milk, the latter being the California record at age. Note that she averaged over 50 pounds milk per day. Both of these heifers are of excellent type, carrying splendid udders of fine texture and good balance, and indicate the fulfillment of the great promise held out by daughters of this bull. Both of these heifers were bred and are now owned by Anita M. Baldwin, Santa Anita Rancho, Santa Anita.

A New Mexico farmer claims to have produced a hybrid of millet and Johnson grass which is proving remarkably fine forage under New Mexico conditions. It is claimed for it that it will produce three crops during the summer and remain green in the winter.

The Modesto Sale

Modesto, March 18, 1920

50 Registered Holsteins 50

This offering contains offerings from eight well known Stanislaus County herds, including a considerable number of A. R. O. cows and daughters of such cows, many of them in calf to some of the best bred bulls in the state. The sale includes:

A 26.19 POUND DAUGHTER of Pontiac Jewel Butter Boy, bred to the three times grand champion King Segis Alcartra Prilly.

A 25.45 POUND GRANDDAUGHTER of Colantha Johanna Lad out of a sister to the 37 pound cow Boweda, bred to King Alcartra Prilly.

A 22 POUND GRANDDAUGHTER of Ignaro De Kol, bred to an 823 pound son of King Segis Alcartra Abbekerk.

A 21 POUND 3 YEAR OLD half sister to the state record 2 year old Belle Faskie De Kol Witkop, bred to Segis Pontiac De Kol Dutch, whose three nearest dams are all 1,000 pound cows.

A 21 POUND 4 YEAR OLD daughter of a 26 pound cow, well along with calf to King Segis Alcartra Abbekerk, proven 30 pound son of the $50,000 bull.

A 16 POUND COW bred to Segis Pontiac De Kol Dutch, whose three nearest dams are all 1,000 pound cows.

How to Kill the Pests and Stop Your Losses

SEND THE COUPON on opposite page. Read these *new* facts on spraying now. You can't expect your apples, peaches, pears, plums, grapes and other fruit to live and produce profitable crops if infested with San Jose Scale, Codling Moth, Scab, Blotch, Bitter Rot and other deadly, life-sapping diseases and pests. You can't expect your potatoes to develop and grow—your Hogs to put on money-making weight —or your Hens to lay—if eaten up and tormented by bugs, mites and lice. Authorities say that the deadly ravages wrought by these ruinous, destructive pests cost farmers untold millions each year.

Spraying Will Stop Your Losses

Learn how spraying will enable you to drive these pests from your farm. How spraying will save your part of this tremendous loss and add hundreds—even thousands—of dollars to your profits each year. Send the coupon for all the facts now.

* * * *

There is a type of Hayes Sprayer for Orchards, Gardens, Field Crops, Vineyards, Nurseries, Trees, Potatoes, Cotton, Flowers, Alfalfa, Sugar Beets, Disinfecting Hogs and Poultry, Whitewashing and Cold Water Painting. Whether you need the great Triplex Fruit-Fog Power Sprayer or the smallest Garden Atomizer, you'll find it in the Hayes Line.

Send the Coupon

FRUIT-FOG SPRAYERS

Send Coupon for Secret of "Fruit-Fog" Spraying

LEARN why Fruit-Fog is the greatest boon to Fruit Growers ever discovered. How mighty yields that are almost unbelievable are being produced in Fruit-Fogged Orchards. This is because Fruit-Fog---the vaporous super-spray---is the only spray *fine enough* to seek out and kill the *hidden* pests.

These *hidden* pests are the millions of insects that infest the microscopical niches and crevices in bark, buds and foliage, where no heavy, coarse low-pressure spray can reach. These hidden pests cost fruit growers untold millions each year. They sweep away fine fruit worth fortunes in a single season. Yet Fruit-Fog will entirely *exterminate* them. Fruit-Fog will add 100 per cent to 5,000 per cent to your yield and your profits this year. Send the coupon and learn *all* the facts.

"Fruit-Fog" Sprayers With Famous Engine

Fruit-Fog is produced by Hayes guaranteed 300-lb. high pressure and the Hayes Scientific Nozzle. Because of its vapory fineness, Fruit-Fog has wonderful adhering power. No drops form—no solution wasted—no buds or leaves knocked off—as with heavy, coarse, low-pressure sprays.

Hayes Fruit-Fog Sprayers are skillfully designed and finished. Every part is positively standardized. They give enduring service and greatest efficiency under high pressure. To insure the best possible engine service, we have selected the famous Fairbanks-Morse "Z" Engine after countless comparative tests.

Valuable Spraying Guide Sent FREE

Send the coupon for Big Book FREE, which pictures and describes the Fifty Styles of Hayes Sprayers. Also for our valuable FREE Spraying Guide. See why the deadly pests that infest your farm cost you more each season than several Hayes Spraying Outfits. Learn how to stop these losses. How to recognize and kill every pest! What solution to use—how to mix it—how and when to apply it. The Book and Guide are worth hundreds of dollars to any Farmer or Fruit Grower. In sending coupon please tell us how many trees you have and how old on the average. Also other uses for your sprayer. Send coupon today.

Hayes Fruit-Fog Gun

World's fastest spraying apparatus. The only gun which combines great speed with the thoroughness of Fruit-Fog One man handles capacity of big Power Sprayer. Simple twist shoots long spray to top of tallest trees, or wide spray for close-up work, or shuts off tight—preventing waste of solution between trees. Guaranteed. Write for details.

Horse Association of America Fully Organized

The Horse Association of America, a non-profit corporation organized under the laws of Illinois, is now an accomplished fact. The organization is backed by horse breeders representing all breeds of horses, by the saddlery and harness interests, by the horseshoe manufacturers and master horseshoers, by the hay, grain and feed interests, and by the carriage and wagon builders of America. The purposes of the association as set forth in its charter are to aid and encourage the breeding, rearing and use of horses. The primary aim of the organization will be to bring prominently before the public and all transportation users the great part which the horse plays in agriculture, commerce and transportation, to emphasize the important part the horse occupies in pleasure, and to work ceaselessly for the improvement and upbuilding to higher standards of our existing types of horses. Of the 21,000,000 horses now on farms and ranches in the United States, it is safe to say that less than 5,000,000 are of distinct types well calculated to do their particular job in life. The Horse Association of America, through every conceivable avenue of effort, will work for the improvement of our horses to the end that the majority of them may be highly efficient in the particular line for which they are intended.

It must be understood that the Horse Association of America is not fighting mechanical motive power as such, for in its proper place it is of value, but the use of mechanical motive power units in lines of work where horses will do the work more cheaply and more efficiently is a distinct loss to everyone concerned and increases materially the cost of business operation and thereby the cost of living for every family in America.

The officers of the new association are men whose business experience and standing in their respective lines of industry will give the public confidence in the organization. Their names, with brief sketch of business connections, follows:

W. S. Dunham, president, is proprietor of Oaklawn Farm, Wayne, Illinois; John W. Gaver, vice president, is president of the Scheffer & Rossum Company, St. Paul, Minnesota, one of the largest saddlery houses in the Northwest; Glen Perrine, second vice president, is chairman of the publicity committee of the Carriage Builders National Association, Cincinnati, Ohio; Wayne Dinsmore, secretary, is secretary of the Percheron Society of America, which position he has occupied for the last ten years; George S. Bridge, treasurer, is a member of the firm of Bridge & Leonard, members of the Chicago Board of Trade.

The other directors are: L. J. Elliott, Racine, Wisconsin, president of the Imperial Bit & Snap Company; F. H. Sweet, Kansas City, Missouri, is a member of Sweet-Piper Commission Company; John E. Madden is proprietor of Hamburg Place Farm, Lexington, Kentucky; M. C. Peters is of the M. C. Peters Mill Company, Omaha; E. W. O'Grady is secretary of the Master Horse Shoers Association of Chicago; Lynn H. McCurdy is president of the Hercules Buggy Company, Evansville, Indiana; Walter Schuttler is secretary and treasurer of the Peter Schuttler Wagon Company, Chicago.

Membership in the new association will be $5 per share, and individuals, firms, or corporations may subscribe for as many shares as they desire. The initial payment of $5 per share also pays the first year's dues; subsequent dues are $5 per year per share. The funds drawn from the different industries and sources will be used to carry out the purposes of the association which have already been outlined above.

Parties desiring to become members of the Horse Association of America and to become identified in the support of its work should make application to Wayne Dinsmore, Secretary of the Horse Association of America, Union Stocks Yards, Chicago, Illinois.

Dairy People, Not Women, at Fault

While the manufacturers of so-called milk and butter substitutes, a dozen or so in number, are spending millions of dollars to exploit their products and steal the good name of butter, the manufacturers of milk and butter, thousands in number, sit idly by—with the exception of a very few—and let the tirades against dairy products run their race and die a natural death, is the opinion of Sam H. Green of the California Dairy Council. At least, they let those die which will die, but the most dangerous propaganda has been permitted to continue uncontroverted until it has reached the point where the rank and file of consumers, club women and politicians secure their information from that source and their opinions are molded accordingly.

No industry ever possessed ammunition for protecting and advancing itself such as Doctor McCollum has given to the dairy industry, and the time has come when the dairy industry needs ammunition, and needs to use it for the protection of its own welfare.

The time has certainly arrived when it would appear to be the part of wisdom for those whose business depends upon the cow to open their purse strings just a little and get solidly behind an organization of their own with their moral and financial support.

Those interested in the manufacture and sale of so-called milk and butter substitutes have, in their wisdom, spent large sums of money educating the consuming public to think as they desire it should think. It is quite evident that as a result of their business-like efforts they have reached the point where the public is beginning to fight their battles for them, which battles are against the dairy industry.

Will those interested in dairying, from the man who milks the cow to the man who markets her products, continue in a state of lethargy while the foundation of their industry and the foundation of health, vitality, vigor and life of the nation's people is being undermined by all who care to libel milk, butter and other dairy products, or will we realize that this foundation is too necessary, too sacred to be demoralized?

This is no time to complain of or blame those who attack dairy products in the belief that they are too expensive. This is the time for proving that dairy products are not too expensive as compared with other foods; that they are absolutely essential in the human diet to the extent of 18 or 20 per cent. This is the time to quit blaming others and begin blaming ourselves for the adversities which are taking place in the dairy industry and which promise to be more serious unless definite and unified efforts are promptly made.

The National Dairy Council, 910 Michigan Avenue, Chicago, is vested with the machinery for telling the story that will impress itself indelibly upon every American mother. All that is needed is the cooperation and support of every man interested directly and indirectly in dairying. The amount of money that would be necessary from every dairyman, if all would cooperate, would be a sum so small that the amount paid by the laboring man to his union would look like a young fortune. If you would do your part in the biggest work that can be done for your industry and for the welfare of this country, just drop a card to the National Dairy Council and let them tell you what your part is.

THE POLAND CHINA SALE AT MERCED

The first consignment sale of the Merced County Poland China Breeder's Association was held in Merced, February 21. The top of the sale was the sow Long Wonder consigned by Paul E. Mitchell, being purchased by J. F. McSwain, Merced, for $275.

What was particularly pleasing to the members of the association was

W. L. Haag & Son **John M. Bernstein**

Announce Their

Second Banner Poland China Sale

Hanford, Cal., Saturday, March 13, 1920

W. L. HAAG & SON

LIBERATOR

Two boar pigs by this WORLD'S FAMOUS SIRE, out of Helen Buster a granddaughter of Giant Buster. Real herd headers of the most pronounced type and breeding. ALSO
One boar pig by Lendorris Liberty Bond, that will show for himself.

JOHN M. BERNSTEIN

3 **Bernstein's Big Lassie**
Big Square Lassie
California Square Lassie 3

By Big Square Jumbo 2nd, dam Big Bone Lassie and bred to THE YANKEE, JR., LENDORRIS LIBERTY BOND and Vaughn Jones, three California boars that are producing type and quality.

One by King's Big Bone Leader.
One by Giant Jones.
One by Miller's Long Chief.

bred to THE YANKEE, JR., the sire of sires.

The above gives you some idea of the class and breeding of the animals we are putting into this sale. We will strive to make each succeeding sale a better one. Every sow in this sale has proven her worth as a producer, as a mother and is bred to a boar whose breeding and individuality assure litters of the correct type.

You will find a wealth of big type breeding in this sale, the kind that stands for breed improvement. We believe you will appreciate this offering and they sell at your valuation.

Sale at 12.30 *Lunch at 11.30*

Sale will be held on Kings County Fair Grounds, Hanford, Cal.

Geo. W. Bell, Tulare, Auctioneer **Write Today For Catalog**

the fact that the majority of the animals sold remained in Merced County. Pure bred swine are not so thoroughly established in Merced County as in some of the other counties of the state. and special effort had been made to interest the local farmers. The average of a little more than $100 was deemed by the breeders as highly satisfactory and as a result of this sale the swine industry of the county has been materially improved. Ord L. Leachman, Sacramento was the auctioneer. Following is report of animals selling for $75 or more:

2, P. Carmean, Merced, $75.
3, A. W. Morley, Merced, $75.
10, J. F. McSwain, Merced, $275.
11, J. F. Wolfshin, Merced, $100.
12, T. R. McSwain, Merced, $185.
13, S. H. Allen, Merced, $105.
16, P. B. Poor, Merced, $145.
17, Mrs. O. Silman, Merced, $100.
18, M. & A. L. Bassett, Hanford, $110.
20, J. W. East, Snelling, $80.
21, Mrs. O. Silman, $110.
22, Les McCracken, Ripon, $100.
25, J. Wilson, Merced, $170.
26, P. Carmean, Merced, $105.
28, Wm. Bernstein, Hanford, $125.
30, E. L. Morley, Merced, $75.
31, J. Wilson, Merced, $210.
36, P. Carmean, $135.

BERKSHIRE SALE AT CLEARWATER

Success was written all over the records of the first auction sale of 23 bred Berkshire sows and gilts held at Clearwater on February 21, by the Southwestern Berkshire Congress. Although the bad weather (or good rainy weather) and lack of time to prepare a sale somewhat handicapped the organization in its efforts, yet the good crowd assembled and the fair prices obtained indicated that the demand for Berkshires is stronger than it has ever been in Southern California. There were no sky-rocketing prices, neither were there any entries withdrawn from the ring. The top price of $250 was paid by the Italian Vineyard Co. of Guasti for Emblem Lady Duchess 5th, a bred sow consigned by E. J. Barker of Thorntown, Indiana. The 23 head sold at an average of $114.65. Five baby pigs donated to the congress brought $119.50. Animals were consigned by Italian Vineyard Co., Guasti; F. L. Hall, Perris; D. J. Bastanchury, La Habra; John Donaldson, Perris; Inglewood Union High School Pig Club; Geo. A. Stingle, El Monte; California Truck Co., Los Angeles; A. B. Humphrey, Escalon; E. J. Barker, Thorntown, Indiana; Whittier State School; J. Francis O'Connor, Santa Rosa, and Carruther's Farms, Live Oak. Col. Ben Rhoades cried the sale in his usual spirited manner. The animals were distributed among the following buyers:

Model Leader 3rd, Italian Vineyard Co., Guasti, $160.
Rose Crest Mistress 6th, D. J. Bastanchury, La Habra, $110.
Rose Doon 2d, B. Hiregoyer, Heber, $75.
Rose Doon 3d, Cal. Truck Co., Los Angeles, $125.
Anchorage Duchess 8th, Italian Vineyard Co., Guasti, $115.
Dukes Julia of Hollow Hill, Italian Vineyard Co., $200.
Improver's Master Bella, 2d. J. C. Biedebach, Pasadena, $77.50.
Wilentha Lady 20th, J. L. Wilson, Lamanda Park, $75.
Emblem Lady Duchess 5th, Italian Vineyard Co., $250.
Polly's Queen 2d, Geo. A. Stingle, El Monte, $100.
Star Oaks, F. L. Hall, Perris, $165.
Longfellow's Queen 18th, Italian Vineyard Co., $100.
Artful Julia, D. J. Batanchury, $100.
Improver Rival Belle 6th, Frank M. Hinton, Santa Fe Springs, $90.
Escalon Polly 4th, F. L. Hall, Perris, $150.
Rose Crest Laurel 5th, B. Hiregoyer, $115.
Julia Hill, B. Hiregoyer, $122.50.
Whittier Longfellow Belle, J. C. Biedebach, $87.50.
Whittier Longfellow Belle 2, J. C. Biedebach, $62.50.
Whittier Rival Dollie, E. D. Steburg, Lamanda Park, $70.
Whittier Rival Jewel, J. C. Biedebach, $77.50.
Meadow View Lady 4th, D. J. Bastanchury, $100.
Castleview Grand Lady, Geo. A. Stingle, $110.

Owing to the interest evidenced at the first sale the Southwestern Berkshire Congress has decided to hold a series of sales, the next one to be held in the near future.

DIP DRIVING OUT SHEEP SCABIES

In the work of eradicating sheep scabies from the United States employes of the United States department of agriculture made more than 22 million inspections and supervised more than ten million dippings during the last fiscal year. The work was conducted in cooperation with state officials. No cases of sheep scabies are now known to exist in Montana or North Dakota, in addition to numerous other states where the disease had previously been eradicated. In Idaho a spread of the infection during the previous year has been brought under control. Sheep scabies is a disease that has been prevalent chiefly in the western part of the United States.

GRAZING SEASON ON NATIONAL FORESTS TO BE SHORTENED

Early spring grazing on Western ranges has so materially reduced the carrying capacity and forage resources that the forest service, United States department of agriculture, has found it necessary on many of the national forests to shorten the present grazing season from two to four weeks. This cut will be put into effect this spring.

"It is the purpose of the forest service," states an official in charge of grazing, "to place the livestock industry on the national forests on a substantial, permanent basis. To do this it is necessary to produce a maximum cover of vegetation on all ranges. The first precaution is to avoid too early grazing. Every stockman interested in his business knows that forage plants can not be grazed the instant they begin to show above the ground. Such early spring use of the range not only decreases the density and luxuriance of plant growth, but also reduces the carrying capacity and the fertility of the soil, and if continued, ultimately results in waste range.

"Studies carried on at the Great Basin experiment station in Utah have proved that where plants are continually cut back or cropped, the root system loses its vitality and the plant soon dies. On some of the national forest ranges, which are grazed early and heavily, the forage plants are showing similar signs of serious damage, and will rapidly go from bad to worse if remedial measures are not put in force. The old grasses, with their root systems weakened by repeated cropping, are almost exterminated and are being replaced by worthless weeds. Erosion of the soil has also started in many places and threatens serious damage. Experiments have shown that from a ten acre tract, heavily overgrazed, as much as 25 tons of earth and rock have frequently been washed down after a few minutes of heavy rain. These are some of the things which follow in the wake of too early use of the range and from overgrazing.

"A grazing season that starts later in the spring, thus giving the forage plants a chance to develop, and more careful management of the range, will do much toward bettering and eventually eliminating such conditions."

DOES THE ADVANCED REGISTER PAY?

In order to obtain the best prices for surplus stock Advanced Register records are almost indispensable. This has been well illustrated in practically every Guernsey sale held since the Advanced Register was established. A study was made of 21 sales held in ten states during the year 1919 and it was shown that the average price of 141 A. R. females was $1,255; of 183 females without A. R. records but having A. R. dams, $607; of 485 females without A. R. records and without A. R. dams, $438. Average price of four bulls with A. R. progeny was $2,240; 85 bulls with A. R. dams, $740; 57 bulls without A. R. dams, $193.

It will be noted that in 1919 Advanced Register cows sold for nearly three times the price paid for females without Advanced Register records or Advanced Register dams, and that daughters of Advanced Register dams sold for $169 more than the daughters of untested dams. The high average of $438 for females without records and whose dams have no records can be largely attributed to Advanced Register records elsewhere in the pedigree of these animals.

According to these statistics, an Advanced Register record placed on a foundation cow in the average breeder's herd would increase the value of her progeny by at least $175, and the cow herself will triple in value. It has been estimated that the cost of placing an Advanced Register record on a cow ranges from $45 to $150, depending on the number on test, therefore, it is apparent that investments in Advanced Register work return liberal margins of profit.

Universal
natural milker

The Universal enables the dairy farmer to do more work with less men and at less cost.

The alternating action of the Universal milks two teats while relieving and massaging the other two.

The rubber-lined teat cup fits all cows.

The many Universal superiorities mean more contented cows, more milk, less bother, bigger profits.

You need but one Universal—it lasts a lifetime.

Learn about this simple, dependable, mechanical milker that enables one man to do the work of three—and do it better. It's mighty interesting reading for the dairyman who has an eye on profits.

150 POUNDS OF CALF MEAL OR GALLONS OF MILK?

THE fact that many thousands of America's farmers raise all their calves on Blatchford's Calf Meal—and have becn raising them on it for years—PROVES CONCLUSIVELY that calves THRIVE on it.

Blatchford's Calf Meal

Every pound of Blatchford's Calf Meal makes *one gallon* of rich milk-substitute. With milk selling *per gallon* for about **four times** the cost of Blatchford's Calf Meal *per pound*, a wise and economical thing to do is to raise your calves on Blatchford's.

WHY NOT test the "Blatchford Way" this spring? Try it on one calf only, if you prefer—but at least MAKE THE TEST. You are certain to be entirely satisfied with the way your calf will *grow* and *develop*—and the *money* you will save will open your eyes to the fact that the "Blatchford Way" is the sensible way, the economical way, the right way.

Get it at your local dealer's. If he cannot supply you WRITE US. We will refer you to some one near-by who can. Illustrated literature free on request.

LIVESTOCK SALE CALENDAR

Holsteins
Thursday, March 25, Guaranty Sale, Sacramento.
April 8, Breeders Sale, Tulare.
Wednesday, April 21, A. M. Bibens, Modesto.
Wednesday, May 12, Leeman & Kilgore, Dispersal, Ripon.
Shorthorns
April 17, Butte City Ranch, Butte City.
Berkshire Swine
April 17, Butte City Ranch, Butte City.
Poland Chinas
March 13, Haag & Bernstein, Hanford.
April 3, Kings County Pig Club sale, Hanford.
April 24, W. T. Dice and Harrold Waltz, Hanford.
Shetland Ponies
April 17, Butte City Ranch, Butte City.
Shropshire Sheep
April 17, Butte City Ranch, Butte City.

The preliminary survey of the entries for the Holstein Guaranty Sale to be held at Sacramento, March 25, indicates a total of about 80 head from more than 20 herds, making the largest number of cattle yet offered in this annual event. It is believed that when the complete entries are checked up the offering will be revealed as the most sensational yet made in the West, the offering of high record cows being particularly strong.

An official record of 32.35 pounds butter from 528.5 pounds milk in seven days has just been made by Minnewawa Louise 3d, a registered Holstein cow owned by James McGillivray, Sacramento. She is a daughter of the great old cow Minnewawa Louise, who has seven A. R. O. daughters, and is sired by Korndyke Pietertje of Oakwood, who will be remembered as the big white bull in the McGillivray show herd some years ago. Other good records recently made in the McGillivray herd are 26.31 pounds butter in seven days by Nadgy Korndyke Walker, a senior three year old daughter of Prince Butter Boy Walker; 22.30 pounds butter in seven days by the junior four year old Carlotta Aaggie Mona; and a record of about 25 pounds butter in seven days just being completed by Modjeska Crane 4th, a daughter of Aralia King Acme.

Troutbrook Pontiac Starin, a granddaughter of King of the Pontiacs, owned by W. J. Higdon, Tulare, recently completed an official record of 35.46 pounds butter from 531.5 pounds milk in seven days. Sir Skylark Ormsby Hengerveld Pet 2nd, another Higdon cow, increased her last year's 30 pound record to 32.30 pounds butter from 621.6 pounds milk, best day's milk 100.6 pounds. Herdsman Harry L. Redd has several other good looking prospects coming on, among them some daughters of Prince Riverside Walker, about to drop their first calves.

Alex D. McCarty, secretary of the California Poland China Breeders Association, has announced that the association sale which was to be held February 26 at Davis has necessarily been postponed. We presume the association will make announcement later as to future plans.

The consignment sale held at Lodi, Thursday, February 12, by the members of the San Joaquin County Poland China Breeders Association was one of the big disappointments of the present sale season. Only a small part f the offering was sold owing to the lack of a disposition to buy on the part of the local ranchers who were doubtless influenced by the unfavorable weather. The prices on the better stuff were fairly satisfactory, the top being $210, at which figure Eugene Miner got Miss Lodi, consigned by Beckman and Sons, Lodi. Mesdames Andrews and Hamilton of Modesto made a very excellent selection when they got King's Queen 2nd from the Lehman consignment at $205. Other buyers were: Les McCracken, Ripon; E. Archer, Lodi; Alberta Horan, Lockeford; W. O. Forbes, Napa; Dr. W. W. Fitzgerald, Stockton; W. J. Horan, Lockeford; E. E. Durston, Lodi; Hale I. Marsh, Modesto; G. R. Pierkert, Acampo, and W. A. Young, Lodi. Ord L. Leachman of Sacramento was the auctioneer and he was assisted by Fred Gatewood of Fresno.

George C. Aydlott, one of Hanford's leading business men, is founding a herd of pure bred Duroc-Jerseys. Mr. Aydlott owns a 600 acre ranch a few miles north of Hanford, and while his many business connections demand a greater part of his time he finds his greatest pleasure in improving and building up his ranch. He has been producing pork for a number of years but is now turning his attention to pure breds and has been a good purchaser at some of the fall and winter Duroc-Jersey sales. There is also maintained on the ranch quite a herd of Holsteins, part of which are pure bred. Grade Holsteins, like the Durocs, will have to go as Mr. Aydlott intends replacing all grades by pure breds just as rapidly as possible.

The third sale of the Fresno County Poland China Breeders Association was held in Fresno February 11. There was a noticeable increase in both size and quality over that of previous sales and the Fresno County breeders are making every effort to interest the farmers in their community in better hogs. Thirty-five head were sold for prices ranging from $75 to $230. The top of the sale was Black Favorite by Black Giant from the consignment of H. Barkema, selling to J. A. Arthur, Clovis. Mr. Arthur, who is establishing a herd, was a liberal buyer, securing a number of the top animals at very satisfactory prices. One of the features of the sale came from the consignment of W. L. Choisser, Riverdale, and was found in two sow pigs of September farrow, sired by Vaughn Jones by Gia t Jones at head of the herd of A. J. Van Cleef. One of these went to Lendorris Ranch, property of W. L. Haag and Son, Hanford, for $170 and Thos Caesar and Son, Reedley, paid $110 for the other. While the prices secured did not represent the true value of the animals secured the breeders demonstrated their faith in the future of the hog business in California. Geo. W. Bell of Tulare was the auctioneer.

In a recent letter from W. M. Carruthers, Live Oak, he says: "I have sold down on Berkshires until I have only 12 sows, some of them our old matrons that have produced many a prize winner. Two are sired by Rival's Champion; three are by Rival's Champion Best and the others are by Ames Rival 100th and Mayfield Champion. I have secured a new boar, a grandson of Rival's Champion Best out of Artful Belle 145th, an International grand champion bred by Mr. Spicer. We have been rather handicapped with our Berkshires on account of moving them twice during the last year, but at last we have them on alfalfa and before long we will be 'out among them again'"

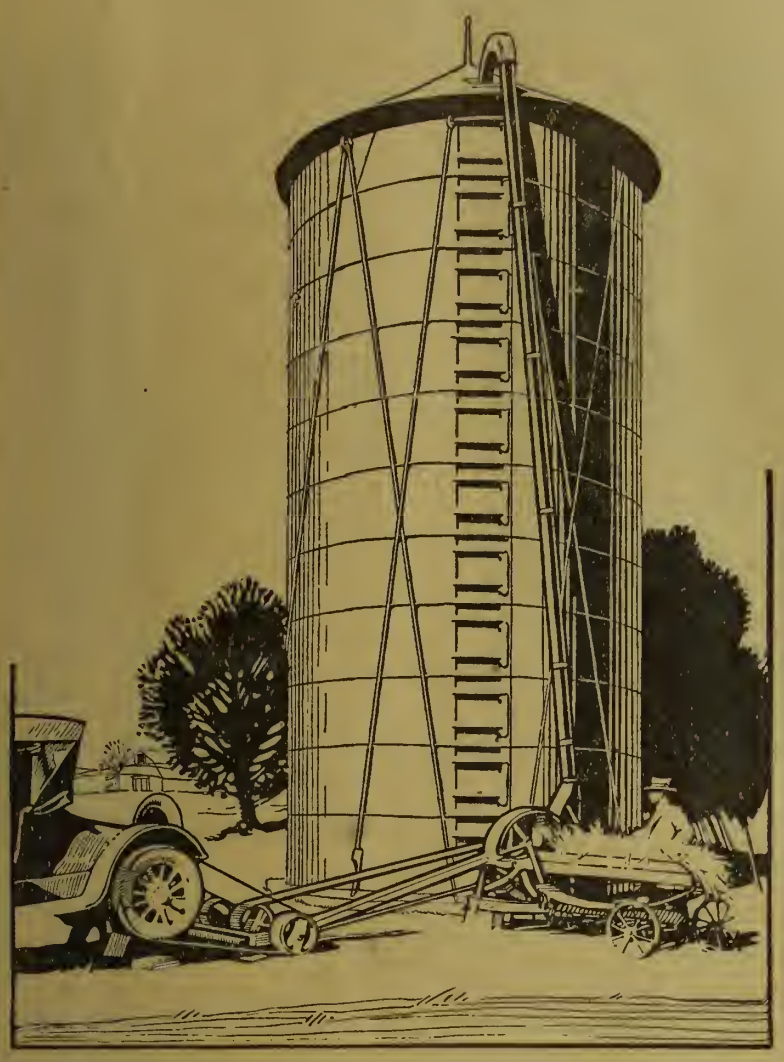
Clayton Slocum, Duroc breeder of Willows, writes that he has been forced to give up his trip East, having been delayed on account of moving to their new ranch. Slocum reports that he is having fine litters farrowed nearly every day.

In the recent sale of Berkshires, held at the state fair grounds, Sacramento, by H. C. Muddux and Son, a general average of $145 was established. The top sow was Rookwood Lady Double 2d, selling to R. Sims of Sacramento for $225. Melvin Boyd of Sacramento paid the top price, $195, for the boar, Meadow View Rival 3d. The sale was regarded as one of the best sales of Berkshires held in several years.

Mrs. Ruth Hardy, manager of Anchorage Farm, Orland, has sold a fine young Berkshire boar to F. W. Leavitt, owner of Packer Bend Farms, Butte City. Senator Leavitt is establishing a very excellent herd of Berkshires on his Packer Bend Farms and within the year expects to lay the foundation for a herd of Shorthorn cattle.

W. L. Haag and Son and John M. Bernstein will hold their second banner sale of Poland Chinas in Hanford, March 13. Viewed from the standpoint of blood lines, in all probability no sale this year will offer a greater or more desirable variety. Included will be found the blood of such sires as The Yankee, Liberator, Young Jumbo,

The Question of Silos



Write us for blue print instructions regarding the use of the automobile for power on the farm.

Own Your Own Papec

Present day conditions demand that all farming be done with the greatest possible efficiency. The Papec Ensilage Cutter is not only a farm necessity but a profitable investment, yielding big returns over a number of years.

The Papec is easy to set up and take down—operates on as low as 4 horse power; cuts and elevates at least one ton of green corn silage per hour.

When the loss of time and quality of ensilage due to depending upon a hired ensilage cutter and crew is considered, it is easy to understand why a Papec will pay for itself.

Santa Fe Lumber Co.

San Francisco, Cal.

The question of silos is not "Will a silo save money?" but "What kind of a silo will save the most money?"

The fundamental principle in preserving silage is to retain the moisture within the silo and keep out the air. In order to do this a silo must have three qualifications:

1. It must be air tight and water tight.
2. It must have strength to resist pressure from within which is 11 pounds to the square foot for each foot of silage depth.
3. Its inner walls must be smooth and perpendicular, for silage always settles a few feet, and if the walls are rough air spaces are left causing the silage to spoil.

The more perfect a silo is in these respects, the more money it will save for you.

The Simplex Silo

The staves of the "Simplex" Silo are furnished in ONE PIECE LENGTHS THE ENTIRE HEIGHT OF THE SILO, and have heavy tongues and deep grooves. When in place they form an absolutely air and water tight structure, incapable of leaking, without end joints. This is a "Simplex" feature.

The hoops of the "Simplex" Silo are made of new steel—not scrap iron. These together with the Interlocking Anchorage System—found only on the "Simplex"—securely bind the staves into one inseparable unit, defying inside pressure and high winds.

The material used in the "Simplex" is Clear Oregon Pine (Douglas Fir), which gives the inside surface of the silo the smoothness of a shot gun barrel.

Other exclusive "Simplex" features are: The Crissell Tangent Top, guaranteed to keep the silo in a true circle at all times; and the combination Hinge and Lift door.

When you buy a silo you have but one purpose in mind—to minimize your feed bill. When we designed the "Simplex" we had the same purpose in mind and we have accomplished it by building a Silo based upon the actual needs of the California rancher instead of building a silo merely to sell. Is it not worth your while to take this point into consideration when you buy a silo?

We await your inquiry for more detailed information. You can secure it by mailing the coupon.

Pure Bred Holstein Cows For Milk Producers

As long as farmers were content to sell whole milk for the price of the fat it contained there was room for discussion as to comparative value of the breeds. But the separator overcomes the necessity of selling milk in this unprofitable way.

For the wholesale milk trade, for delivering milk to condensaries or cheese factories, for the production of butterfat, the skim milk being retained to feed pigs and calves, thus preventing the depletion of the soil which never fails to occur where whole milk is shipped, the Holstein-Friesian cow is most profitable.

Raise Guinea Pigs
FOR US
We supply stock and buy all you raise. Laboratories need thousands, big money, easy to raise. Particulars and book 10c, nothing free.
DR. J. A. ROBERTS LABORATORIES
Hollywood, Cal.

The Cultivator costs only one dollar yearly

Liberty Bond, Buster Defender, Big Square Jumbo 2d, Vaughn Jones, Giant Jones, Miller's Long Chief and King's Big Bone Leader. This sale will also offer California buyers their first opportunity of securing at public sale Poland Chinas by the famous boar Liberator. Two boar pigs by this boar as well as three gilts by the celebrated Meharry boar, Big Square Jumbo 2d, will be included in the offering.

The fourth annual Inter-Mountain Stock Show will be held at North Salt Lake, Utah, April 5-7. Entries are limited to exhibitors in Utah, Idaho, Nevada, Western Wyoming and Eastern Oregon.

Thirty imported Shorthorn females and the bull, The Conqueror, have been sold by the importer, William Hartnett, for $85,000. The bull figured in the transaction at $25,000.

Shorthorn Blood Crosses Well

California Grizzly, a cross bred calf sired by a Shorthorn bull, third in class at the 1919 International. Bred and shown by the University of California. Shorthorn blood adds size, quality and early maturity. The Shorthorn grade is second only to the pure bred Shorthorn.

Seven hundred and fifty Hereford bulls and females will be offered in the annual Roundup Sale to be held at Kansas City next week. The sale is held under the auspices of the American Hereford Breeders Association.

Calves formed 21.9 per cent of the total receipts of cattle and calves at 50 markets in 1919, as compared with 18.5 per cent at the same markets in 1918. The total slaughter of cattle and calves at these markets included 29.9 per cent calves in 1919, as compared with 24.7 per cent in 1918. While receipts of cattle alone at these 50 markets in 1919 declined 6.3 per cent as compared with the receipts in 1918, calf receipts increased 15.8 per cent. The number of cattle slaughtered at these markets showed a decrease of 15.4 per cent, whereas the number of calves slaughtered increased 10.1 per cent.

There are 2,889 enthusiastic boys and girls in Idaho ready to testify to the profitableness of club work. Reports for 1919 show that the clubs' production amounted to $95,992.31. The cost involved was $38,087.70. The net profit was $57,904.61. The largest project was canning. A total of 111 clubs with 934 members canned fruit, vegetables and meat worth $34,909 at a cost of $17,181.

Minnesota claims the distinction of leading all other states of the Union in the number of accredited cattle herds. The figures given out by the state livestock sanitary board February 1 show 318 herds that have been tested and found free from tuberculosis. More than 2,000 Minnesota herds are now under test.

The Institute of American Meat Packers has issued the following special bulletin on the foreign situation. "The export trade of the packing industry, which is the largest industry in America, has practically ceased. The significance of this fact will be apparent when it is remembered that the United States normally exports a considerable part of its federally inspected pork products. Exports of pork products in the year just closed exceeded two and a half billion pounds. Since the last regular monthly review of the meat and livestock situation by the Institute, there has been no adequate improvement in the foreign exchange situation. This accounts for the present practical cessation of pork exports. Beef exports ceased some time ago.

Vaccine for immunizing cattle against blackleg is still in great demand. A report of the bureau of animal industry, United States department of agriculture, shows that 3,339,815 doses were distributed free to stock owners during the last fiscal year. The vaccine sent out by the bureau is in the powdered form.

Cross Bros., Poland China breeders of Merced, have recently added to their herd the yearling sow, Ohio Beauty by Blue Valley Big Bone and out of Mollie Big Bone, grand champion of Ohio, 1918 and bred to The Conqueror. She was selected for them by C. H. Walker, publisher Poland China Journal.

J. F. McSwain, Poland China breeder, Merced, and whose senior herd boar, Big Model Fellow was reserve grand champion at the last state fair, has recently secured the young boar McSwain's Long Chief. He has for his sire, Long Chief Again, grand champion of Indiana, 1918, and for his grand sire, Long Chief, grand champion in the same state, 1915. Mr. McSwain is of the belief that this young boar has added considerable strength to his herd.

Prime Shorthorn Beef

California Majestic, pure bred Shorthorn steer, bred and shown by the University of California and first in class at the 1919 International Live Stock Exposition, Chicag Shorthorn blood has been the greatest factor in improving the native cattle f America.

Todos Santos Ranch at Daggett steps into the ring for the first time in the Holstein Guaranty sale to be held late in March. Its first offering is to be Todo Santos Walker Pontiac, a fine young bull, a double cross of Prince Gelsche Walker blood. His three nearest dams average 30.95 pounds butter in seven days and his seven nearest dams average 28.61 pounds butter in seven days. His dam's full sister has just made 32.76 pounds. The little bull is now in charge of Charles Humphreys who will see him through the sale.

HOW TO IMPROVE YOUR LIVESTOCK

The United States department of agriculture, after analyzing the enrollment records of the first three months of the better sires campaign, announces that the data shows that the use of pure bred sires leads to the obtaining of blooded females also. The department sums up the factors which will hasten the improvement of the country's livestock and makes the following requests of the owners of livestock:

Use pure bred sires of good quality in all classes of livestock. Dispose of scrub, grade and inferior pure bred sires.

Keep breeding records. Many excellent animals of pure breeding have in the past been forced to rank as grades or scrubs owing to lack of records.

Join an active livestock association and attend fairs, exhibitions and judging contests where well bred animals of good type are shown.

Read good agricultural literature, including livestock and farm papers. The department of agriculture and the various states will send helpful bulletins on request.

Cooperate with your county agent, your agricultural college and other constructive forces in improving the quality of livestock in your community.

HOW FOREIGN COMPETITION AFFECTS DAIRY INDUSTRY

To meet foreign competition dairy farmers of the United States must be able to produce a better quality of product and produce and market it more economically and more efficiently, according to specialists in the United States bureau of markets.

Arrivals of shipments of Danish butter are already affecting prices on the New York City market. Argentine is producing nearly three times the amount of butter and cheese consumed, and some of the surplus may be expected to come to this country or compete with our products in foreign countries. Before the war Siberia was rapidly extending its dairy industry, and when conditions become settled in that country it may be expected to come back as a factor in the world's market. Recently there have been signs of interest in dairying in South Africa, and the industry as developed in New Zealand and Australia must be reckoned with.

If the dairy products manufactured in the United States are of a better quality than those from other countries they need not fear competition. Canada's cheese industry illustrates this. A strict system of government supervision in the training of cheese makers, in the operating of the factories, and in the grading, marketing and exporting of the product, exists there. This has tended toward an improvement in the quality of Canadian cheese until it ranks with the finest on the English markets.

The dairy industry in Argentina has grown rapidly since the beginning of the war. Before the war butter exports from that country totaled 3,262 tons a year; in 1918 they were five times that. Cheese exports were far exceeded by the imports in 1913. Now the conditions are reversed, over 6,000 tons of cheese being exported in 1918.

Today most of these exports are going to European markets, but should conditions become favorable it may be expected that some of them will come to this country. The bureau of markets warns dairymen to be prepared to meet this competition.

SPINELESS CACTUS

Prof. J. J. Thornber, botanist of the University of Arizona, gives the following rogarding spineless cactus:

"Spineless cactus is not native to Arizona. Spineless cactus has been grown under cultivation in a number of instances in small lots, but probably never with any degree of success. A small amount of money might be made from them as long as the joints could be sold at a good price for other people to plant and grow.

"Under Arizona conditions spineless cactus is not a very hardy nor a very rapid growing paint. The varieties which make the most rapid growth are injured severely by temperatures of eight or ten degrees Fahrenheit. If their growth bas been hastened during the summer season through abundant irrigation they suffer rather more severely from the winter cold than they otherwise would. Where they are given little or no irrigation during the summer season they suffer from heat and drouth. I am not able to give an estimate of a fair tonnage per acre, but under Arizona conditions it would certainly be low. With careful cultivation and irrigation at the university farm spineless cactus made a growth of three to six feet in height in three years time. Many of the individual plants weighed several hundred pounds each, but this forage was probably 90 per cent water. These plants were practically frozen to the ground with winter temperatures of ten degrees and 12 degrees Fahrenheit. Sandy soil is well suited to the growth of spineless cacti. The ordinary mesa soils in Southern Arizona, which are clayey in character, with considerable sand, are also well suited. My recommendation is that you will grow more forage and better forage on cultivated land if you will grow alfalfa or sudan grass, and that for mesa soils you will grow a great deal more forage by using Rhodes grass."

PROGRESS IN 20 YEAR EXPERIMENT

The 20 year breeding experiment which the bureau of animal husbandry is conducting in cooperation with the Kansas agricultural experiment station at Manhattan has been in progress since September 1, 1915. The principal objects are to determine whether the milking tendency in beef cattle is transmitted mainly by the dams through the male line of descent and to what extent this milk giving function of the dam influences the beef character of the progeny. Several steers and bull calves have shown unusual merit and have become prize winners of importance.

Experiments of the kind mentioned are particularly adapted to cooperative federal and state work. The great length of time necessary for satisfactory results in cattle breeding and the need for records of official character make it difficult for individual breeders to conduct the work in a manner likely to be of general value to the industry.

LOSSES FROM ANTE-PARTUM PARALYSIS

The state department of agriculture advises that pregnant ewes that are approaching parturition should be given special attention if this disease is to be warded off. A laxative diet should be given if possible, or if dry feed only is available keep the animals on a light ration for the last month of the gestation period. An excess of fat is a predisposing cause of the disease and must be avoided.

Do not wait until cases are developing in the flock. Prevent the tendency to sluggishness and excess fat by anticipating the danger a couple of months in advance. No medicinal treatment is of value, but the following very simple program, if followed out, will absolutely prevent the disease. Drive the ewes carefully once daily toward midday for a half mile or a mile to some pasture or grazing ground, preferably where some succulent food may be procured. Permit the animals to pasture for an hour and then return the flock to the original paddock. The exercise resulting from driving the band is the important part of the treatment, and even though no succulent pasture is available the drive should be made for the exercise alone. This tends to increase the appotite of the animals, increases the circulation, stimulates the muscles and liver, tones the alimentary tract and thereby relieves the tendency to constipation which is very commonly associated with the condition, and seems to be the factor that safeguards against the attack.

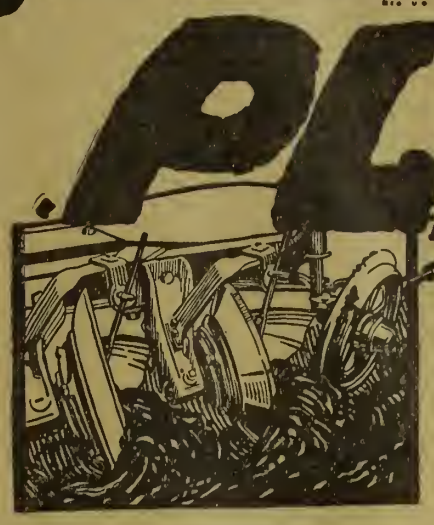
The cause of the disease is undoubtedly physiological. It is not due to any specific infection, therefore is not contagious in any sense.

The first symptom of the disease is dullness on the part of one or two well conditioned ewes in the flock ten or 20 days before lambing; they appear dull, remain away from the rest of the flock and do not eat; when approached they take no notice, or may shamble away if they are considerably disturbed; they continue to appear more stupid; the mouth becomes clammy and the eyes apparently sightless; the wool at times is found to have become loosened and within a day or two death ensues. The course of the disease from the beginning may run from eight to ten days. Probably in most cases the disease is not observed until the latter stages.

James McDonald, superintendent of Ormondale Ranch, informs us that he has just made the sale of a fine red Shorthorn heifer by Golden Goods, Jr., to Larco Bros., Peru, South America.

THE CATERPILLAR DISC PLOW

PLOWS



ANYWHERE—
Better and cheaper

NOT LIKE OTHER PLOWS

The "Caterpillar" Disc Plow is like other disc plows *only to the extent that the plowing is done with discs.* In every other respect, it is in a class by itself. *It is the only four wheel tractor plow. It runs like a wagon, steers like an automobile.* It has big, dust proof bearings, liberal clearance. The discs can be adjusted to *five different positions.* Side draft is overcome, *tailing entirely avoided.* Our new catalog gives complete details of this plow. Write for it!

Plows Anywhere—Built to meet Pacific Coast conditions, behind tractors of every type and size, the "Caterpillar" Disc Plow is suited for every kind and condition of plowing. It will plow the hardest 'dobe, the softest tule land or the toughest salt grass or Bermuda. It is the one plow that is really successful on the sidehills. It is the *only* plow for unusual work—and the *best* plow for ordinary work.

Plows Better—The "Caterpillar" Disc Plow pulverizes the soil properly—leaves it in the right condition to aerate. It plows deep—some owners plow as deep as 18 and 20 inches with it. Ridging is avoided. No unplowed strips are left, even on the turns. Under no circumstances does the tractor have to travel on unplowed ground.

Plows Cheaper—The "Caterpillar" Disc Plow saves power, because it is light of draft. It saves labor, because it is easy to handle. It saves repair expense, because it is built of the best materials, strong enough to stand up under the most severe work. For all these reasons, and chiefly because it isn't delayed by adjustments or breakdowns in the field, it plows cheaper.

DE LAVAL
Separator Savings

De Laval users are on the profit side

No machine used on the farm returns a larger profit on the investment than a De Laval Cream Separator.

It saves from 25 per cent to 50 per cent of cream twice a day every day in the year over crocks and pans; and from 10 per cent to 25 per cent of cream over an inferior or half-worn-out separator.

With butter-fat at the present high prices these savings mount rapidly. Many thousands of users have found that their De Lavals paid for themselves in a few months. De Laval users are always on the profit side of the ledger at the end of the year.

More De Lavals are used than all other makes combined.

Your local De Laval agent will be glad to demonstrate what an improved De Laval will save you. If you don't know the nearest agent, please simply write the nearest office below.

Hereford Points and Pointers

Continuing Hereford Points and Pointers, begun in the issue of the 14th and continued on Pages 288 and 289 of last week's issue, we give the remainder of R. R. Miller's article. Mr. Miller is a member of the American Hereford Breeders Association and is giving a valuable fund of information as to possibilities and wonderful advantages afforded by the Hereford.—Edit.

* * *

The price to be paid for a herd bull should be a secondary consideration. First find the bull that suits, then look at the price. It is practically impossible to obtain a tried and true herd bull at any price. One must ordinarily purchase a calf, yearling, or two year old and grow him out for the head of the herd. Often great herd bulls have been picked up from the pens at the stock yards and bought very cheaply, but most breeders now realize the value of their cattle and develop their herd bull prospects. The limit of price that one should pay for a herd bull depends upon the size of herd, class and breeding of females, but the fact must always be borne in mind that the degree of success attained is directly proportional to the kind of bull at the head of the herd.

In order to work improvement in a herd, the breeder must have some standard, some definite goal or ideal to which he aspires. The ideal should be set high enough that one will not become self satisfied and think that he can work no further improvement. As yet a perfect animal has not been produced and no matter how good they are, a competent judge can without prejudice find parts of the conformation or makeup of an animal that might be improved upon.

Too many breeders maintaining a herd of purebred cattle breed their cows to a pure bred bull, but pay no attention whatever to a proper mating of the animals. By such procedure, no progress will be made, except possibly by chance. The more likely result is a backward or retrogressive movement.

It is simple enough to breed the common, ordinary kind, but it takes deep study, patience and good judgment to produce the better classes and keep breeding them better all the time.

When an ideal has been set up, and the ideal should be nothing short of perfect, the breeder should make a careful survey of the herd, individually noting the deficiencies and objectionable qualities of each animal. Then measure up the poorer cows with the best and if the margin between them is too great, cull out and dispose of the poorer ones, replacing with others above the herd average. This should be done at least once a year. One is too apt to become acquainted with the strong points of his own cattle, paying no attention to their weaknesses at which places should be directed the initial move for improvement.

By all means endeavor to get a herd uniform in type throughout. The uniformity of a herd is the quality that impresses the buyer or visitor as soon as he sees the cattle. If he finds the cow herd uniform in type and the younger generations of the same stamp, his estimation of the herd is increased and a desire to own animals from such a herd is generated.

Breed character is the power of reproducing physical characteristics in animals. There is nothing more attractive in a herd than similarity of appearance. Such a sight shows immediately that sires of strong character have been utilized in the herd and that the breeder has a definite purpose in mind, whether the type chosen conforms to the visitor's ideal or not.

It is through the herd bull that continued improvement is carried out. He must be a good individual, much better than the average of the cow herd, of superior character and possessing the ability to impress his character upon his get, for unless he can sire uniform crops of calves of a better general average than the herd, then he should be immediately disposed of. The herd bull should be strongest in the points where the cows are the most deficient, for if the bull is not strongest where the cow herd is weakest, the necessary improvement will not result.

If possible, a new herd bull should not be put to heavy services in a herd until tried out, unless he is a tried and proven sire. Breed a few of the poorer and a few of the best cows to the bull intended for herd use and observe his calves before using him heavily.

Do not do as some breeders have done and buy a pedigree instead of a bull. The individuality should stand above all things. That should be the first consideration. No matter how perfect the pedigree, if the individual is deficient, a tabulation of his ancestors cannot be expected to produce good calves.

A complete record of the herd is of inestimable value in this regard. The record should be kept of the produce of each cow, the get of each bull, the age at which sold and the price of each. Through a study of these records and a knowledge of the value of the produce of each cow, a definite point is arrived at from which the breeder can start to cull his herd. This is essential as often the poorest looking cows produce the most valuable calves, both from the individual and a market standpoint.

Propaganda Hurts Production

By A. L. Spellmeyer

The next move for the farmer and the stockman will be to enter the propaganda game themselves merely as a matter of self protection against false impressions conveyed to the public.

We were inflicted with the packers' propaganda, but it has rather seemed to be a failure, and the advertising contracts are now devoted to the superlative qualities of various hams and bacons instead of condemnation of the federal trade commission or of lies as to the great prosperity and profit of stock raisers.

We are now experiencing a wave of statements put out in justification and self laudation of the railroads, their efficiency and low cost of handling products, etc.

Quoting from an advertisement of February 7, 1920, published by the Association of Railway Executives, there are several typical statements with just enough truth in them to make a wrong impression.

"The average charge for hauling a ton of freight is a cent a mile." This may be true, but it would be indeed great news for the West if such a base existed here. To haul stock in cattle cars from North Central Arizona to Los Angeles, or less than 500 miles, costs the stockman about $150 per 15 tons of cattle, or two cents per ton per mile. Perhaps the stockmen are getting the worst of it.

Again: "Beef pays only two-thirds of a cent a pound freight from Chicago to New York."

Of course this low beef rate is because the packers are the only ones who ship from Chicago the great quantities of dressed beef. The farmers and stockmen ship it to Chicago on the hoof and pay their contribution. To ship 15 tons of cattle on the hoof from a western point as far as New York from Chicago, not figuring Omaha or other packers' slaughter centers, would cost more than three times the price for transporting livestock in cattle cars, than the cost for transportation of dressed beef in iced cars.

We are told the freight charge of a suit amounts to but 22 cents, and on shoes is 5 2/3 cents, etc. Do these estimable gentlemen forget that a suit contains wool and cotton, that not only must freight be paid on the wool and cotton, but on the sheep and on the feed for the sheep and on everything the cotton raiser needs or uses. On the shoes it's a trifle, but the steers and the steers' feed has paid continued tolls, and then as a hide and also products used in making that hide, and food and labor. The largest single

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body — It is penetrating, soothing and healing, and for all Old Sores. Bruises, or Wounds, Felons, Boils, Corns and Bunions. CAUSTIC BALSAM has no equal as a Liniment.

Beef Cattle Specialist

For 30 years I have been devoting my entire time to pure bred beef cattle. I know where and how to buy. I make regular trips to the great producing centers and will buy on order. Best of references. Satisfaction assured. Correspondence Invited. R. M. DUNLAP, Hotel Land. Sacramento, Cal.

Correspondence with the advertisers in the California Cultivator will convince you that their articles will save you money.

contribution to general high cost of living was the raise in railroad freights, whether the H. C. of L. caused the raise or a guaranteed percentage on a vast amount of water, or other reasons.

Do these propagandists take the American people for gullible fools to swallow all these half truths and fact fragments? Let them keep their innuendo off the subject of meat and livestock products if they want to make it stick, as the cattle industry is unprofitable enough and sick enough not to be maltreated further. Between the railroads, the packers and the retail butchers, odium has been laid upon the producer who, in actual fact, has not made a living profit on cattle during the last two years. Thousands of men have quit the business and production needs stimulation.

CASTLEVIEW BERKSHIRES AVERAGE $133

The first public sale of Berkshires from the Castleview Ranch, Santa Rosa, resulted in the satisfactory average of $133. This sale which was the first ever held by a Sonoma County breeder was arranged by Mr. O'Connor to interest the ranchers of that community in better hogs, and while the local support tendered the offering was disappointing, the quality was such that breeders from all over the state were there to bid on the better things. The fact that Rookwood Lady 100th, grand champion at the 1917 National Swine Show, had been cataloged created marked interest in the event. She was secured by the Sandercock Land Company of Sacramento for $590, a very conservative estimate of her real value. Dr. H. C. Rieze of Cloverdale got the second top animal when he bid $275 for Castleview Princess L., a senior yearling daughter of the former champion, Baron Duke 201st. H. C. Muddux and Son of Sacramento paid $220 for Castleview Royal Princess, known in Berkshire circles as "Cutie." Cutie was one of the most talked about entries at the last state fair. D. J. Bastanchury of La Habra got one of the tops in Leader's Rival Lady, a daughter of Grand Leader 2nd, at $190.

The sale served to bring together a large number of distinguished breeders, and at the opening of the sale Chas. M. Talmadge of Washington, and a director of the American Berkshire Association, made a short address. He was followed by A. B. Humphrey, president of the Western Berkshire Congress, and several representatives of the press.

The sale was opened with a judging contest for women, which was won by Mrs. F. S. Peterson of Sebastopol.

Ord L. Leachman of Sacramento, cried the sale and was assisted in the ring by Frank B. Anderson, secretary of the Western Berkshire Congress.

Animals selling for $75 or more appear in the following list:

1. D. J. Bastanchury, La Habra, $190.
2. S. B. Wright, Santa Rosa, $100.
3. Mrs. Winslow Anderson, Kenwood, $75.
4. H. C. Muddux & Son, Sacramento, $125.
5. Italian Vineyard Company, Guasti, $115.
6. Butte City Ranch, Butte City, $75.
7. S. B. Wright, $125.
8. S. B. Wright, $75.
9. D. J. Bastanchury, $125.
11. S. B. Wright, $85.
12. Sandercock Land Company, Sacramento, $590.
15. Sandercock Land Company, $130.
17. S. B. Wright, $100.
18. A. B. Humphrey, Escalon, $100.
19. D. J. Bastanchury, $85.
20. Ratto Stock Farm, Napa, $135.
23. Ratto Stock Farm, $185.
24. Dr. H. C. Rieze, Cloverdale, $275.
25. Geo. A. Stengle, El Monte, $75.
26. H. C. Muddux & Son, $220.
27. J. G. Trockmorton, Santa Rosa, $105.

HOLSTEINS REGISTERED

Owing to the rapidly increasing number of Holstein-Friesian animals to be recorded, three volumes of the Herd-Book were published during 1919. The latest volume, which is No. 41, contains a record of 40,150 entries made from February 1, 1919, to June 1, 1919, 13,385 males and 26,765 cows. Volume 41 is now in the hands of the binders and will soon be ready for distribution. These figures bring the number of registrations that have been recorded by the association, June 1, 1919, up to the grand total of 781,810.

"FEEDFINE" FEEDS

are scientifically compounded in proper proportions for dairy and all livestock feeding, of the following ingredients with the most economical results always in view.

YEAST — A concentrate high in PROTEIN and FAT content, sterilized and predigested.

CANE MOLASSES — The richest of feeds in carbohydrates—produces increased appetite on account of its palatableness. Its consumption results in increased energy and it is the best tonic known for animals.

ALFALFA MEAL — Gives body to the ration and supplies the mineral matter which is absolutely essential to all animals.

The greatest known combination for health, strength and productiveness.

YEAST, CANE MOLASSES and ALFALFA

There Must be a Reason

for our rapidly increasing business. Our business is breeding the farmer's friend, the big type Poland China hogs.

Golden West King Grand Champion at San Francisco Livestock Show
Blue Valley King by Big Bone Leader

are boars that sire the kind of Poland Chinas that help us increase our business. If we didn't breed the right kind and absolutely satisfy our customers we couldn't increase our business. This is a good reason why you should be one of our customers. Write us.

A. Buckland & Son, R.F.D., Fresno, Cal.

SEQUOIA HERD of Big Type Poland Chinas

Senior Herd Boar—GIANT BOB, grand champion at state fair. Highest priced boar in the West and the sire of the right type of Poland Chinas.
Junior Herd Boar—THE SEQUOIAN, by Blue Valley Big Bone, a young sire of remarkable possibilities.

Z. M. DICKEY, DINUBA, CAL.

AV-I-A-TOR

represents the highest accepted standard of a Poland China boar. As breeders who have seen him say; he has everything to recommend him—nothing to condemn him. Get a sow bred to him. Merced County Breeders Sale, Feb. 21

CROSS BROS. MERCED, CAL.

King's Big Bone Leader

has amplified our greatest expectation as a sire of big type Poland Chinas.
GIANT BOB 2nd is a young boar of great possibilities.
We feel confident they represent the type most desired.

Les McCracken Ripon, Cal.

The Practical Test

of any breeder is satisfied customers. Recent sales to old customers indicate to me that my practical herd of big type Poland China sows headed by Forrestview Bob, a son of Caldwell's Big Bob, are producing the kind that satisfy. I will be pleased to satisfy you. Write me.

J. H. Cook Paradise, Cal.

THIS IS WHAT COUNTS

If you are raising hogs the quicker you can make 200 pounds of pork the more money you make. I breed Poland Chinas that mature quick.

BIG MODEL FELLOW—my herd boar was Reserve Grand Champion at last state fair. Buy a sow bred to this boar and secure both quick maturing and show qualities.

J. F. McSwain Merced, Cal.

You Can Buy Choice Pigs Now

from my herd of big type Poland Chinas I can offer some exceptional buys. Bred sows and gilts or pigs. First that write me will get some choice animals. Priced very reasonable. Write me at once for full description.

Exceptional Herd Boar For Sale.

Eugene Miner Lodi, Cal.

If It's Worth While

having stock on the farm it's worth while having pure breds. Our business is breeding Holsteins and big type Poland Chinas. We will be pleased to furnish you foundation animals of proven quality. Write us.

R. F. Guerin Visalia, Cal.

SOLD ON
10 DAYS' FREE TRIAL

No Risk of Loss

The only form of Nitrogen immediately available as plant food for growing crops is

NITRATE OF SODA

All other forms must first be nitrated in the soil, taking time, and resulting in costly losses through bacterial action. Use 100 pounds per acre for seeded crops and 200 pounds for cultivated. These light dressings are easily spread over an acre, and the amounts are very small compared to the acreage weight engaged in crop production.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Spreading Manure

A rents a dairy ranch to B who agrees to spread manure on the land. When the lease expires, he leaves 150 loads of manure in the barn and corral. B builds a porch on the house for which A agrees to pay at the expiration of lease. In settling A retains $50 to pay for the spreading of manure. Can B collect the $50? All agreements were verbal.—Subscriber, Turlock.

The mode of judicially determining the matter would be for B to bring suit for $50 and for the costs of building the porch, whereupon A could counter-claim for the actual costs of spreading the manure. It is quite probable that the agreement to pay for the building of the porch would be void under the statute of frauds, being a contract with relation to real property, however, it would depend upon the exact nature of the contract to be developed in the evidence.

Eucalyptus Trees on Street

There is a row of eucalyptus trees six feet from the public street upon my land. I am told that the supervisor would not allow me to cut these trees. My fruit trees, 30 feet from the eucalyptus, are being killed out. Has the supervisor any legal right to stop me from cutting the trees? I wish to replace them with fruit trees. If I could not move all of them could I remove some of them? Could I legally dig a ditch cutting off the roots between the euclayptus and the fruit trees, if so, how close could I dig this ditch to the eucalyptus? There is an electric line running close to the trees. If this ditch should weaken the trees so that they would blow over on the wires, would I be liable for the damage?—Subscriber, San Diego.

If the eucalyptus trees are actually upon your land and outside of the public road, the supervisor has no authority whatsoever, and they could be cut down by you just the same as you would cut down your fruit trees if you so desired. I take it, however, that they must be upon the road right of way. In such case, you would require the permission from the supervisor in his capacity as road commissioner to remove any of them. As to cutting the ditch, the supreme court of this state has twice decided that the branches overhanging and the roots projecting into the soil adjacent to the land whereon the trees grow, are the property of the owner or occupant of the land, and while this owner or occupant may not cut down the trees, he can cut off the branches which overhang his soil and is entitled to whatever these branches produce. He may also abate the roots projecting into his soil by digging a ditch on his boundary line and cutting off these roots. While there seems to have been no decision in respect to liability in case the trees should fall after cutting the roots projecting into your land, it would seem in reason and theory that there could be no liability upon your part, as there is no obligation upon you to furnish a support for trees growing on other property. If the supervisor desires to have the trees growing there, it would be the duty of the county to protect the public as well as your own property. To avoid any question of liability, you might bring an action or injunction to restrain the supervisors from permitting the roots of these trees to permeate your land, asking for an order requiring to cut these roots, which is the of action wherein the supreme court passed upon the points above stated.

Patented Water Right

I am writing to see if you can give me any information on whether there is such a thing in existence as a patented water right. I have been farming here in Soledad Canyon, using water for irrigation from the Santa Clara Creek for nine years, and now the ranch above me has changed hands and the new owner claims a patented water right. The water in question is to be taken out and used on an old homestead on which the water has not been used for seven years. I complied with the law in my water filing when I homesteaded here. —Subscriber.

It would certainly seem that if there is any such thing as a patented water right, it is in your possession and not in the possession of the new comer on the property, as you have acquired it not only by the appropriation but also by actual use. Probably the best means for you to take will be for you to file a petition with the state water commission to investigate the rights of water on this creek. It will thereupon send a man to make a thorough investigation of the matter and a decision will be made which will clear these rights.

RURAL COMMUNITY BUILDING

The United States department of agriculture has issued Bulletin 825, "Rural Community Buildings in the United States." It was compiled by W. C. Nason, assistant in rural organization. The bulletin refers to the growing interest in community buildings. This is a feature "so recent and so essentially an outgrowth of rural life and conditions that knowledge regarding it necessarily has been fragmentary." However, several examples, located in various states of the Union, are referred to as indicating, or even giving proof, of the value to rural life of such community centers.

These community buildings are classified according to source of funds for their establishment. These include buildings financed by local manufacturing concerns through individual donations, through club or society initiative, or sometimes financed by local government, and again through community endeavor. The character of these buildings, methods of maintenance, operation and management, and the uses to which they are put, such as recreational, gymnastic, athletic, social, even political, cooperative and religious, are described. Then follow specific examples of community buildings located at Holden, Massachusetts, Matiecock, Long Island, Elgin, Nebraska, Kentfield, California, Red River, Minnesota, and other points.

These buildings have been established in communities of from 500 to 30,000 people and, in fact, the greater number, 83 of them, have been established in what is termed open country without sufficient inhabitants to be classed even with the less than 500. The bulletin will have particular interest for people in isolated communities, or rather in communities which are not now provided with proper assembling place, whether through schools, churches or other organizations.

GOING WITH THE WIND

"It's an ill wind that blows nobody good," said the ready-made philosopher.

"Yes," replied Cap'n Starboard; "but the kind of man that sits around waitin' for the wind to come from exactly the quarter that suits him is mighty likely to have no more sense than to hoist sail in a hurricane."

DOING FINE

Dick, whose father drives an automobile, is much interested in the operating of the car, especially the position of the gear shift lever. One day when some one asked him how his little sister, who was sick with the flu, was getting along, he replied: "Oh she is getting along fine; her fever was down to neutral this morning."

Irrigated Tulare County Land at $125. per Acre

Irrigated Land Ready for Summer Crops in the Rich County of Tulare, at $125 to $150 per Acre and On Easy Terms

3000 acres in 40 and 80 acre tracts, with water shallow lift, electric pumping plants, reservoirs, small buildings and sheds for stock; all fenced; near State Highway, schools and church. Some plowed and ready for summer crops. Between Pixley, on S. P. R. R. and Spa, on the Santa Fe R. R.

Suitable for rice, cotton, barley, wheat, sugar beets, broomcorn, peaches, pears, prunes, apricots, olives, figs, raisin grapes, almonds, walnuts, persimmons, alfalfa, dairy or hogs. Ducks thrive on the reservoirs; good range for turkeys and chickens.

For 60 days price $125 to $150 per acre. No higher. Terms one-fifth cash, balance on or before five years at 6 per cent interest on deferred payments.

This is your opportunity to purchase choice Tulare County land under irrigation that will pay for itself from the beginning. If interested, this offer should be investigated immediately.

J. M. DAVIS,
Pixley, California

AUSTIN

FARM DITCHER, TERRACER AND ROAD GRADER

A machine that will save you money and labor. It is the ideal implement for digging drainage ditches. It cuts a mile of V-shaped ditches to a depth of four feet, in a day.

The **Austin** Ditcher is unequaled for terracing hillsides, backfilling ditches and grading and repairing roads.

This handy implement is inexpensive and will prove the busiest and most useful machine you have. Write today for illustrated folder.

F. C. Austin Company, Inc.
Dept. K , Railway Exchange Bldg., Chicago

Place Your Order NOW for Nitrate of Lime

Guaranteed not less than 13 per cent Nitrogen—almost 100 per cent Pure.

Nitrate of Lime supplies Nitrogen in the most available form. Packed in solid wooden casks about 240 pounds.

Ask for prices, delivery from warehouse, Los Angeles and San Francisco, or steamer, January, 1920.

Pacific Coast and Hawaiian Islands
311 California St., San Francisco.

Tractors for Subsoiling

By Arthur L. Dahl

IT has come to be looked upon as good agricultural practice to plow deeply every few years, to break up the hard stratum of packed soil caused by shallow plowing, and to make available for the root systems of plants the added nourishment to be secured from the deeper soils.

In orchard practice this subsoiling is even more important because the tree roots penetrate the soil to a greater extent than annual plants and the condition of the top soil, drainage, acidity and many other factors are largely influenced by the handling of the subsoil.

Almost all orchard owners believe in the efficacy of subsoiling, but to many of them the plan does not appear feasible because the power required is more than is available on their own places, but since the advent of the big tractors, with horse power ratings up to 60 or 70, the problem of conducting subsoiling operations on the average orchard does not appear so difficult.

During the last few years a number of experiments have been conducted in the orchards of Tulare County to determine the best means of subsoiling, the cost, and the benefits to be derived, and some of these experiments are of interest to all orchard owners. Those who have watched the tests in that district are convinced that deep subsoiling of orchards is a real investment that will return dividends to the owner.

The Tulare County experiments were largely the result of the deep interest and untiring efforts of E. L. Tobin of Lindsay who spent several years in trying various methods and in devising a subsoiling machine that would prove successful. The first two machines proved unsatisfactory, but the third, built especially for the work, proved satisfactory, and this machine is doing excellent service in various parts of the state.

The subsoiler weighs two and a half tons and is operated with drums and cables arranged to hold the blade in the ground and yet to release it quickly when pipe lines or other obstructions are met.

The submerging blade is five feet long and two inches thick and made from Norway steel. A shoe four inches wide and two feet long appears at the bottom, to which is attached the digging point. This point is removable and must be replaced every few hours as the hardpan wears it away as quickly as an emery wheel. To operate the subsoiler required the combined power of two machines, one of 75 horsepower and the other of 45.

The outfit required the services of six men, but wonderful results were secured on the 1,350 acres of land plowed in the Lindsay district. The machine covered from ten to 12 acres a day and plowed an average of over three feet, frequently going five feet under the surface. So powerful was the outfit that where hardpan lay close to the surface the blade tore it up for a distance of three or four feet on each side of the furrow and often large blocks of hardpan were pulled to the surface and exposed.

The use of this outfit cost the orchardist about $15 per acre for subsoiling two ways, or tearing up the soil between the tree rows in both directions, and where the hardpan existed under new orchards some of the owners found it advisable to use the subsoiler twice over the same area to thoroughly break up the hardpan and enable the tree roots to penetrate below.

As examples of the benefits derived from the subsoil operations in the Lindsay district one owner reported that it required four times as long to irrigate the area subsoiled as previously, but in a few days the trees made more new growth than they had for the preceding two years. On another orange orchard it had previously been impossible to successfully grow a cover crop, but after the owner had subsoiled half of the grove as an experiment a volunteer cover crop sprang up on the part subsoiled and grew to a height of three feet. On the area not subsoiled no cover crop whatever was secured.

While the Tulare experiments demonstrated the value of subsoiling lands underlain with hardpan at a depth which can be reached with the machine, the practice would undoubtedly be beneficial on lands not so handicapped by hardpan, for the practice would result in allowing the soil to be aerated to a greater depth than with ordinary plowing, and to that extent it would keep the soil sweet and in good condition. The practice would also increase the food area for the roots and enable the trees to become more hardy and better developed. On lands containing alkali or other injurious mineral salts the subsoiling would improve the drainage conditions of the orchard and permit of the leaching out of a considerable part of these deleterious salts.

There are a number of districts in California where the development of wild lands is largely dependent upon the overcoming of the hardpan menace. In some cases this hardpan occurs from a few inches to two feet below the surface, and underneath it is a fine body of loam that is capable of furnishing a large amount of plant food. In the breaking up of this shallow hardpan a number of experiments have been tried, some of which have been successful. For instance, in the new fig district of Fresno County, where hardpan occurs near the surface, the planters have found that they can break it up sufficiently to use for orchards by drilling holes with a portable drill mounted on a tractor and moved from point to point quickly by the machine. By drilling a small hole and then inserting a charge of dynamite the hardpan is quickly and effectually shattered and at a moderate expense the entire area can be made ready for the trees.

With the successful performance of a deep subsoiling outfit such as herein described, and with ample power supplied by one or more large tractors, it is not too much to expect that large areas of land not heretofore utilized for cultivation, or orchards, can be added to the productive area of our state by breaking up the hardpan and rendering available for plant growth the richer soils that lie below. The successful operation of such an outfit, however, is entirely dependent upon an adequate source of power, such as the large tractors, for animal power would be too unwieldy to handle.

That subsoiling is productive of increased returns in ordinary agricultural operations is shown by the experience of Robert A. Todd of the Imperial Valley.

In describing his experience, Mr. Todd said: "Before using the subsoiler my crops of grain were unsatisfactory both as to quality and quantity of production. I have the medium type of soil, and previous to purchasing the subsoiler I disked the land as deeply as possible and seeded and irrigated according to the best farming practice in the Imperial Valley and believed I was getting good results." About this time, however, Mr. Todd learned that he might improve his crops by subsoiling, and after considerable thought he bought a machine for doing the work. Continuing, he said: "Last season I subsoiled every acre of my land, thoroughly pulverizing and aerating the soil. Then I planted and irrigated as I had done before. The result was marvelous. One piece of land that produced 12 sacks of barley the year previous yielded 27 sacks of early Baart wheat, weighing 140 pounds to the sack and testing 61½ pounds to the bushel." In the operation of his subsoiler, Mr. Todd used one of the heavier types of tractors, for he found that it would be impossible to manage a sufficient number of horses to pull the outfit.

When one visits the cane fields of Hawaii the large number of heavy tractors or steam plows will excite comment. This practice is largely due to the necessity for plowing the soil for sugar cane much deeper than is practiced in the United States, and only the heavier power machines can stand up under the work. This type of work is virtually subsoiling, for the plows penetrate deep into the ground and open up for the cane roots an ample source of plant food for the entire growing season of 18 months, until the cane is fully mature and ready for cutting.

TOP DRESSING TALKS

Increased Profits from the Orange Grove

In an orange grove on the Chase plantation of the American Fruit Growers, Inc., a fertilizer demonstration was undertaken in 1918.

Arcadian Sulphate of Ammonia was applied to one plot at the rate of 5 pounds per tree per acre in four equal instalments—March, April, June and September.

The picking record is as follows:

Treatment	Total yield from 46 trees
Without Sulphate of Ammonia	209.8 boxes
With Sulphate of Ammonia	242.9 boxes

Figuring on an acre basis (87 trees) the Arcadian Sulphate of Ammonia produced a gain of 62.6 boxes, which at $2.00 per box amounts to $125.00 per acre. The cost of the fertilizer was $28.27 per acre.

Arcadian is a quickly available non-leaching form of nitrogen, especially suited to California soils. Its fine dry crystals make application easy by hand or by machine. Ammonia 25¼ per cent guaranteed.

Write for free bulletin "Citrus Fertilization."

How to Make Them Like New

If you have an old manure spreader which has worn gears which you cannot replace or which have been breaking frequently with inconvenience and loss to you, do away with the main gears and mount a 4 H. P. Cushman engine to drive the mechanism.

Easier on team and machine—saves time and money. Engine can be quickly taken off and used for any chore work on the farm.

The Cushman will do more kinds of work than any other farm engine made. Will operate grain or rice binders, potato diggers, mowers, reapers, headers, corn binders, as well as doing all kinds of stationary work.

Write for information.

Tomatoes: Mexicans: crates, best, 2.00@2.25; lugs, repacked, 2.00@2.50; originals, 1.75@1.85; poorer, 1.00 and up; per lb., poor condition, 6@10; mostly 6@7.

Turnips: Per dozen, 40@60; per sack, 3.50@4.00.

FRUITS

These are the actual prices obtained February 24, by the Los Angeles wholesalers in sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Apples: 4-tier Bellefleurs, best 2.00@2.25; quality and condition ordinary 1.85@2.00; 3½@4½ tiers, 1.50@1.75; loose 3@5 lb. Yellow Newton Pippins, 4 tiers, 2.00@2.50; 3½ tier, 2.35@2.50; per lb., 4½@6; Winesaps, 3.00@4.00; loosc, 5@7 per lb.; Delicious, 2.50@3.50; fancy large sizes, 3.50@4.00; 5@7 per lb.; Wh. Pearmain, best, 2.50@2.75; other, 2.25@2.50; lb., 5@6.

Bananas, 8@8½; Red, 9.

Cranberries: Barrels, 18.00; best shipping, 18@20 per lb.

Pears: Winter Nelis 6½@7½ lb.; bx., 3.00@3.50.

Grapefruit: California and Arizona: per box, 3.00@4.00, mostly 3.25@3.50. Local, 2.00@3.00 per box.

Lemons: Market stronger. San Fernando Valley stock; fancy packed, 5.25@5.50; loose, 3.50@4.75; juice, 2.50. Local stock; packed, 2.50@3.00; loosc, 2.00@2.25 box; 2@3 per lb.

Oranges: Navels, 3.75@5.25 box. Local stock: packed, 3.50@4.25; large sizes low as 2.00@3.00. Tangerines, lb., 6@8.

HONEY

Demand and movement good, market steady. Carloads f. o. b., usual terms, per lb.; white orange blossom, mostly 19; white sage 19@20; extra light amber sage 18½; light amber sage, supplies cleaned up; light amber alfalfa, 16½. Beeswax, local lots, 40@43.

WALNUTS

Net prices have been named by California Walnut Growers' Association.

No. 1, 31½.
No. 2, 26.
Diamond Brand Buds, 34.
Golden State Buds, 34.
1918 No. 1 price was 28; fancy budded, 31½.

BEANS

California Lima Bean Growers' Association fixed prices October 6: Limas, 14½; baby, 13.

F. o. b. L. A., carload lots. Market sluggish, outlook hopeful. Limas, 13.25@13.50; Baby Limas, 13.00; Blackeyes, 7.25; Small Whites, 6.30@6.50; Large Whites, 6.50@6.75; Pinks, 6.90@7.00.

HAY

Rains all over the South prevented a further rise but vastly heavier rains are needed to effect any decline.

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices:

Tame Oats	25.00@28.00
Barley	25.00@29.00
Alfalfa	25.00@30.00
Barley Straw	10.00@13.00

GRAIN AND FEEDS

Price bid local grain exchange, February 10.

Oats, Cal. Feed, 3.20.
Barley, 3.32@3.42.
Corn, Yellow, 3.17½.
Eastern Kafir, 2.40.
Wheat, mixed feed, 4.75@4.95.
Milo, 2.91@2.97; Eastern, 2.40 @2.55.
Shorts, Kansas, 56.00.

San Francisco Markets

San Francisco, February 24, 1920.

BUTTER

Quotations made daily by the San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

POULTRY

Wholesale prices are:

Leghorn, 41@43; small, 41@43; large, 41@43; roosters, young, 43@45; old, 21@23; broilers, 45@50; fryers, 45@48; turkeys live, 42@43; dressed, 52@53.

Ducks, Indian Runner, 25@27; Pekin, 33@35; geese, 30@32; Squabs, 70@75.

Belgian hares, live, 20@23; Jack rabbits, dozen, 1.50@3.50.

LIVESTOCK

Western Meat Company are:

Cattle—Grass steers, No. 1, weighing 1000 to 1200 lbs., 12@12½; do 1200 to 1400 lbs., 11½@12; do, second quality, 9½@10½; thin, 8@9.

Cows and Heifers—No. 1, 9@9½; second quality, 8@8½; common to thin, 4½@5.

Calves—Light weight, 12½@13; medium, 11@11½; heavy, 9@9½.

Hogs—Weighing 100 to 150 lbs., 15; 150 to 225 lbs., 15½; 225 to 300 lbs., 15; 300 to 400 lbs., 14.

Moran & Co. quote prices on livestock, weighed and delivered off cars at their plant, South San Francisco, as follows:

Cattle—Good steers, 1000 to 1100 lbs., 12@12½; top steers, 1100 to 1200 lbs., 11½@12; good heifers, 1000 lbs and over, 9@9½; No. 2 cows, 1000 lbs. and over, 8@8½; canner cows, 5@6; good bulls, 6@7. 15¾; 225 to 300 lbs., 14½; over 300 lbs., Calves—Light, 13@14.

Hogs—Top packer, hard and well finished; 100 to 150 lbs. 14½; 150 to 225 lbs., 13½; under 100 lbs. 13½.

Sheep: Ewes, 9@9½. Wethers, 11@12. Yearlings, 13@13½. Milk Lambs, 14@15.

POTATOES

Wholesale selling price:

Per 100 lbs.: Rivers, fancy, 4.50@4.75; choice, 4.25@4.50; Idaho Gems, 4.50@5.00; Salinas, 5.25@5.50; sweet, 4½@5 per lb.

ONIONS

Wholesale selling price:

Onions, fancy brown, 4.75@5.00; choice, 4.50@4.75; yellow, 5.00@5.25; white, 5.50. Garlic, China, 14@15; other, 25@30 lb.

VEGETABLES

Wholesale selling price:

Artichokes, No. 1, 90@1.00; No. 2, 65@80; No. 3, 40@55.
Asparagus, lb., 40@50.
Beans: So., 13; Hothouse, 75 lb.
Carrots, per sack, 1.00@1.25.
Cauliflower, doz., 1.25@1.45.
Cabbage, doz., 40@50; lb., 2½@3.
Celery, doz. bunches, 45@50; cr., 5.00@7.00.
Eggplant, lb., 15@20.
Lettuce, cr., 1.50@2.00; Imp., 2.50@2.75.
Peppers, Bell, lb., 20@25; Fla., 25@30.
Peas, lb., 8@12½.
Radish, 7@9 doz. bunches.
Tomatoes: Southern, 2.75@3.00.
Spinach, lb., 2½@5.

DECIDUOUS FRUITS

Apples: Bellflowers, 1.25@1.50; Newtown Pippins, old stock, 1.25@1.50; California storage, 4-tier, 2.00@2.25; Oregon, 2.00@2.50; Spitzenberg, choice, 1.75@2.25; fancy, 2.50@3.00; Baldwins, 1.75@2.50; Winesaps, fancy, 3.75@4.00.
Bananas: lbs., 8@10.
Pears: bx., 1.50@3.50.
Pineapples: doz., 3.00@5.00.

CITRUS

Wholesale selling price:

Per box: Lemons, fancy, 5.00@5.50; choice, 4.00@4.25; standard, 2.50@3.00; lemonettes, fancy, 3.00@3.50; others, 2.00@2.50; grapefruit, fancy, 2.50@3.00; choice, 2.00@2.50; navel, 4.00@5.50; limes, 1.00@1.50 per crate; tangerines, 1.50@3.25 per crate.

BEANS

Jobbing price per cwt.: Small white, $6.50; large white, 6.00@6.50; cranberry, 7.00@7.25; red Mexican, 8.50; pink, 6.75@7.00; California Bayo, 9.25@9.75; blackeye, 7.00@7.50; red kidney, 12.00@13.00; lima, 13.25@13.50; Garvanza, 9.50@10.50; Kotenashis (in bond), 5.35.

Dried Peas—California, 5.25@5.40 per cental for green, recleaned.

DRIED FRUITS

Prunes:

Prune prices announcel by the California Prune and Apricot Growers, Inc., were for the base prices, according to sizes, and are: 20-30s, 22c flat; 30-40s, 16c; 40-50s, 14c; 50-60s, 12c; 60-70s, 11½c; 70-80s, 11c; 80-90s, 11c; 90-100s, 11c. One cent a pound premium will be paid on fruit delivered before September 20. On small-sized fruit 8½ cents a pound will be paid for 100-120s and 7½ cents for 120s and smaller.

Peaches:

Peach prices announced by the California Peach Growers, Inc., for 1919 crop dried peaches for the domestic and foreign trade; September, October, November shipment, seller's option; guaranteed against our own decline until January 1, 1920, are as follows:

Standard yellows, 14¾c; Muirs, 15c.
Choice yellows, 15½c; Muirs, 15½c.
Fancy yellows, 16½c; Muirs, 17½c.
Extra fancy yellows, 17¾c; Muirs, 18¾c.
Slabs, yellows, 14½c.

For "practically peeled" add 1½c per pound (any grade).

Prices above are all bulk basis.

For packing in 50 pound or 25 kilo boxes add 1 cent per pound.

25 pound or 12½ kilo boxes, all 1¼c per pound.

10 pound boxes, add 2c per pound.

Blue ribbon peaches packed 2 pound cartons, 24 per case, $10 per case.

Bakers' special, "practically peeled," 16¾c per pound, bulk basis.

Apples:

Choice (in 50s), 20@20½; extra choice (in 50s), 21@21½; fancy (in 50s), 23@23½.

Figs:

White: Cooking (in 50s), 15@16; choice (in 50s), 17@18; extra choice (in 50s), 19@20; fancy (in 50s), 21@22; extra fancy (in 50s), 23@24; bricks, 12 No. 10s, 1.60@1.67½; bricks, 24 No. 8s, 2.55@2.65; bricks, 50 No. 6s, 4.00@4.15; bricks, 70 No. 4s, 4.20@4.35; layers, No. 10, 2.50@2.80. Calimyrna: Cooking (in 50s), 19; choice (in 50s), 23; extra choice (in 50s), 24; fancy (in 50s), 26; extra fancy (in 50s), 27½; bricks, 10 1-lb., 2.75; layers, No. 10, 2.95@3.20. Black: Standard 14, choice 17@18; extra choice, 18@19; fancy, 19@20.

Pears:

Standard 20, choice 22½; extra choice, 24; fancy, 26@27.

Raisins:

California Associated Raisin Company's prices guaranteed to January 1: Seeded: Sun-Maid, 16s, package, 15; fancy, 16s, package, 15; fancy, 12s, package, 11¾; choice, 16s, package, 14½; choice, 12s, package, 11⅜; bulk, fancy in 25s, 14¼; bulk, bakers, in 25s, 13½; bulk, Malagas and Feherzagos, in 25s, 13. Loose Muscatels: 4-crown, in 25s, 14¼; 3-crown, in 25s, 13¾; 2-crown, in 25s, 13¼; 1-crown recleaned, in 25s, 14. Seedless: Thompsons, 16s, 15½; Thompsons, 12s, 12½; Thompsons, bulk, recleaned, in 25s, 14½; Thompsons, bulk, bakers, in 25s, 15½. Bleached Thompsons: Choice, in 25s, sulfur, 18; fancy, in 25s, sulfur, 18½; extra fancy, in 25s, sulfur, 21; soda dipped, in 25s, 17¾; oil dipped, in 25s, 17¾. Sultanas, 16s, 15¼; Sultanas, bulk, in 25s, 14¼. Layers: 6-crown, flat pack, 20s, per box, 4.05; 6-crown, flat, 10s, per box, 2.20; 6-crown, flat pack, 5s, per box, 1.20; 4-crown, flat pack, 20s, per box, 3.20; 4-crown, flat pack, 10s, per box, 1.75; 4-crown, flat pack, 5s, per box, 1.00; 3-crown, tray pack, 20s, per box, 3.10; 3-crown, flat pack, 20s, per box, 2.95; 3-crown, flat pack, 10s, per box, 1.60; 3-crown, flat pack, 5s, per box, 95; clusters, 20-1s, cartons, 3.45; clusters, 12-2s, cartons, 3.80; clusters, 4-5s, cartons, 4.50; vineyard run, 100s, 18.00.

GRAIN

Wheat: The prices are based upon federal grades and standards at the terminals in San Francisco Bay and Los Angeles, and are as follows, per bushel of 60 pounds:

Hard White—	Per Bushel	Per Cental
No. 1	$2.20	$3.66 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.18	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.09	3.48½

The above are minimum prices.

For sacked grain add 4½ cents per bushel of 60 pounds to above prices. Deductions of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.20@3.30; black, 3.00.

Corn: California yellow, 3.10@3.20 per cental; Egyptian white, 3.75@3.80; milo maize, 3.15@3.25.

Barley: Spot feed, per cental, 3.50@3.60; brewing, 3.65@3.75.

HAY

Under date of February 21, Scott-Magner & Miller says:

Receipts past week, 1,884 tons. The increase of shipments this week has been caused by quite a bit of hay coming in to be pressed for government account and a little demand in export shipping. Stock owners have gone to the various country storage centers and have been buying up to a price of $35 per ton in country warehouses for almost any grade of good feed hay. News of this trading has stiffened up the market in San Francisco and prices have advanced from $3 to $5 a ton on different grades of hay. The slight showers of the last two days have raised the hopes of many but have so far accomplished very little practical results to help the situation. The prospect is extremely dubious and gloomy from the standpoint of the consumer of forage of any description. Alfalfa has been in chief demand and large quantities have been shipped in during the week from Nevada. This has gone all over the state indiscriminately even as far as the extreme southern districts. It is a salvation to the feeders that we are able to draw on the Nevada market even at these extreme prices. Straw is unchanged with practically no demand.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses are to be added according to conditions:

Fancy Wheat Hay (light 5 wire bales)	33.00@36.00
No. 1 Wheat or Wheat and Oat Hay	30.00@33.00
No. 2 Wheat or Wheat and Oat Hay	28.00@30.00
Choice Tame Oat Hay	32.00@35.00
Other Tame Oat Hay	28.00@32.00
Wild Oat Hay	28.00@32.00
Barley Hay	28.00@32.00
Alfalfa Hay	30.00@35.00
Stock Hay	24.00@27.00
No. 1 Barley Straw	.50@ .80

Citrus Markets

Los Angeles, February 25, 1920.

Careful estimates indicate around 7,000 cars of navels yet to go. There are about 100 cars going forward daily. This is hardly sufficient for market needs and a stiffening of the market is noted. Some auction sales are running as high as $10.00. F. o. b. quotations when made are around $5.00 and $5.25. This for regular sizes and best brands.

The lemon market is still holding up and notwithstanding 60,000 boxes of foreigns are enroute Californias are being picked up as soon as offered. Prices in auctions are ranging all the way from $4.50 to $9.25.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 7,605 cars; lemons, 1,765; total, 9,370. To same date last season: Oranges, 7,096; lemons, 2,164; total, 9,260. From Central California this season: Oranges, 3,455; lemons, 226; total, 3,681. To same date last season: Oranges, 2,228; lemons, 233; total, 2,461. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

AT THE AUCTIONS

February 18

New York: 21 or., 5 lem. Nav. 4.15-7.50. lem. 5.35-6.10.
Boston: 3 cars lemons: 7.30-10.50.
Pittsburgh: 2 or., 1 lem. Nav. 4.30-5.75. lem. 5.15-6.25.
St. Louis: 4 or., 1 lem. Nav. 4.65-6.10. lem. 3.85.

February 19

New York: 11 or., 2 lem. Nav. 3.70-6.70. Bloods, halves 2.10-2.35, Mikes, halves 2.05-2.35, lem. 5.55-6.20.
Philadelphia: 2 cars lemons, 4.35-5.65.
Boston: No receipts California fruit today.

February 20

New York: 12 or., 8 lem. Nav. 4.25-7.10. lem. 5.10-6.10.
Boston: 2 Nav. 3.45-7.60.

Pittsburgh: 4 or., 3 lem. Nav. 4.15-6.40.

Alfalfa Is One of Imperial Valley's Great Crops

lem. 4.55-6.10.
St. Louis: 3 or., 1 lem. Nav. 6.00-6.80, lem. 5.00-5.50.
Philadelphia: 2 lem. 3.95-6.30.
Cleveland: 2 or., 1 lem. Nav. 4.95-7.00, lem. 4.25-6.60.

MARKET NOTES

Cabbage has reached its lowest ebb on the shipping market, selling down to $35 a ton in car lots and about $45 in mixed cars. It is doubtful if prices will go lower. Cauliflower is practically over, but a few cars remaining with prices firm at $1.35 to $1.50 a crate. More than 1,500 cars have been shipped from Southern California to date. Celery prices have dropped, selling at 85 cents in car lots up to $1 in mixed cars. Lettuce is picking up, running about $1.75 f. o. b. Imperial Valley points. Movement has been light during the early part of week on account of rain but is now turning toward normal. To date 1,100 cars have gone east, about two-thirds of present crop.

In the Los Angeles market there has been a heavy slump in Mexican tomatoes. Local wholesalers bought at $2.50 a crate and have sold at $1.75 to $2.25. Potatoes are back to early January prices of $5 to $6. Cabbage is down a dollar a crate from last week's prices. Peas are down to eight or nine cents, with heavy arrivals. Florida bell peppers are up to 35-40 cents a pound, an advance of five cents. First lot of asparagus is in and the first day was snapped up at 90 cents but is now down to 75 cents. A heavy lot of French endive is on the market, with a limited supply of mushrooms and strawberries but all three are taken by strictly hotel trade. Citrus fruits are in good demand with Navels up 25-50 cents a box, being quoted at $5.00-$5.25. Pomelos bring $4.00 for the best and lemons stand at $5.00-$5.50 for best San Fernandos, an advance 50 cents to $1 a box.

FIFTY THOUSAND FARMERS OWN TRUCKS

At least 50,000 farmers in the United States own motor trucks which they use on their farms. The figures were secured from approximately 35,000 selected crop reporters of the bureau of crop estimates, who were asked to report names and addresses of farmers they knew who own motor trucks for farm use. Pleasure cars and trailers for use with pleasure cars were excluded, and the reporters were asked not to take account of trucks which are used primarily for general custom hauling, or on regularly established routes. It is believed that in no state were less than 75 per cent of the trucks reported. If not complete in every respect the figures show the relative distribution very satisfactorily.

The exact number of motor trucks reported is 49,195, divided among the states as follows: Alabama, 847; Arizona, 95; Arkansas, 721; California, 1,019; Colorado, 804; Connecticut, 357; Delaware, 100; Florida, 380; Georgia, 1,808; Idaho, 329; Illinois, 2,261; Indiana, 1,548; Iowa, 2,773; Kansas, 1,732; Kentucky, 818; Louisiana, 310; Maine, 435; Maryland, 596; Massachusetts, 661; Michigan, 1,636; Minnesota, 1,255; Mississippi, 957; Missouri, 2,065; Montana, 359; Nebraska, 2,739; Nevada, 41; New Hampshire, 283; New Jersey, 862; New Mexico, 104; New York, 3,171; North Carolina, 1,450; North Dakota, 501; Ohio, 2,261; Oklahoma, 723; Oregon, 369; Pennsylvania, 2,760; Rhode Island, 152; South Carolina, 1,190; South Dakota, 1,708; Tennessee, 978; Texas, 1,668; Utah, 173; Vermont, 282; Virginia, 1,128; Washington, 682; West Virginia, 465; Wisconsin, 1,465; Wyoming, 174.

BEET SEED

The beet seed question promises to be a most interesting one for the coming two years. Strange reports have come from Europe about "big supplies" of seed, alleged to be on hand here and there and everywhere, but when representativs of seed importing houses in New York traveled across the Atlantic to hunt up these elusive seed supplies, they were found to exist solely in the imagination of would-be dealers in seed. Our Berlin letter gives some prices for beet seed that make strange reading. A pound of the best seed for use in Germany, purchased at retail from a dealer, cost 2.30 Mk. a pound—and as the mark is valued at a little over one cent today, the pound of beet seed might be bought by speculators in Germany for about three cents a pound—and might then be smuggled out of the country.

The small amounts which could be obtained in this manner constitute the sole amount of seed available in Germany. Seed from Czechoslovakia unfortunately has not a high repute at this time, several reputable dealers in New York declining to import it. Russian seed has been shipped in large quantities to Vladivostock — first for shipment to the United States — but the Japanese discovered the valuable seed and promptly purchased every pound of it—at the high rate of one yen a pound (50 cents). In the meantime, American beet sugar companies are straining every nerve to produce their own seed for 1921 seeding, as the spring of next year will be the critical period in this business.

Dutch and Danish seed is appearing on the market again in small quantities, but the demand for good seed is far greater at this time than the visible supply.—Sugar.

THE OUNCE OF PREVENTION APPLIED

Cotton planters, already fighting the boll weevil all the way from New Mexico to the Atlantic Ocean and threatened by the pink bollworm which occasionally gets across the Rio Grande, are not to have any more alien enemies on their hands if the United States department of agriculture can prevent it. Importers recently have insisted upon bringing in a considerable quantity of cotton seed from Porto Rico. The seed may be free from disease, or it may not be. Nobody has very accurate or thorough knowledge of infesting insects and pests of cotton in Porto Rico. So, before admitting the Porto Rican cotton seed, the department of agriculture is going to make a thorough investigation of the subject. A specialist has been commissioned to go to Porto Rico and make a study of cotton insects on the island. His report will enable the department to be certain whether or not cotton seed from Porto Rico is in any way a menace to the cotton interests of the United States.

PREPARE NOW FOR ARBOR DAY

Plant a tree. Begin now to line county highways and city streets with appropriate trees that can be unveiled and dedicated with ceremonies on Arbor Day, March 7.

This is the advice of State Forester G. M. Homans who is cooperating with civic improvement clubs and other organizations seeking to secure the planting of the greatest number of trees this year.

What better memorial to our dead heroes than a flourishing tree? Then too, there is the agitation throughout the nation for tree lined highways. California is noted for its good roads and should be foremost in lining its roads with snade trees.

Arbor Day should also emphasize the relationship of forested areas to the general prosperity. Arbor Day ceremonies should embody the words of the great American, Roosevelt, who said:

"A people without children would face a hopeless future; a country without trees is almost as helpless; forests which are so used that they cannot renew themselves will soon vanish, and with them all their benefits. A true forest is not only a storehouse full of wood, but, as it were, a factory of wood, and at the same time a reservoir of water. When you help to preserve our forests or plant new ones you are acting the part of good citizenship."

BRAN MUFFINS

Roger W. Babson of the department of labor said at a dinner in Washington:

"Speaking of labor, it has been a tough job to eat some of the health foods that were turned out during the war.

"A young lady said to a young man at a Washington dance:

"'Are you the same young man who ate so many of my bran muffins at the Red Cross last fall?'

"'No,' he answered, 'and, what's more, the doctor says I never will be.'"

HAND STIRRUPS

"See any fancy ridin' while you was east?" asked Three-Finger Sam.

"I sure did," answered Cactus Joe. "But everything's topsyturvy. People in the cars have to hang on with their wrists in straps."

"Jes' think of that. Usin' the stirrups for their hands instead of their feet!"—Washington Star.

SHE WAS CAREFUL

Miss Emily looked into a room in the settlement house, where a small girl was pounding the piano to her heart's content. "You may play on, Mary, if you are sure that your hands are clean."

"Oh, I'm bein' careful, Miss Emily," was the quick response; "I'm only usin' the black keys."

JUST IN TIME

"Ye-es," hesitated the bridegroom, "these cakes are pretty good, but don't you think there ought to be just a little more——"

"Your mother made them," interrupted the bride quickly.

"——of them?" ended he.

EVER MEET HER?

Dinks — Is Miss Gabbs a rapid talker?

Winks—Well, she fills in the time pretty well. The other day I rode with her for five blocks on a trolley car and she gave me the unabridged family history of seven of her neighbors.

THE MODERN RUBE

"Say, Cy, I jest found out what a rube is."

"Thet so, Hiram? What is it?"

"Why, it's one o' them 41 hour, $95 a w ek labor guys that thinks a farmer is goin' to sell him food cheap."—New York World.

SHE NEEDED HELP

Elizabeth was going to bed and when she had carefully and devoutly said her prayers, her mother heard her add, with considerable feeling:

"And, Oh! PLEASE Lord, make Newark the capital of New Jersey."

"Why, Elizabeth?" exclaimed her mother, "what made you say that, dear?"

"'Cause I wrote it that way in the examination today," earnestly replied Elizabeth.

LACTEIN

CONDENSED

Buttermilk

THE food and tonic from the first "peep"

—When you hear the first "peep peep" of the chick—then you want to start feeding the feed that builds strong, healthy chicks and matures them to heavy producers of eggs.

LACTEIN Condensed BUTTERMILK is the scientifically compounded food that supplies the chick with the proper nourishment and lactic fluid to combat successfully the fatal diseases of chicks.

LACTEIN Condensed BUTTERMILK is most economical to feed as there is no waste and the chicks like it.

Go to your dealer NOW—and get LACTEIN Condensed BUTTERMILK — give your chicks the food that returns you the greatest profit.

Unsigned communications receive no attention.

Udder Trouble

I have a cow that has had trouble with her two front teats. Some weeks before time for calving the two front teats filled up with milk. Believing it was too soon as the other part of the udder did not fill I milked them out and now they have about dried up and give scarcely any milk. She has had two calves. What caused those two teats to fill before the others and do you think she will ever give milk again as she should?—Subscriber, Berendo.

Your question is not very clear. You did not state whether she had come fresh yet or not. If she is not fresh yet she may give her regular amount of milk when she is fresh. Why the two teats filled up can not be told. You may find the reason when she comes fresh.

Cows Not Breeding

I have three heifers 22 months old and two cows each four years old that fail to get with calf. The cows have each had two calves. I have had all of them to the bull six times and in the meantime have skipped some periods and changed bulls but still they fail to get with calf. They are fed alfalfa hay and oat hay all they can eat and they are in good condition. Please advise me what to do.—Subscriber, Merced.

It is a little strange that all fail. The best advice we can give is to get a young bull and let him run with the herd. About once a week take the herd out and drive them five or six miles and back. This will warm up the blood and they will come in heat right. Also reduce the feed and give plenty of salt.

CROP ROTATION FOR BEET GROWERS

Some beet growers have robbed the soil for long years, having good financial returns, putting back not a cent in fertilizing values, and then raise the cry that beets are no longer profitable. Occasionally, on the best of beet soil, this depletion has gone on for 20 years, without a change of crops or a rest of the soil. A few miles below Compton, Los Angeles County, the writer found several ranchers who have cropped continuously with beets for 16 years and have had no failures. One stated his returns had been good for that number of years and then the wire worms took his crop.

So that winter he grew a crop of cauliflower, following this in the spring with beans. The next year beets were again planted and the yield was 26 tons to the acre, enough to cheer the heart of the most pessimistic. This land, however, is of the best. But these operations plainly show what is necessary—rotation of crops. On the ranch adjoining the one just mentioned alfalfa planted in November produced five cuttings the first year, seven cuttings, running ten tons per acre for the season of the second year and was then turned under and planted to beets. The crop was enormous and of high sugar content. At the present high price of hay one may rotate barley in the scheme and get better financial returns for one or two seasons than beets would bring. But alfalfa is the crop needed for restoration of fertility for the beet crop. Of the several growers interviewed nearly all favored but a two year run of alfalfa, the minority advocating three years. All were optimistic regarding the future of the industry. Those men of longest experience in the Compton field, when asked if they expected to continue growing beets, answered decidedly in the affirmative, stating that instead of draining the land continuously with sugar beets, as in the past they would in the future run in an occasional two year change to alfalfa, or as often as shall be proven to bring best results. The past season, being very dry, all have irrigated their land by flood checks and are now ready for planting. Beet acreage in that section will not decrease except as interfered with by the necessary rotation with alfalfa. —E. B.

DOCTOR WOODPECKER

Just as plagues and epidemics wiped out whole villages of people in the Middle Ages, so if left to their enemies it would be only a few decades before all forests would be murdered—nothing but dead, grub bored stubs and fallen trunks left. To prevent this terrible condition nature sends a physician regularly to each patient. Sometimes Doctor Woodpecker has been known to spend as many as three days operating on one very bad case, constantly using to advantage his tree surgery tools. Generally his incision is only as deep as the thickness of the bark. Often he slides his spearbill between seams or crevices and draws out the worm, leaving no mark or scar on the bark to show where he did it. At other times his cuttings may be deep galleries, tunnels, or caverns.

A great deal of the drumming that we hear is only for sounding purposes—much like a man taps the wall with a hammer to find a studding. When Doctor Woodpecker has discovered a diseased part he directs a rapid fire of rattling beats upon the spot with his pickax bill, raining his hammerlike blows with automatic and astonishing precision, until his prey is brought to light. Then he thrusts in his barbed bill and, with a sudden backward jerk, brings forth the deadly grub.—Kansas Industrialist.

ARTIFICIAL LIGHTING FOR EGG PRODUCTION

The practice of lighting the hen house by artificial lights is something that is no longer a novelty. Many farmers are using lights. Commercial poultrymen have realized their value and have installed them. It is an established fact that electric lights have a definite influence on the normal production of the laying stock, says G. W. Hervey of the University of Missouri college of agriculture. This effect on egg production does not necessarily mean an increased egg yield for the year but it does mean an increased number of eggs during the winter season when the supply is low and prices are high. In Missouri, yearling hens yield about 15 per cent production from November 1 to January 20 under the right kind of management. Then the production suddenly jumps and continues to rise until the middle of April and remains at a maximum level of between 50 and 60 per cent until the second week in May when it begins gradually to decline. The problem, then, is to get the hens to shell out eggs during November, December and early January. It is simply advancing normal production two months and a half.

Many different systems of using the lights are being used. Some poultrymen turn on the lights at sundown and shut them off again at nine o'clock. Others use the light from three or four o'clock in the morning until dawn. Sometimes this artificial illumination is given both morning and night. The birds on the poultry farm of the University of Missouri are given artificial light two and one-half hours before dawn each day. Just as soon as the lights are turned on the attendant goes through the pens and fills the water pails. It has been found that the hens as soon as they jump from the perches invariably go to the drinking pails for water and if it is not then supplied they are not active. It is a good plan to throw a few handfuls of scratch feed into the litter when the pails are filled to get the birds to scratching. Artificial lighting is of no value unless the birds are made to exercise during the increased light period. Attempts to increase the working day by turning on the lights at night have not as yet met with any measure of success at the University of Missouri. It is found that after the hens are given the regular afternoon scratch ration they go on the perches whether the lights are turned on or not. At present night lighting is not recommended.

CONCERNING THE LOQUAT

(Continued from Page 327.)

and the quince, the former being by far the most generally used in this state. Either budding or grafting may be resorted to, preference being given to the former method of propagation which is the easier of the two and the most generally satisfactory. Trees budded on loquat stock are frequently very precocious and should not be allowed to carry fruit for the first two or three years, which should be devoted to the formation of a strong framework upon which future crops are to be produced. The ordinary shield bud such as is used in citrus is quite satisfactory, the custom being to insert the buds in year old seedlings in the fall, the bud being forced out by cutting back in early spring. Trees are usually balled for setting out, which generally gives more satisfactory results than setting out with bare roots.

Orchard Management

The care of a loquat orchard or grove differs little from that given to citrus trees or other orchard fruits. Customary distances for planting are about 20 feet on the square system, although, as mentioned previously, it is a custom in certain sections to plant the trees in solid rows about 20 feet apart, the trees from ten to 12 feet apart in the row. Interplanting loquats with other fruit trees is fairly common, the loquat coming into bearing early and serving as a profitable interset before the permanent trees reach full bearing.

Since the harvesting season is the opposite of that of many of our fruits, either clean cultivation during the winter and spring or sod culture is preferable to growing a winter cover crop. Summer cover crops should thus obviously prove better for soil building on account of the necessity of allowing the winter cover crop to mature during the harvesting season.

Fertilization has been practiced but little as yet, but undoubtedly will prove profitable. Irrigation should be given in approximately equal amounts as with citrus in order to insure sizable fruits of good quality. Pruning is practiced but little, the tendency being to keep the tree close to the ground and reasonably open and free from dead wood.

Thinning out of the clusters is a practice which should be used more generally on account of the tendency to heavy bearing. This is usually accomplished by merely clipping out the ends of the bunches of clusters with a pair of shears, it being obviously impossible to thin the fruits in an individual cluster.

Bagging both to protect the fruits from bird pecking and to improve the quality is not used to any considerable extent but will undoubtedly pay, especially with the earlier and more choice varieties for fancy trade.

Harvesting

Fruits should be left on the tree until fully matured when the entire cluster should be cut with a sharp pair of clippers. The fruit is then graded into two grades usually, fancy and seconds. No standard package is used for shipping as yet, although good returns are being obtained with special baskets and cartons.

Varieties

The number of good varieties as yet is comparatively small, Amongst the best are Advance, Champagne, Early Red and Premier. Other desirable varieties to be found include the Thales which many believe to be identical with the Tanaka, a variety introduced from Japan by the department of agriculture in 1902, and some hybrids of Algerian origin introduced by the department some years later.

Of these varieties, the Early Red is undoubtedly the earliest, frequently ripening in February. For later varieties the Champagne, Advance, Premier and Thales are apparently the best, preference being given by some growers to the Champagne, and by others to the Thales.

Uses

The fruit is largely eaten fresh out of hand, but makes most excellent jellies, jams, preserves, pies and it also cans well.

Pests

The tree is remarkably free from diseases and pests. The most serious of the former are pear blight, which sometimes attacks the tree rather severely, and scab, which spots the fruit and leaves.

Birds are probably the worst pest, although where grown in large quantities injury from this source is relatively unimportant.

GO FOR THE GOPHER

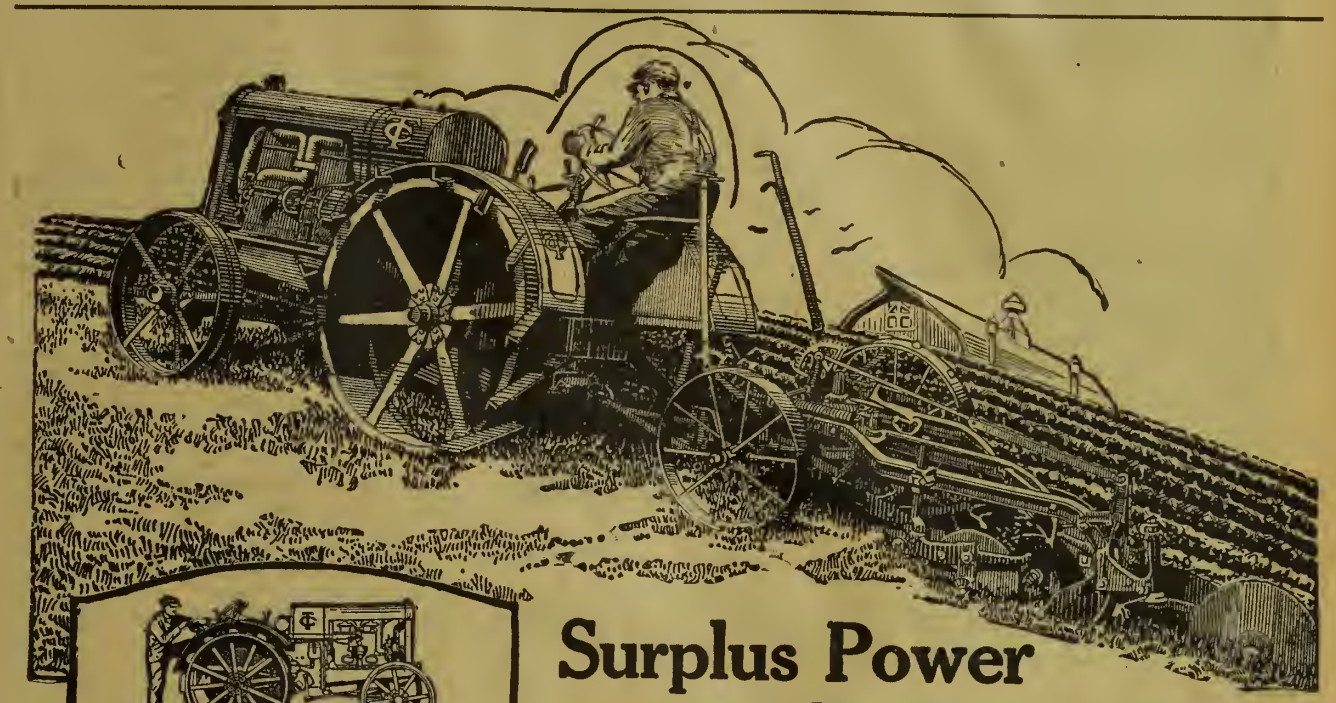
(Continued from Page 327.)

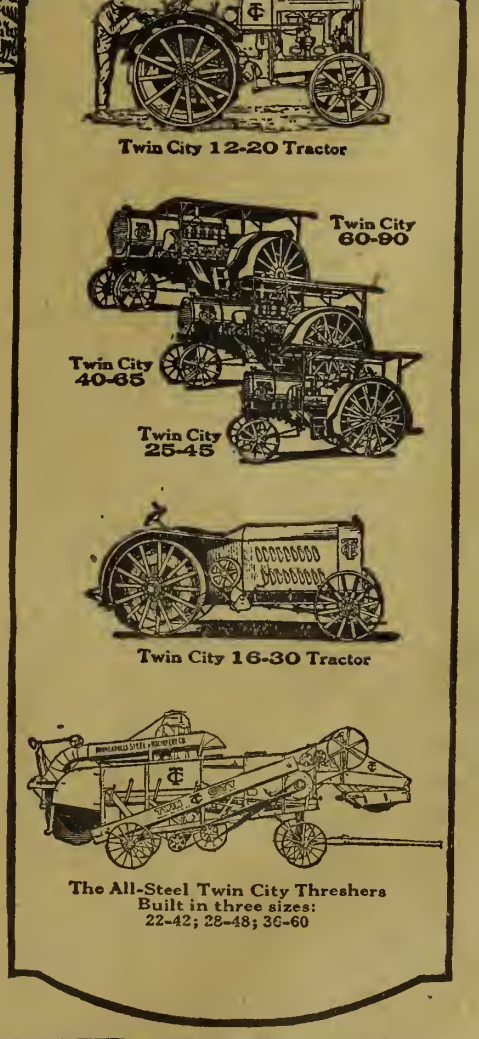
otes, skunks and weasels are all natural enemies, some of which we should at present protect. Rattlesnakes are very effective exterminators yet they in turn must be exterminated.

"If traps are set in laterals, open out and put trap in full length. Close opening with bunch of grass so a little light will enter. The gopher leaves much of his system open, some he closes. If he comes along tunnel and sees a faint light he knows he did not leave it so and goes to investigate and so runs into the trap. If you leave hole open or closed he may take it for granted all is normal and pass on. If it is fully open and he wishes to close it, he pushes a lot of soil ahead of him for the purpose and so pushes the trap out of the ground or plugs it with soil. In trapping disturb his work as little as possible.

Involuntary Suicide

"The poisoning of gophers, like trapping, is attended with some cost, but is usually more economical than trapping. Vegetables and fruits are used for bait, of which sweet potatoes, carrots and parsnips are best, though white potatoes, apples, oats, barley and even raisins are used. Of all named sweet potatoes keep the longest in edible condition beneath the soil, for we find the pieces good in ten days. We find an advantage in large pieces over small pieces or grains, for if small enough to put in his pouches he may carry and store, but if too large he eats part or all at once. So cut your bait in pieces about a half inch square and an inch long. Put it in a colander or other vessel merely to dampen it so poison will stick. Then with a common pepper or spice box shake over bait a small quantity of a poison made with one-eighth ounce of strychnine and one-thirty-second of an ounce of saccharine. This quantity is enough for four quarts of bait. Your county horticultural commission will sell you a little square pepper can, containing enough poison for four quarts of bait, for 30 cents, which is cost. The gopher likes a variety of food so if he is working in a potato field use carrots or parsnips and "switch" the kind of food occasionally. To find the runs we use a prod made from pipe with solid points welded in. Use the small end to find the run, which is easily told when you strike it, and then the larger end to make the opening large enough to admit a piece of bait. Treat each system of runs in about three places. Don't drop soil on top of bait; partially close hole with a lump of soil or bunch of leaves or grass. This prod has a total length of four and a half feet. The arm is for the hand or foot in forcing prod into hard soil."





Surplus Power means Surplus Profits

When you want to plow deeper in tough soil or have a heavy run of threshing ahead, you need sure power and lots of it. The Twin City gives it to you and has the strength to back it up.

When you plow hilly or specially bad lands, or when your men load up the thresher, then the Twin City shows its true worth. It keeps steadily on, eliminating costly delays and expensive repairs.

Because it is ***built to do the work, not to meet a price.***

Twin City 12-20 is the outstanding tractor of the year for power, endurance, economy and all-round dependability.

Its sixteen-valve (valve-in-head) engine insures quick cylinder clearance and quick introduction of new fuel. Burns kerosene perfectly, and developed in our own great plant by our own engineers Counterbalanced crankshaft—removable cylinder head and cylinder sleeves. Gears drop forged, steel cut and case hardened, run in oil bath in one-piece, dust-proof case. Hyatt roller bearings. The simplest, most dependable tractor for your farm.

We have a widespread organization of service branches, distributors and dealers. Write and we will direct you to nearest Twin City dealer.

SMOKE YOUR MEAT THE "WRIGHT" WAY

Hickory Cured Hams are Best

THAT'S why we use Seasoned Hickory Wood in making WRIGHT'S CONDENSED SMOKE. If you want some good old fashioned Hickory Flavored Hams and Bacon use WRIGHT'S HAM PICKLE and WRIGHT'S CONDENSED SMOKE. The Ham Pickle is a scientifically prepared sugar cure. A dollar jar and 27 pounds of salt prepares a barrel of meat for smoking. A Dollar bottle of WRIGHT'S SMOKE, thirty minutes and a small brush will thoroughly smoke your meat and give it a Delicious Flavor. The "WRIGHT" Way of curing meat is easier, quicker, cheaper and gives better results. No fooling with fires. No danger of meat spoiling. No drying out or shrinkage.

WRIGHT'S FARM BUTCHERING SET (Nine regular butchers' tools, including saw and cleaver) should be on every farm. We buy in carload lots and resell at cost—$3.95.

Send for instructive booklet: "*The New Way of Smoking Meat.*"

All Wright's Products Are Guaranteed. Sold By All Drug and General Stores.

A POMONA ORCHARD POULTRY FARM

(Continued from Page 329.)

to prevent dust dropping through the crack upon the eggs. "Get rid of the crack," was the obvious prescription for this trouble, and so the cover is set back a little from the edge of the nest. Now when it is lifted the dust falls on the board beneath and not on the eggs.

Instead of the tightly closed eaves behind the droppings board, which were characteristic of the original Weeks house, and the expensive wooden lining behind and over the droppings board which is used in the university farm houses, Mr. Ross uses a piece of plaster board perhaps three feet square, which covers the opening and at the same time permits the air to enter. With the circulation of air thus produced he finds the window under the droppings board, usually considered necessary, is not required but is rather a nuisance than otherwise. His houses have therefore no such windows, and he has never lost a hen in our hottest spell in any of these houses.

The fact that the nest boxes are movable has led to another successful scheme for breaking up "clucks." When the hens begin to go broody in the spring they are taken from the nests immediately and put into one of the pens by themselves. The nest boxes are turned so that no hen can enter them. They find feed and all their environment exactly as usual, but no nests, and so go to eating and forget their desire to incubate. Mr. Ross believes that hens treated in this way return to laying considerably sooner than hens confined in slatted coops.

Raising the Chicks

No males are kept on the Ross ranch and no hatching is done. It is a commercial egg ranch exclusively. Day old chicks are bought from a breeder who makes a specialty of trapnested stock and come to the ranch in two lots of 1,300 chicks each, ten days apart. This year they arrived February 18 and 28. The raising of these chicks is Mrs. Ross' job, and she has worked out a system which brings nearly every one to broiler size. The chicks are kept quiet in their wire pen around the big brooder stove for from one to two days after they arrive. Buttermilk is before them in fountains, and grit, no water. They have been out of the shell from 50 to 60 hours before they receive their first meal, which consists of scratch grain only. For five days they get nothing but this chick scratch, which consists of 35 per cent cracked wheat, 25 per cent cracked corn, 30 per cent cracked milo and 10 per cent whole oat groats.

After five days the following mash is set before them: 35 per cent wheat bran, 10 per cent low grade flour, 22½ per cent corn meal, 10 per cent ground oat groats or rolled breakfast oats, 10 per cent ground milo, 7½ per cent Croley's high protein meat, 5 per cent fine bone. To 100 pounds of this mash is added 2½ pounds charcoal and ½ pound salt.

After 30 days on the chick mash, the chicks are given the growing mash, which contains 50 per cent wheat bran, 10 per cent low grade flour, 15 per cent corn meal, 10 per cent ground milo, 5 per cent oat groats (ground) or oat flakes, 5 per cent Croley's meat, 5 per cent ground bone, and the same amount of charcoal and salt as before. As soon as the chicks will eat whole grain the wheat, corn and milo which make up their scratch feed are given without cracking. As a little whole grain is mixed in almost from the first it is not long till the chicks are off the chick scratch and on the regular scratch of whole grain.

A Novel Weaning Coop

To save unnecessary labor and expense is the rule of the ranch, and the simple way in which chicks are weaned from the brooder and accustomed to the laying house is but one illustration. When the chicks are three weeks old 100 of the strongest are picked out and taken to one of the sections of the laying house. Here they are put to bed on the droppings board under a canvas hover 3 feet by 8 by 1 foot. A runway is built from the droppings board to the floor, and there you have an improvised cold brooder where the chicks soon get used to the cooler air and which they do not leave till they are ready for the laying house. To teach them to go up the runway to bed Mrs. Ross uses two toy brooms, and they quickly learn that the appearance of the brooms means bedtime.

Mr. Ross believes that most of the chicks which fail to grow to maturity are injured by either overheating, overfeeding or overcrowding. The first few days in the brooder house they need to be kept very warm; 95 degrees is none too high a temperature for the first day, but as they grow they should be accustomed to cooler air, and after three weeks the heat of their own bodies is sufficient. Pullets brooded in this way last year laid their first egg before they were five months old.

Conditioning Pullets

Instead of putting pullets on a maintenance mash to postpone laying and prevent the fall molt, Mr. Ross plans this year to put them on a ration containing less meat but more carbohydrates for from four to six weeks before the pre-maturity molt, then switch onto the full laying mash. His theory, which follows the conclusions of Professor Rice and other experts, is that a hen in order to be a prolific layer must have some surplus fat on her bones. A Leghorn that has once commenced to lay never puts on surplus fat and is very easily thrown into a molt by change of feed or unusual weather conditions. If she is to be kept from molting it will be only by full feeding. To quote the words of a thoughtful poultryman: "The feather lives in the skin. If there is no fat, the feathers die and fall out."

The laying mash, which is given as soon as the pullets begin to drop their feathers in the pre-maturity molt, consists of 35 per cent wheat bran, 15 per cent low grade flour, 20 per cent corn meal, 20 per cent ground milo, 2½ per cent coco or soy bean meal, 2½ per cent Croley's meat, 5 per cent bone; salt and charcoal.

Mr. Ross is first vice president of the Poultry Producers of Southern California and a leading member of the Pomona Valley Association, and much of his time is given to disinterested work for the betterment of the poultry industry. Not a few young men who are making a start with poultry and women who have turned to this work for a living for their families in time of need owe their success in large part to his kindly interest and advice. A day with him is equal to a week's lectures on poultry husbandry.

Poultry Queries

Conducted by J. A. Koethen

Floor Space Per Hen

How much room should be allowed 50 hens when kept penned all the time?—Subscriber, Hemet.

From three to four square feet of floor space per hen is allowed by most poultrymen, and four is better than three. A house 14 feet square is good size for 50 hens, or if you prefer a long house, make it ten by 20.

Scratch Grain

Is it necessary to feed grain twice a day? The hens have Surelay before them all the time, with either wheat, barley or milo fed at nights.—Subscriber, Hemet.

The scratch grain is usually fed at night only, but enough is fed so that a little is left over in the litter for morning.

Literature on Pheasants

Where can I secure literature on care of pheasants and game in general?—Inquirer, La Grande.

Farmers' Bulletin No. 390 of the United States department of agriculture on "Pheasant Raising in the United States" may be had from Government Printing Office, Washington, D. C., for five cents. There is also a very comprehensive volume on "American Pheasant Breeding and Shooting" by E. A. Quarles of the American Game Protective Association, published by the Hercules Powder Company, Wilmington, Delaware. I do not know its price, but it goes very fully into

all details of hatching, feeding, treatment of disease, etc., and would seem to be exactly what is desired.

Chicks With Rheumatism

I brooded 1,500 chickens, receiving them on November 29. All seemed to go well with them for about three weeks, when they developed what appeared to be rheumatism. Whatever it is, 500 completely lost the use of their legs. They appeared to be healthy and strong otherwise and apparently died because of being trampled on by the others, being helpless to get out of the way and care for themselves. No remedy tried helped them. Can you give any information on this matter? — Subscriber, Petaluma.

When brooder chicks die or develop any disease we ask first of all what the symptoms were and, second, what conditions in the environment might possibly have been wrong. These chicks may have had rheumatism. In that case there should have been apparent some stiffness or the twisting of the toes. If no such symptoms were noticed I should sooner think the chicks' legs were weak from lack of exercise. A chick doubles its weight the first three weeks. If it is in a crowded brooder with no chance to use its legs save in a limited area, and is heavily fed, the result is very likely to be over development of the body and under development of the legs. The remedy, of course, is prevention. Give your next lot of chicks more room to run and encourage them to exercise when they are confined in the brooder by throwing in something for them to play with. A few nice juicy earthworms thrown in the brooder every day after the chicks are a week old will give them a lot of exercise. If the trouble was rheumatism, it was caused without question by dampness, and here again the only remedy is prevention. After chicks are ten days old it will not hurt them to run on damp ground if they have a dry, warm place to go when they feel chilly, but the ground must always we well drained and their brooder perfectly dry. Chicks under three weeks of age must be carefully watched to make sure that they know where to go when they are cold. Sometimes they are very stupid about learning.

FINE PROGRAM FOR POMONA

The Pomona Valley Poultry Breeders Association has prepared a very attractive program for its year's work. Meetings are held the first Wednesday evening of each month.

On January 7 was held election of officers and there was discussion on moulting of early hatched pullets. On February 4 report was made on results of demonstration farm investigations in 1919 by University of California, and the brooding of baby chicks was considered. The following is the program for coming meetings:

March 3: Brooding and care of growing stock. Growing rations. Culling and grading. Weaning methods. Teaching to perch. Parasites and diseases.

April 7: Subject to be announced later.

May 5: Feeding for high egg production. Balanced ration explained. Variety, palatability, availability. How you feed as important as what you feed. Dry vs. wet mash. Litter and trough feeding of scratch. Feeding for molt.

June 7: Annual picnic. Demonstration.

July 7: Outdoor meeting. Culling demonstration.

August 4: Poultry housing. Size of units. Yards vs. no yards. Common types of houses. Economy, convenience, drainage, ventilation and sunlight.

September 1: Making a success of poultry keeping. Starting correctly. Pure breds vs. mongrels. Ways of securing stock. Size of plant necessary to secure satisfactory income.

October 6: Breeding for higher egg production. Trapnests and their use. Selection of breeders without trapnests. Line breeding. Grading up.

November 3: Timely topice. Electric lights. Cooperative buying and selling. Systems of records and accounts. Books, periodicals, state and federal literature.

December 1: Appurtenances of the poultry ranch. Convenience, simplicity, labor saving.—J. A. K.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

Santa Cruz report for week ending February 14:

Pens to date having laid over 50 per cent: Walls, 540 eggs; Neef, 476; Rose, 471; Enterprize Poultry Ranch, 456.

Individuals averaging 70 per cent and over to date: Walls, 80; Walls, 68; Hollis Peck, 68; Barker, 68; Gibson, 65; Bellow Bros., 64; Webb, 64; Hale, 64; Neef, 64.

High pens for week, 60 per cent and over: Rose, 50; Bellow Bros., 50; Enterprize Poultry Ranch, 49; Amsbaugh, 49; Hollis Peck, 46; Walls, 46; Wilson, 43; Neef, 42; Lehman, 42; Wood, 42.

AMERICAN EGG LAYING CONTEST

Leavenworth, Kansas, report for January, 1920: While no startling records were made in January, the pullets made a good average for the month and no pens made an extremely low record. A S. C. Red pullet from New York led the month's individual records with 30 eggs to her credit. The ten highest pens for January were: White Wyandottes, Pennsylvania, 113 eggs; S. C. Reds, Nebraska, 112; White Leghorns, Washington, 112; S. C. Reds, New York, 109; White Leghorns, Pennsylvania, 106; White Orpingtons, Ohio, 105; White Orpingtons, Wisconsin, 104; White Orpingtons, Ohio, 103; R. I. Whites, Kentucky, 100; Barred Plymouth Rocks, Kansas, 99.

Three pens have made a record of over 100 eggs per month which is over 20 eggs per pullet for the three winter months.

GET MORE EGGS.

"Lady Victory"
1918 Champion laid 304 eggs in 365 days. Highest official record of any living hen. She laid 25 eggs in Jan., 27 in Feb., 29 in March.

Milkoline will help make your hens lay more eggs.

Feeding Milkoline will make you more money —reduce mortality of your flock— keep flock healthy and less liable to disease.

Increase Poultry Profits Any poultry raiser can easily double his profits by doubling his egg production. Feeding Milkoline with other feed greatly assists assimilation, keeps digestive organs vigorous and is a wonderful appetizer, tonic and bowel regulator. Milkoline contains nutritive elements vital to egg production and not found in grain rations.

13,000 More Eggs
Jas. E. Keyes, Petaluma, Calif., says: "After feeding Milkoline for eighteen months to 2,500 hens, I find that worms cannot exist in poultry where Milkoline is used. I reduced mortality with laying hens 10 per cent. I increased the egg production of my flock thirteen thousand eggs in one year. Feeding Milkoline to laying hens keeps them in splendid health thereby preventing disease and derangements of all kinds."

Lowers Feeding Cost
Many feeders say Milkoline lowers feeding cost one-third, because their hens assimilate all feed they eat. Our liberal Guaranteed 30 Day Trial Offer enables you to try Milkoline at our risk—to prove that it will make you mighty good money.

Milkoline
has a base of modified buttermilk with essential fats and acids added. Milkoline comes in condensed form. Will not mould, rot or sour. Keeps indefinitely in any climate. Milkoline is simply "Good Buttermilk Made Better for Feeding." Flies don't bother it.

Prevents Disease
Milkoline is not featured as a cure for anything or a preventative, but due to the acidity in the buttermilk it is a germ destroyer and helps keep poultry healthy, which is the best preventative against disease. Milkoline is invaluable as a life saver for baby chicks.

PRICES
These prices are F.O.B. Kansas City or the address of our nearest dealer. Dealers in all parts of the United States.
5 Gal. Keg - $7.50
10 Gal. Keg - 12.50
15 Gal. Keg - 16.50
32 Gal. Barrel 32.00
55 Gal. Barrel 49.50
Prices on smaller packages given in booklet. Buy in barrel lots—it saves you money.

Only 2c a Gallon
For feeding mix one part of Milkoline to 50 parts of water (small feeding 6 tablespoons to gallon of water). Feed either with water or mash feed. Milkoline keeps their appetite keen and its action is highly essential to normal egg production. When fed as directed Milkoline costs only 2c a gallon or less. Trauhaft & Newman, Lankershim, Calif., say: "We would not go back feeding straight buttermilk at any price."

Guaranteed Trial Offer
we will ship you 1 Gallon for $2.25, express prepaid. Take 30 days—feed half to your poultry. If entirely satisfied simply return unused portion and we will refund every cent you paid us. Milkoline has been producing so many amazing results and we are so certain of what it will do for you that if not for portion you have used. Milkoline is legally guaranteed to be satisfactory. You are always be judge. We suggest ordering larger quantity—you get the benefit of lower price—you risk nothing—you must be satisfied or we refund every cent you paid us. Make this test now. The sooner you begin using Milkoline the quicker you will be making money.

Commercial Value of Beauty

By Ernest Braunton

REAL estate sales where the value of the improvements is acknowledged to be equal to or greater than the land value are not now uncommon and every year appreciation of landscape beauty is more manifest. A case is called to mind where a buyer paid $5,000 more for his home because of the presence of two large Canary Island palms in the front lawn. The writer recently stood in front of a little bungalow under such a palm and heard an elderly well to do eastern business man exclaim: "If I come to California to live I would pay $500 or $1000 more for a place if it had a palm like that."

The courts also have recognized such values, for in case of destruction of trees the owners have been awarded in various states, running from a few dollars up to $2,000 dollars for a single tree in the state of Massachusetts. If not all who read these lines know of land transfers where trees and shrubs were recognized in the valuation, everyone can call to mind places he or she has seen that would have a heavy added value because of the presence of these, so we will assume all are willing to admit that landscape beauty is a valuable asset and lack of it a liability, so far as home making is concerned.

And the beauty of it! Through 30 years of professional handling and observation of plant life the writer has noted the luxuriant growth and beautiful color of the country trees when compared with those of the city. A short time ago we saw some giant cedars of such a clean grayish blue-green, so unusual, that they instantly suggested such color must be the one borne by the forests of these trees in the distant Himalayas. No such color or vigor or thickness of foliage is known in any city, for soot and dust and other influences of the cities bring all such vegetation to one level in color, a monotonous, smutty, partially obscured green.

Why then, is not landscape beauty of greater value in rural districts? Tall buildings suggest the presence of more building; natural landscapes, always more or less beautiful, suggest still more of such beauty where mankind has chosen a home site, and all observers are disappointed if it is lacking.

Granted that we desire and need trees to walk beneath during summer's heat and winter's wind and rain, shrubs to beautify and frame our own little garden, flowers to cull or admire as we will and beautiful stretches of lawn as the canvas upon which our home picture is spread, how shall we plan aright? Around stately dwellings we shall have stately plants in stately groups, but in the less pretentious and more lovable home grounds we must have simplicity as the keynote and with simplicity may always be found a satisfying dignity and sufficiency. But we cannot gain this by thoughtless or irresponsible planting. More than that, it cannot be gained without a well conceived plan. No one would plan or plant his home grounds as he would his orchard. For the latter he has certain rules that govern his every move, rules recognized as economic necessitles. In the decoration of the home grounds we enter the realm of art and will here propound the rules and principles that all successful landscape artists have followed who have built the world's masterpieces, whether surrounding castle or cottage.

Landscape Rules

The first admonition is that open lawn centers must be preserved. We must have a nice sweep, big or little, that is not cluttered up with plants of any sort, for the latter must frame the lawn and be grouped about the sides. Just how this lawn should be made will be told in a later issue for it is yet too early for spring lawn making. We must next plant in groups or masses and not with isolated specimens or straggling individuals. Plant all of one kind together, the way nature does. If we are to have a thicket of bridal wreath let it be one and not have one or more bushes in various parts of the garden. Have each part of the garden with a strength of character all its own. In one part it will be built with bridal wreath, in another something else, but always but one sort. We may have a group of palms, or of elms, but we will keep them together and not dispose them in orchard form.

To observe our third rule we will avoid straight lines. Occasionally they are admissable, even advisable, but nature makes none, nor can man without the aid of strings, straight edges and the like. The canopy above us, the horizon about us, are circles. The way of rivers and other streams, the lines of a horse, bird, the human form divine, all are graceful curves. As nature makes no roads or paths and no straight lines, let us have only such roads and paths as are necessary and curve them gently except they are so short that curves would appear ridiculous. All lines that parallel unchangeable straight lines must be straight also. This will apply to paths immediately surrounding the house. But approaches, if of length, should not be straight except the general plan is severe and formal. The fundamental idea should be to have all easy, comfortable and natural; not as though man had built it, but had assisted nature in making more beautiful what was.

With these thoughts in mind we cannot go far astray. We are seeking beauty and comfort so that the garden shall please and satisfy. And though this article is intended only as general, to be followed by one specific as to materials, let us urge that you make it doubly attractive through seats to rest upon, arbors for shade, a water pool for lilies and fish, perhaps a fountain, a rock garden or a fernery, and all the things dear to the normal human heart. Then in the choice of plant life cannot we combine beauty and utility?

All in California may have some evergreen fruit trees, even if but a group of two or three loquats; in more favored sections avocados, etc. Or if deciduous trees are found more desirable use walnuts, chestnuts, pecans, or others for shade, for none are more beautiful. Why need we lose sight of the economic side when decorating the home grounds? Let us have trees, shrubs and plants that will answer to a new word—"beautility," plants of double duty or dual purpose. Reminds us of Goldsmith's piece of furniture:

"It did a double duty pay,
A bed by night,
A chest of drawers by day."

PRODUCTION OF CALIFORNIA BEANS

E. E. Kaufman, field agent of the bureau of crop estimates, reports that the lima bean crop turned out much better than expected at the time the preliminary estimate was made on October 1. The final estimate is now placed at 1,350,000 bushels equivalent to 810,000 centals or 100-pound bags. The production of "beans other than limas" is estimated to be 3,650,000 bushels, making the total crop 5,000,000 bushels, equivalent to 3,000,000 bags.

Conditions at time of harvest were ideal, and the quality was of high medium grade, or 100 per cent compared to 85 per cent for the 1918 crop.

The average "pick" (trash, split and otherwise defective beans) was light, about four per cent compared to 10.5 per cent in 1918.

Following is the estimated production by varieties in centals or 100-pound bags, in 1919: Limas, 810,000; Baby limas, 192,000; Small Whites, 630,000; Large Whites, 390,000; Pinks, 600,000; Black Eyes, 180,000; Red Kidneys, 39,000; Cranberries, 63,000; Mexican Reds, 48,000; Bayos, 15,000; miscellaneous, 33,000. 1918 yield: Limas, 1,545,000; Baby Limas, 134,000; Small Whites, 978,000; Large Whites, 618,000; Pinks, 721,000 Black Eyes, 463,000; Red Kidneys, 26,000; Cranberries, 103,000; Mexican Reds, 154,000; Bayos, 118,000; Teparies, 257,000; miscellaneous, 33,000.

Household Department

GOOD-NATURED NATURE

Oh, the orchards are in blossom, an' the skies above are blue
An' the petals o' the peonies once more are wet with dew,
The whole world's at its finest, an' I'm leaning on the gate
Thinkin' just how glad we should be that the flowers never hate.

The woods don't carry grudges, an' the clover's never mean,
The poorest girl's as welcome to their blossoms as a queen;
An' the tramp along the highway has green velvet for his couch
For the glorious part o' nature is she never has a grouch.

The breakfast o' the tulips must agree with them each day
For they nod a smile o' greeting to the travelers on the way;
An' whether days are sunny or the world is dripping wet,
I've never seen the violets in a fit o' temper yet.

I'm drinkin' in the beauty, as I'm leanin' on the gate
An' thinkin' what a pity that we mortals learned to hate;
For the flowers are always smilin' an' the song birds sweetly call,
An' the works o' Mother Nature seem to like us, one an' all.—Edgar A. Guest.

THE STORY OF WILD RICE

By J. H. Hiesser in The Rice Journal

THE history of wild rice goes far back into the impenetrable past. It has long been the principal article of diet, not only for the myriad thousands of wild fowl, but for the red men of the north also. Around their campfires the following legend has been handed down from generation to generation, being told by the Indian braves to their children.

Away back, when the world was young, the Indian tribes lived in the bright and sunny south. According to the word of the Creator they multiplied and covered the face of the earth, as far as they then knew, except into the far north. They believed that from the north came cold and darkness and that whoever wandered beyond certain restricted lines from the sunny south would be taken by the Frost King and imprisoned in his icy home.

In time the Indian tribes became so numerous that game was in danger of extinction and, in order to maintain life, they made war one tribe upon the other. Most of the Indians became cannibals, killing and eating their prisoners, but there were a few who thought this way very wrong. The chief of their tribe was named Babomwagiwiskung. He did not believe in nor would he take part in any of their cannibalistic rites.

One day he had wandered far from his tribe in search of game, and becoming exhausted from fatigue and hunger laid down to sleep. He had a vision. He saw a beautiful White Spirit which told him to gather his followers together and wander into the northland, where peace and plenty awaited them. They were to have no fear of the Frost King, as the White Spirit would ever watch over and guard them. He was to take his tribe and travel at once towards the north to the time of the third full moon, when he would come to the banks of a great lake and in a cave, which would be marked, he would find a birch bark basket containing seed and he was to take that seed and cast it upon the waters and the seed would grow and produce a food that would be everlasting; that drouth, or floods, or frost would not destroy. This was to be given to him and his people as a reward for the good and manly spirit they had shown in not becoming cannibals, as had the other tribes of red men.

Upon awakening, he hastened to his lodge and gathered his tribe together, they turned towards the north and, as stated in the vision, found at the appointed time the lake, the cave and the seed and sowed it as directed by the White Spirit. It grew and flourished and they gathered it in and stored it for future use when the cold winters came upon them. They found this rice would maintain life, health and vigor and it proved also a great attraction for wild fowl, which came to them in countless numbers. The only condition the great White Spirit exacted was that they were always to live in peace and harmony with the white race, which was to come many years after. It told him that in time the white race of men would come across great seas and occupy their lands and inhabit their country, and, as long as they kept peace with the white men just so long would the Great White Spirit furnish them with Wild Rice.

This is why the Chippewas have never been at war with the whites, and they firmly believe that the food, which is the main sustenance of the Chippewa tribes, was given to them by the Great White Spirit, through their Chief Babomwagiwiskung.

The North American Indian has for centuries known the value of wild rice as a food and it is to this day the principal article of diet of the Indian tribes of northern Minnesota, Wisconsin and Canada, the natural home of the wild rice plant. Even though white men have introduced other grains which are harvested and prepared for food with less labor and expense, the Indians devote much time and energy each year to the gathering of the wild rice crop.

An Indian courier is often required to take long journeys and accomplish them quickly. His road may be through the trackless forests or over the far-reaching prairies. His errand demands haste and he has no opportunity to stop and search for food, but must take with him that which will not only strengthen and nourish him, but be easily carried. On such journeys his only food is a small quantity of parched wild rice, which is carried in a leather pouch and fastened to his belt. As fatigue or hunger becomes apparent a small handful of rice is eaten and the traveler continues on his way with renewed energy—arriving at his destination as fresh and well nourished as when he started.

TRIED RECIPES

By "A Yorba Linda Subscriber"

Baked Eggs

Butter well some small gem pans and dust them with bread crumbs. Drop one egg in each pan, cover with bread crumbs, adding salt, pepper and a small piece of butter. Cook in a quick oven until the crumbs are browned and the eggs have set like custard.

Coffee Ginger Cookies

Mix one cup shortening with two cups granulated sugar. Add one cup New Orleans molasses and three teaspoons soda in one cup of hot black coffee. Let mixture cool, then add one well beaten egg, two teaspoons vanilla, pinch of salt and three teaspoons ginger sifted with enough flour to roll out to make a firm dough. Cut out and bake in a quick oven.

Sugar Cookies

Cream one cup shortening and three cups sugar together; add three well beaten eggs, one small cup milk in which has been dissolved one small teaspoon soda, one small nutmeg grated and flour enough to roll. They may be varied in many ways. An orange or the peel put in the cooky jar gives a delicious flavor.

To Can Rhubarb for Pies

Cut rhubarb lengthwise twice, then cut across with sharp knife or kitchen shears making small dice. Pack hot sterilized can full. Pour over boiling water, cover, let stand for ten minutes, pour off, repeat and seal.

MADE WITH SOUR CREAM

Waffles

One egg, 1 cup sour milk, 1 cup flour, 1 tablespoon butter, 1 teaspoon soda, 1½ teaspoons baking powder, ½ teaspoon salt.

Mix and sift flour and baking powder. Beat egg thoroughly, add sour milk, flour and salt. Dissolve soda in ½ tablespoon cold water. Add to mixture. Beat thoroughly. Cook on oiled, hot waffle irons and serve hot with maple syrup.

Ginger Bread

Four tablespoons butter, ½ cup sugar, 1 egg, ½ cup molasses, 2 teaspoons cocoa, ½ cup sour milk, 1¾ cups flour, ¾ teaspoon soda, 1 teaspoon ginger, ¼ teaspoon cinnamon, ¼ teaspoon salt, 1 teaspoon allspice.

Sift flour and spices, salt and soda together. Mix other ingredients in the order given and combine mixtures. Bake in moderate oven 30 minutes.

Practice Thrift When Buying a Piano

Doing without music is not thrift. You need good music. It relaxes, stimulates and inspires. It is a wonderfully good influence on growing children. Today music in the home is a necessity—and when we speak of music we naturally think of the Piano and Player Piano.

But you can practice thrift when buying your Piano. You can see to it that you get value received. Not every Piano purchaser gets value received. Many are misled or confused by the misleading advertisements and shady methods of unscrupulous dealers. These unthrifty purchasers "fall" for exaggerated statements, special inducements and apparently very low prices—only to awaken to the realization that the instrument they purchased is only a makeshift and that it is necessary to go to a reliable dealer and buy a real piano.

To be thrifty in Piano buying, the purchaser should go straightway to a good reliable Piano House and frankly state his needs and the amount he can afford. That reliable Piano House carries many grades (when measured by price) but all dependable; they can suit your purse nicely. They will arrange convenient payment terms so that your Piano purchase will not only be an example of thrift—of getting value received, but will result in permanent satisfaction.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

SPLITDORF PEENED PISTON RING

Each charge of gasoline has a given amount of power

Write for this Booklet

And unless every ounce of power is exerted on the piston head, your engine will not develop its rated horse power. Splitdorf Peened Piston Rings positively prevent leakage between the piston and cylinder walls. They *seal* the firing chamber. They give you *all* the power you pay for when you buy your fuel.

Learn the true value of the piston ring to all farm equipment operated by the internal combustion engine. Send for booklet, "The Story of the Piston Ring." It's yours for the asking.

SPLITDORF ELECTRICAL COMPANY
92 WARREN STREET, NEWARK, N. J.

TRADE **SPLITDORF** MARK

When Writing Advertisers, Mention the Cultivator.

Sour Milk Biscuit

One quart flour, 1 teaspoon soda, 1 teaspoon salt, 1 teaspoon sugar, 2 tablespoons butter. Sour milk to moisten (about 1½ cups).

Sift dry ingredients together, cut in butter with knife, add milk to make a stiff dough. Roll out thin and bake in hot oven. Serve hot with honey or maple syrup.

Boston Brown Bread

One cup whole wheat flour, 1 cup graham flour, 1 teaspoon soda, 1 cup corn meal, 1 teaspoon salt, 2 cups sour milk, ½ cup molasses.

Mix dry ingredients thoroughly. Mix the sour milk and molasses. Stir in dry ingredients, beating thoroughly. Turn into well buttered pound baking powder cans. Cover tightly and steam 2 hours. Remove cover and dry in oven for 15 minutes. Take from can and slice with string. Raisins and nuts can be added to the dough mixture, if desired.

Spoon Bread

One pint coarse white corn meal, ½ teaspoon salt, 1 cup sour milk or buttermilk, 1 tablespoon butter, 1 egg, white and yolk beaten separately, ½ teaspoon soda for each cup sour milk.

Mix the corn meal, butter and salt with enough warm water to make a smooth paste. Then add egg, sour milk and soda. Beat until very smooth. Pour into hot, well-buttered baking dish and bake quickly in hot oven.

Sour Cream Cookies

One-half cup butter, 1½ cups sugar, 2 eggs, ½ cup sour cream, 1 teaspoon soda, flour to roll.

Cream the butter, add the sugar and eggs, well beaten. Sift soda with the flour, and add alternately with cream to first mixture. Roll out, cut, and sprinkle top with sugar.

Brown Nut Bread

One-half cup molasses, 1 teaspoon soda, 2 cups sour milk, 2 cups graham flour, 1 teaspoon salt, ½ cup sugar, 1 cup chopped nuts, 1½ cups white flour.

Mix and sift all the dry ingredients. Add molasses to the milk and combine this gradually with the dry materials. Add the nuts. Half fill baking powder cans, oil cover, let stand one-half hour. Bake three-quarters of an hour in moderate oven.

Sour Cream Salad Dressing

One cup sour cream whipped until stiff.

Add flavoring of lemon and pineapple juice during the whipping. Season with salt and a dash of curry powder, when it is to be served with vegetable salads, but using only the fruit flavoring when used on fruit salad on crisp lettuce leaves.

Suggestion

Sour whipped cream can be substituted for sweet cream in any boiled salad dressing recipe.

THE COUNTY LIBRARY

The county library is very successful and popular in California. The plan, in brief, is as follows: At the county seat or largest town in the county a central library is established, stocked with an up-to-date collection of books and pamphlets giving the best and latest information on subjects of special interest to farmers, and also carrying a wide variety of reading matter of general interest and fiction. In communities of any size, branch libraries will be maintained of similar nature. The county library also will lend books to any number of deposit stations in the county, so that the smallest community, no matter how remote or inaccessible, will have a library of its own. Deliveries will be made by trucks or book wagons to country stores, toll-gates, postoffices, school houses, private homes, or wherever the deposit stations are maintained, and upon request new collections will be sent out in exchange for the books on hand. In this way every farmer will have access to the entire collection. The expense of the service is to be met locally by county taxation; the rate to be governed in each case by the needs of the county—but limited to a small assessment.

Trifles in dress can make or mar one's appearance, and the woman who studies the little things may always be well dressed.

The Cultivator Patterns

BE SURE TO SEND SIZE

3129-3008. A Stylish Spring Suit. Coat 3129 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3008 cut in sizes: 22, 24, 26, 28, 30, 32, and 34 inches waist measure. It will require 7⅝ yards of 44 inch material for a medium size. The width of skirt at lower edge is about 1¾ yards. Two separate patterns, 10 cents for each pattern.

3130. Girls' Apron. Cut in 4 sizes: 6, 8, 10 and 12 years. For an 8 year size, 1¾ yards of 27 inch material will be required. Price, 10 cents.

2844-2854. A Stylish Costume. Waist 2844 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 2854 cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. A medium size will require 6½ yards of 44 inch material for the entire dress. The skirt measures about 1⅞ yards at the foot with plaits extended. Two separate patterns, 10 cents for each pattern.

2821. Girl's Dress. Cut in 5 sizes: 4, 6, 8, 10 and 12 years. Size 12 requires 3⅛ yards of 40 inch material. Price, 10 cents.

2950. A Stylish Frock. Cut in 3 sizes: 16, 18 and 20 years. Size 18 will require 4⅞ yards of 44 inch material. Width of skirt at lower edge, is about 1½ yards. Price, 10 cents.

3155. Girl's Dress. Cut in 4 sizes: 8, 10, 12 and 14 years. For a 14 year size, 4⅛ yards of 36 inch material will be required. Price, 10 cents.

3133. Ladies' House Dress. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A medium size will require 5¾ yards of 36 inch material. The width of the dress at its lower edge is about 1⅞ yards. Price, 10 cents.

2815. Child's Play Suit. Cut in 5 sizes: 2, 3, 4, 5, and 6 years. Size 4 requires 1⅝ yards for the waist, and 2¼ yards for the rompers, of 27 inch material. Price, 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest Chicago styles, all pattern orders are filled in Chicago. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

LITTLE SAVINGS

By Mary L. Hootman, Puente

Some of the ways of reducing the "High Cost of Living" that we use are as follows:

When eggs are the cheapest we preserve them so we can use them ourselves and then we sell the fresh ones when the price is high.

To nine quarts of boiled water use one quart of silicate of soda. Do not wash the eggs before putting them in the liquid. They keep fine.

When the collars on the men's shirts become worn I take them off, hem the raw edges of the band under, sew a button at the middle of the back, then buy 'ready-to-wear" collars to button on. This looks better and saves washing and ironing.

And then another way is to buy articles for food in which there is no loss when preparing them for cooking, such as rice and beans, which is a great saving over potatoes, in which is quite a loss in peeling.

SPRING AND SUMMER FASHION CATALOG

A notice of the Cultivator's spring and summer catalog appeared in the issue of February 14, but did not state that this would be sent only on receipt of ten cents in silver or stamps. This catalog shows 550 designs, with helps and directions to the dressmaker, fully illustrated to make easily understood. French seams, fell seams, faced hems, seam binding, couching, fagot stitch, cording, cutting bias folds, etc., are clearly explained and illustrated. It will be found worth far more than ten cents, for it is really a little hand book on sewing.

MANY RARE FISH TAKEN IN SOUTHERN CALIFORNIA WATERS

That California is still ignorant of the vast resources of the sea is evidenced by the large number of tropical fish heretofore unknown in our state, coming to the state fisheries laboratory at Long Beach. Fishermen are becoming interested in making new finds and are vying with each other in turning over to the laboratory new and unusual fish for identification.

Among the rare unknown fishes which have recently been identified is a snipe fish, picked up on the beach at Avalon, Santa Catalina Island, so called because of the long, slender snout. This fish was first named from one taken near Laysan Island in the Hawaiian group, but the fish has a wide distribution, having been found in East Africa, the Indian Ocean, China and the Mediterranean. Unlike other rare fish taken in our waters, it is so small and slow moving that it cannot well be a stray from far distant waters. This heightens the interest very greatly, as it means the discovery of what may be a new resident species.

A crested band fish, a rare and beautiful fish of strange form, was discovered swimming in the breakers at Long Beach on July 25, 1919. This strange fish is about four feet long, eight inches deep and only one and three-eighths inches wide. The skin is smooth without scales, except for a single row against the dorsal fin, and of a bright silvery color with purplish tints on the head. The eye is large, the mouth small, armed with small bristle-like teeth, and the fins are bright red. This is the first specimen which has fallen into the hands of naturalists in America. In fact, it is so rare that probably not more than a dozen specimens have ever been taken. An Italian scientist was the first to discover and name the fish.

Of equal interest is a deep sea monster, captured in the fine mesh nets of the fish and game commission's patrol launch Albacore. So rare is the great mouthed, ferocious looking creature that it has no common name. It is known to scientists is Idiacanthus antrostomus. This fish is about three inches long, jet black in color and wormlike in form. A row of luminous spots are placed on each side, supposedly supplying light, for at the depth normally inhabited by this fish there is little light. In 1890 a specimen was taken near Catalina Island at a depth of 603 fathoms, and closely related species have been taken in the mid-Atlantic at a depth of 2,750 fathoms.

The plans for the new fisheries laboratory to be built at San Pedro call for an exhibition hall where these and similar rarities of the deep sea may be exhibited to the public.

NATURAL COMPASS MARKS—MOSS

"Especial attention may be directed to a few principles and tricks of the pathfinder's trade which every scout should understand, and should be able to apply accurately and promptly in the emergency of being lost," says George Gladden in an article entitled "On Being Lost" in Boys' Life. "But he should be sure of these principles before he accepts and acts upon them. For example, probably everybody has heard that moss grows on the north side of a tree, a most convenient thing to know if it happened to be true, which, however, isn't always the case. (Remember, incidentally, that the thin, gray parasitic lichens which grow on both rocks and trees, are not moss.) True moss is to be found on that side of the tree which retains longest the most moisture, and that may not necessarily be the north side. For example, moss will grow most readily on the upper side of a leaning tree, because naturally that side retains moisture longer than the lower side. Wherefore, a believer in the moss-on-the-north-side-of-the-tree theory would be thrown completely off his course if he should be guided by the moss on a tree leaning to the north, for then, of course, the growth would be on the south side of the tree.

"Again, moisture remains longer on rough bark than on smooth, and within the forks of trees and about their swollen bases, without any regard for the points of the compass. 'Does it follow, then,' asks Kephart, 'that exposure has nothing to do with the growth of moss?' Not at all. It merely follows that a competent woodcraftsman, seeking a direction from moss on trees, would ignore leaning trees, uncommonly rough bark, bossy knots, forks of limbs and the bases of trees, just as he would give no heed to the growth on prostrate logs. He would give special heed to the evidence of trees that were isolated enough to get direct sunlight throughout a good part of the day, while those that were in the shade of cliffs or steep mountains, so that they could only catch the sunbeams in the morning or afternoon, would be ruled out of court."

MORE GOOD CAKES

Mrs. Loretta Hoyt, Modesto

Vanilla Cake: Mix in a bowl one and one-half cups flour, one cup sugar, two teaspoons baking powder. Sift these twice.

In a cup put one egg beaten lightly, pinch of salt, two tablespoons Crisco melted, one teaspoon vanilla, and finish filling the cup with sweet milk. Add to the dry ingredients and stir lightly. Bake in a moderate oven 20 minutes. Makes two large layers. Use any preferred frosting flavored with vanilla.

BAKING POWDER BISCUIT

Sift two heaping teaspoons of baking powder in two-thirds quart of flour. Make a hole in the center. Put in one-half teaspoon salt, one and one-half cups sweet milk, one heaping tablespoon fat. Mix with the tips of fingers into a dough as soft as can be handled. Place on a floured molding board and knead till smooth, roll to one-half inch, cut out with biscuit cutter, put in a baking pan and bake in a quick oven and serve at once.—Mrs. F. M. Hubbell, Woodland.

THE MATHEMATICS OF IT

She had seven million dollars
Placed in bonds and stocks and rents;
He had 'leven million dollars,
So they merged their sentiments.
Now they've raised a son whose value
Is exactly thirty cents.
—Boston Transcript.

GETTING ON

"Well, little boy, did you go to the circus the other day?"

"Yes'm. Pa wanted to go, so I had to go with him."—Kansas City Journal.

What do you drink tea for? For taste, for cheer, for gentle stimulation; for enjoyment.

Why then do you buy common tea? It costs more per cup, though less per pound, than Schilling Tea, the fine practical economical tea.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

300 Candle Power

Most Perfect Reading Lamp Known

Safe — Durable — Clean

USED by thousands and without question the finest lamp for home use ever invented. Makes and burns its own gas from common motor gasoline and **lights with ordinary matches.** No alcohol torch needed.

The **Coleman Quick-Lite**

Gives a brilliant white light of 300 candle power—20 oil lamps are not so powerful. No wick. No chimney. No daily or weekly cleaning necessary. Handsome design. Made of brass, heavily nickeled. Will last a lifetime.

15,000 Dealers sell Coleman Lamps, Lanterns and Lighting Plants. If yours can't supply you write nearest house.

The Coleman Lamp Co.

Wichita, Kan. St. Paul, Toledo, Dallas, Los Angeles, Chicago.

Dyed Her Faded Skirt, Also a Coat

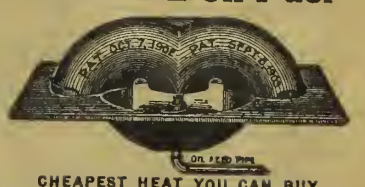
"Diamond Dyes" Make Shabby Apparel Just Like New—So Easy!

Don't worry about perfect results. Use "Diamond Dyes," guaranteed to give a new, rich, fadeless color to any fabric, whether wool, silk, linen, cotton or mixed goods,—dresses, blouses, stockings, skirts, children's coats, draperies,—everything!

A Direction Book is in package.

To match any material, have dealer show you *"Diamond Dye"* Color Card.

Save 1-2 on Fuel



CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns distillate costing only 8½ cents per gallon in cook stoves heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address **Sievert Oil Burner Co., 710 North Main St., Los Angeles.**

TOBACCO

"Old Homespun" chewing or smoking. Grown and sold by Kentucky Farmers. Not doped, just plain OLD NATURAL LEAF. Trial offer, 3 lbs., postpaid $1.20. Kentucky Tobacco Assn., Dept. 2, Hawesville, Kentucky.

Why Cleanliness Is of Prime Importance in Feeding Baby Chicks

(By George R. McLeod, Agricultural Department, Sperry Flour Co.)

ONLY prime grains should be used in the manufacture of baby chick feed. Any deviation from this rule means death to a big percentage of the chicks; while those raised will be slow in maturing and not up to the standard of those fed on clean feed.

Prime grains mean clean grains, free from smut, mould and other damage.

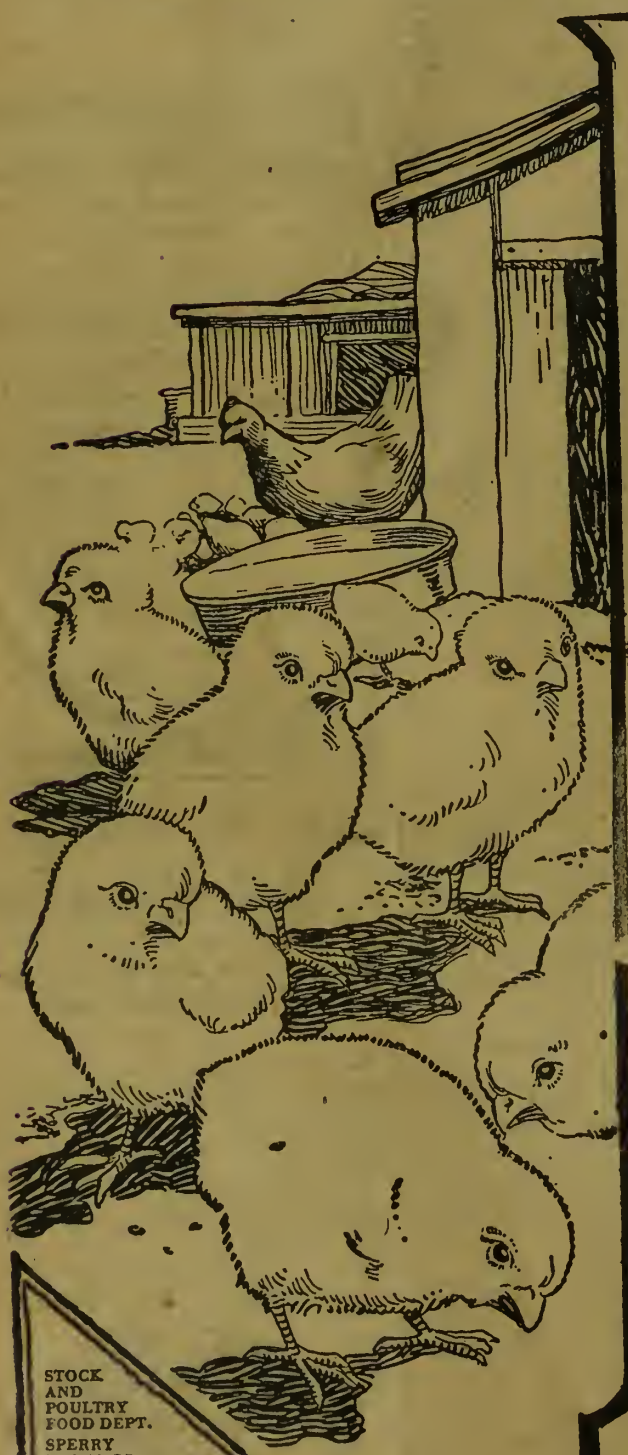
While clean feeds are necessary, it is equally essential that the feed receptacles be kept just as clean as the feed. Dirty receptacles for feed and water, or musty litter on the floor of the brooder, always result in the loss of a big share of the hatch.

Care is responsible for over half the success of a baby chick raiser. Poor ventilation and uneven temperature are often the cause of large losses which sometimes are accredited to the feed.

Care should also be taken in the selection of eggs for hatching or in the buying of baby chicks. Breeders' flocks that have plenty of range are generally healthier than those that are kept in houses or yards, and generally produce chicks with a greater amount of vitality, which develop into the best class of hens obtainable.

Chicks with poor vitality have weak constitutions, develop all types of diseases readily, and only a small percentage of the hatch can be raised, even with the best care and feed. You can't develop strong, sturdy stock out of chicks lacking in vitality.

Cleanliness Counts!



OF all the things that count for profit in the poultry business, cleanliness comes first. Because cleanliness means a healthy flock—and that means healthy profits! Therefore, the right start means everything—to the chicks and to you.

You must remember that the digestive organs of these sensitive little chicks are just as easily upset as those of a baby. Their feed must, of all things, be *clean*. No feed is good enough for a baby chick that is not clean enough for a human being.

In making Sperry Baby Chick Feed we keep this constantly in mind. Only prime, clean grains go into this feed. During its entire process of manufacture the same absolute cleanliness is observed as in manufacturing Sperry Red Package Cereals for your table.

Sperry Baby Chick Feed supplies *all* the food values that Nature intended a growing chick to have. It is clean, uniform, properly granulated and proportioned to meet the demands of fast-growing bodies. It supplies the same food values and constituents which Nature has taught the mother hen to scratch for her baby chicks.

Also—it is *absolutely gritless*. This means that you do not have to pay a fancy price for shell and grit. You merely add about 5 per cent fine shell and grit when using.

Our booklet, "Makes Hens Happy," takes up this feeding question in detail—gives you the advice of practical poultry experts. We'll gladly send it on request. Simply fill in the coupon and mail *today!*

CALIFORNIA CULTIVATOR

and LIVESTOCK and DAIRY JOURNAL

Los Angeles — An Illustrated Weekly for the Rural Home and Ranch — San Francisco

Vol. LIV — March 6, 1920 — No. 10

Days of Grace Over March 15---Return Form 1040A and Do It Now

RETURNS of taxable income, together with schedule of farm income and expenses, must be in the hands of the income tax collector prior to March 15. There will be no extension of time excepting where it can be proved that the individual has been completely incapacitated. For the sake of safety anyone who has been incapacitated should have someone report to the nearest collector or deputy with explanation of the situation.

For the farmer, in addition to the regular individual return, "1040-A," there is "Schedule of Farm Income and Expenses for the Year 1919." This is "Form 1040-F."

Again, another form will be necessary from partnerships engaged in farming. This is "Form 1065."

This last point has been brought out by investigation made by the Cultivator because of request of a Riverside County subscriber. He writes:

"My mother, a widow, brother and myself are farming. My mother owns 120 acres out of 200 acres, also owns some of the cattle branded with — — — Bros. brand. We did our banking under the name of — — — Bros., but we have always considered among ourselves we were equal partners, as she does her part as well. We do not pay rent or anything like that to her. Would we be exempt for $3,000?"

Yes, but these steps are necessary.

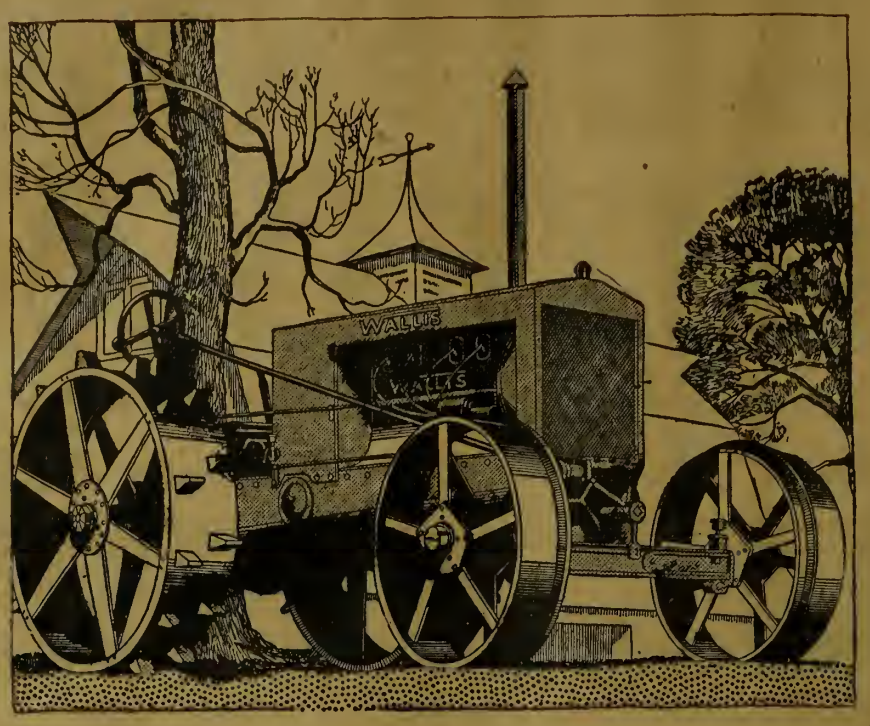
First, fill out completely "1040-F," which has to do with the farm income and expenses. Follow this with "Form 1065, Partnership Return of Income." These two reports will make the basis for three separate reports, one by the mother and one each by the brothers. This will be the regular "1040-A," providing that the income is less than $5,000 for each of the parties.

The place for making this report by each individual is on Page 2 of "1040-A" under "C. Income from Partnerships, etc."

Then the widowed mother makes her deduction of $1,000 personal exemption, as does each of the brothers in his report, unless they are married, then they deduct $2,000, before computing the tax, and an additional $200 for each child or dependent under 18 years of age.

If these reports can be filed with one of the collectors in San Francisco or Los Angeles or in one of the branches of the office which may be located in all of the larger towns of the state, personal help may be secured from assistants and field men in charge. Likewise the oath may be there administered and payment of the tax directly made. Where this is impossible any notary public may administer the oath to the one making the report and the report may be mailed to the nearest collector's office. Check or money order for the amount of the tax may accompany the Return. This may be for the entire amount or only for one-fourth. An additional amount sufficient to bring the payment up to one-half of the tax is due on or before June 15. Three-fourths must be paid before September 15, and the entire tax must be paid before December 15. It is safest to make total payment at first and prevent danger of any penalty. Greatest care should be used in making out returns, for penalties "for making false or fraudulent returns" are heavy. There may be severe penalty for failure to make return on time. This may be $1,000 and in addition 25 per cent of the amount of tax due.

There are two methods of procedure open to the farmer. First, if he is a careful bookkeeper and made on January 1, 1919 complete inventory of equipment, livestock, supplies of hay, grain, feed, etc., a complete inventory made again on December 31 of the same year would give, in addition to net cash income, the exact, correct amount which is taxable. Or, again, he may keep careful cash book account, which, with all farm expenses deducted, will make basis for computation. In the inventory plan the total value substracted from the total of all farm receipts and inventory value at end of the year gives the farm income.— (Continued on Page 382).



TO feel the steady, powerful rhythm of the Wallis as it forges ahead, leaving row upon row of clean-cut furrows in its wake, is a never-ending delight to the Wallis owner at plowing time.

Then, most of all, the clock-like regularity and almost human faithfulness of this quality tractor make money for its owner.

Only one thing has made this condition possible. The Wallis is basically right. Wallis engineers have proved time and time again that the Wallis represents the ultimate in tractor building.

This medium lightweight machine is endowed with tremendous strength by such advanced ideas as the "U" frame construction; the beautifully finished cut-and-hardened steel gears carefully protected from dust and dirt in steel housings, where they operate in a constant flow of clean oil; the valve-in-head engine with removable cylinder sleeves and completely machined combustion chambers; the oversize bearings.

These refinements you find generally only on high-grade motor cars or trucks. Most men would think it ridiculous to build so carefully a machine designed to plow around in the dirt, mud, sand, and rocks of the fields.

Wallis has proved that these very things alone can give a tractor the power and durability to work faithfully and long under these conditions.

Some day all men are going to believe in the Wallis principle. That the number of converts is growing is indicated by our difficulty to keep up with the demand.

If you want a Wallis we advise you to act at once.

New Soil in the Orchards

By William M. Bristol

THE only known bank upon which a man may draw checks without first making a deposit is Nature's Bank of the Soil. And even at that beneficent institution there comes a time when he is certain to get notice that his account is overdrawn unless he has formed the habit of making deposits therein.

There is no producer, perhaps, who writes more checks on the Soil Bank than the orange grower. There are few men who authorize every member of their families to draw checks on their commercial bank deposits. Yet the demand of every orange tree is honored at Nature's Bank so long as any legal tender remains in its vaults. I have known some men who seemed to regard the soil as a mine and a bottomless one at that. I prefer to regard it as a combined factory and storehouse for the raw materials needed in the production of crops.

But in spite of nature's marvelous preparation for man her soil deposits are not always to his liking. Sometimes, from the orange grower's viewpoint, they are either too loose or too compact, and within the past decade he has formed the habit of changing them. I do not know what is being done elsewhere, but in the Redlands-Highland region tens of thousands of loads of fresh soil are being hauled into the orchards. The practice was begun in the case of the hard soils. The first grower who tried it on a major scale was J. E. Woodruff of Redlands. The soil in his 12 acre Valencia orchard, on a rolling ridge at the west end of Smiley Heights, was as red as an Indian and as hard as a sunbaked brick. A stream of water the size of a lead pencil would run across it and most of the stream would reach and run off in the waste ditch. The red soil deposits found scattered about Southern California, remnants of the oldest soil beds of the region, although deficient in nitrogen, are rich in the mineral elements of fertility. Although nature has stored abundant quantities of potash, phosphoric acid and lime therein, she has put such restrictions on their removal that man must be both ingenious and industrious to get them, a restriction, perhaps which the wise man will in time approve. Close observers have noted the evident durability of these hard soils, and at the same time have made plans to make them yield up their potential treasure.

Down in the bed of San Timoteo Canyon, two miles from the Woodruff orchard and 200 feet below it, the soil is a sandy sediment. Mr. Woodruff purchased a tract of this soil and entered upon the Herculean task of lifting a portion of it to the orchard on the heights. The hauling was done with teams—and it goes without saying that it was not the work of a day. In the course of time, however, he covered that refractory tract of 12 acres to a depth of at least six inches with the sandy sediment. I do not know if he kept a record of the cost. The work was done when his teams were not needed elsewhere. But whatever the cost, the expense was amply justified by the results. I have no definite statistics on the before and after crops. I do know, however, that a year later his orchard was yielding 15 boxes per tree while that of his neighbor, where every condition was identical except as to the new soil deposit, was yielding from one to three.

This is what happened as a result of covering the hard soil with a blanket of loose: The irrigation water went into the soil instead of into the waste ditch. When water runs across a fine grained soil on a grade steeper than one and one half per cent, and much irrigation is done on a steeper grade, it cuts the soil and carries particles of it in solution. In other words, it "runs muddy," and every irrigator knows that muddy water does not penetrate. Water will run over sandy or gravelly soil on a much steeper grade and still be clear because there are few particles of clay for it to pick up. Consequently, when it is turned into the furrows in the blanket of loose soil which has been spread upon clay it sinks to the clay in its clear condtion, is distributed widely over it, and penetrates it. In fact it spreads so widely that one furrow is sufficient where three were needed before, for the water becomes a sheet all over the surface of the clay.

Another advantage gained is the ease of cultivation. My own practice is to avoid going deep enough to bring up the red soil and mix it with the loose, because the clay has the same effect upon it that cement has upon sand; in other words, it defeats the purposes for which the loose soil was applied.

In some instances pure wash sand has been used to cover the red mesa soil because it was easier to get. While it contains practically no fertility it is doubtless more efficient from the standpoint of mechanical effect than the sandy loam. The East Highlands Orange Company has used thousands of loads of decomposed rock from the foothills on its property. The loose blanket being the chief object in the case of the hard soil, it seems to matter very little what is its character as to fertility.

I come now to the inverse process, the use of hard soil upon loose. In the mad rush to expand the citrus belt the planting of orange trees has been extended to tracts which might be designated as soily gravel instead of gravelly soil. While these gravel beds may have originally contained fair amounts of humus and nitrogen they were soon leached out by irrigation. Water may be run across compact soil indefinitely without robbing it of its nitrogen if the grade is light and the water goes off without carrying any soil with it. But gravelly soil under irrigation loses it humus and nitrogen quicker than the purse of a spendthrift loses its cash. Sand, with ten per cent of its bulk of cement added makes a fair grade of mortar; and it has been amply proven that a six inch layer of clay soil spread upon a loose gravelly soil will make it fairly compact and will add a thousand dollars per acre to its value for orange growing purposes.

A notable demonstration of what can be done along this line may be seen on the Yerxa tract at West Highlands, where experimentation was begun about four years ago. Perhaps 100 acres of the tract was so loose that it might properly be likened to a stack of sand sieves. Five years ago I would not have accepted it as a gift. Today it has $1,000 worth of oranges per acre on its 20 year old trees, and the transformation is due to the six inch layer of clay soil that has been spread over it. Again nature was bountiful in her providence, for an inexhaustible deposit of red clay loam lies immediately above the orchard tract and it is simply a matter of loading the stuff on wagons, hauling it down hill to the desired place and dumping it. In this instance I will grant that the soil is a mine, and an exceedingly valuable one at that. Words cannot picture the marvelous effect of the new soil upon the impoverished trees, and there are no "before" views of them available. Any one who has a bankrupt orchard on a bankrupt gravel bed will do well to see this miracle, for even if I had both before and after pictures of it and were to attach my affidavit to them my story would not be believed. Since seeing the tract a few days ago (for the first time in five years), I am wondering if loose soil with an application of clay is not worth more than hard soil with a blanket of sand. Anyhow, with due respect for Nature's Bank of the Soil, I am impressed with the improvements man can make upon it. Anyone wishing to substantiate my statements regarding the clay upon gravel treatment should communicate with the manager of the Yerxa tract, Capt. Thos. W. Frye, of Highland. I think the genial captain will be pleased to show all visitors what he has accomplished. As to the effects of sand upon clay almost any orange grower in either Redlands or Highland can point to a demonstration of its value. It is not claimed that in either case the need of fertilizer is done away with, but it has been proven that none will be needed for a couple of years after the new soil has been applied. It is not yet known how far the practice may be carried with profit or how deep the deposit may eventually be made. Experiments so far made indicate that the feeding roots continue to approach the surface with each fresh application, and there is one small orchard in Highland where a fill of three feet was made at one point, for the purpose of changing the direction of irrigation, without any ill effect upon the trees. I should add that this fill was made at least a dozen years ago.

There are some citrus orchards in California with no surplus soil deposits near at hand, but a large majority of them are near to the foothills where billions of tons of good top soil are waiting to be scraped from the sides of the canyons and ridges and transferred to the orchards to refresh and rejuvenate them and to lessen their need of water and fertilizer. So far most of the loading has been done by the primitive method of shoveling; but mechanical power devices must be constructed for putting the soil on the wagons or trucks which are to convey it. Until these devices are provided we could spare a few thousand real estate agents—land transfer experts—to wield the ancient and honorable shovels.

Melilotus Indica for Cover Crop
Crops of green manures are short this year but there should be no delay in turning under.

A Humus Former Sometimes Used—Shavings

Agricultural News Notes of the Pacific Coast

Northern California

The cooperative rice mill at Biggs has been sold and will be moved.

There were 166 exhibitors at the recent San Francisco automobile show.

Buyers are now offering $45 per ton for northern Sonoma County wine grapes.

The light rain of last week proved wonderfully beneficial to stock ranges and pastures.

Horticultural Commissioner Bremner of Sonoma County is staging gopher week.

Colusa County rice growers are sinking wells for emergency use in case of water shortage.

There was general observation of "Save the Redwoods Day" all over Northern California.

Yolo County claims location of the big Virden packing plant, which will be at West Sacramento.

Notwithstanding the dry season, there has been general planting of orchards at Orland, Glenn County.

Williams, Colusa County, is hoping for the establishment of a $50,000 warehouse and cooperative rice mill.

Geo. E. Merrill, farm adviser of Sonoma County, died at his home of pneumonia. He was 37 years of age.

The Solano County Cattlemen's Association held its annual banquet at the Arlington Hotel, Suisun, last week.

Two thousand additional acres in Yolo County will be brought under irrigation by the new Capay Valley ditch.

Vacaville, Solano County, has a large committee directing a drive for greatly improved road system in that county.

The organization committee of the Glenn-Colusa irrigation district is raising a $200,000 fund for improvement of the system.

Poultrymen of Alameda County, under the management of the farm bureau, held last week a series of meetings at Castro Valley, Independent and Livermore.

The traveling farm bureau conference will make its trek northward this year in April. Butte County is already making plans for entertaining the delegates.

California nurserymen have invested $150,000 in a bud selection and production orchard which shall supply to individual members buds and seeds which have been standardized.

The Suisun Valley Fruit Growers Association, recently organized, has filed articles of incorporation as a purely cooperative association for handling fruits of its members.

Producers of the Sacramento Valley are being urged to grow crops other than rice this year, at least so far as possible, so as to conserve water by producing crops which ripen earlier.

The Sonoma County Fair Association is being revived. New directors have been elected and the old fair grounds at Santa Rosa is being prepared for a county fair some time during August.

Sacramento Valley rice growers have organized and at a recent meeting at Yuba City serious consideration was given to the water and power shortage, and it was determined to make every effort to secure justice to rice producers in distribution of water and power.

Central California

Tulare is to have a cotton gin.

Modesto is to have a new cannery.

Two canneries are building at Reedley, Fresno County.

Turlock fat hog auction brought $14.90 for the best lot.

Fresno reports offers of 25 cents for next season's dried peaches.

Many communities are planning observance of Arbor Day, March 7.

Modesto irrigators have nearly all endorsed the Don Pedro project.

Larkin Valley, Santa Cruz County, is organizing a farm bureau center.

California wine grape growers are organizing a marketing association.

"Everybody irrigate" is the slogan of growers of the San Joaquin Valley.

Madera County farm bureau has reelected J. W. Schmitz president another year.

Merced County Poland-China people held their first auction of pure breds February 21.

Dinuba is planning for a big dehydrating plant to be constructed in time for the coming season's output.

Sequoia national park in Fresno County is to be enlarged if the plans of Fresno people are carried out.

Nearly every vineyard in the San Joaquin Valley shows a busy scene as the pruners are finishing the season's work.

Secretary Miot of Tulare County board of trade reports great increase probable in cotton culture the coming season.

The Tulare Cooperative Poultry Marketing Association shows an increase of over $7,000 over last year's business.

The farm center at Stevinson, Merced County, is taking the initiative in forming an irrigation district under the Wright act.

Farm owners and operators held a mass meeting at San Jose recently and discussed water shortage and methods of conservation.

River navigation control will yield so far as possible during the coming season to give to irrigators greater supplies of water.

One San Joaquin Valley irrigator is claiming that money spent in securing legislation would yield more water than in sinking new wells.

Members of the Milk Producers Association of Central California are hoping for the early construction of a powdered milk plant at Modesto.

Exeter, Tulare County, has shipped 826 cars of fruit. This does not include dried peaches and apricots, which would increase the total to nearly 1,500 cars.

State Director of Agriculture Hecke has been conferring with producers of Watsonville, Pajaro Valley, regarding revision of present apple standardization act.

Grape growers met last Saturday at Berkeley and conferred with specialists of the university as to methods of handling wine grapes to secure greater returns.

In a drive of the Cattlemen's Association for new members meetings will be held at Merced, Saturday, February 28; Mariposa, March 6; Livermore, Alameda County, March 13; Nevada City, March 20.

Southern California

West Riverside is growing tobacco.

California farm bureau members now total 22,000.

Coachella Valley, Riverside County, people are already eating green corn.

Alfalfa growers are appealing for new members to the state association.

More attention has been given to storage of flood waters than any preceding year.

The Olive Heights Citrus Association received an average of $3.36 per box for oranges.

Extreme cold in the East has caused loss to spinach and lettuce shipped from Imperial Valley.

Walnut men in Lankershim are organizing to market through the Walnut Growers Association.

Riverside County Cow Testing Association reports 89 cows averaging over 40 pounds per month.

Lima bean producers are talking of lowering growers prices in order to move some of last year's crop.

Congress has voted an appropriation of $19,000 to maintain the kelp plant at Summerland, Santa Barbara County.

The lands at the state hospital in San Bernardino County will have a liberal planting of different varieties of cotton.

Gopher demonstrations have been held in many parts of Los Angeles County under management of its farm bureau.

Santa Paula lemon pickers are out on strike. They are mostly Mexicans and are being replaced so far as possible by American pickers.

Farm Adviser Shaper of San Bernardino County has tendered his resignation and accepted a position as business manager of Hollow Hill Farm.

March aviation field is instructing forest rangers in wireless telegraphy, airplane patrol, and other qualifications which make for better fire patrol.

The recent rains fitted soil of citrus orchards for plowing under of cover crops. Owing to dryness and cold the tonnage to be plowed under will be light.

Ventura County still discussing matter of holding an agricultural fair and solicitors are now out asking producers to make plantings with the fair in mind.

An orchardist of Perris, Riverside County, recently planted walnut trees which cost him over $900 and thieves came in with auto truck and took away every tree.

Farm Adviser R. N. Wilson of Riverside County has resigned and accepted work with the Agricultural Legislative Committee and will have his headquarters at Sacramento.

The Imperial County farm bureau has passed resolutions asking "in the name of common justice to the taxpayers" that the county highway commission tender its resignation.

Estimates of the coming cantaloupe crop of the Imperial Valley indicate a valuation of over $11,000,000. There will be nearly 20,000 acres and it will require nearly 10,000 cars to transport the crop. Last year's crop required 7,838 cars and brought return to the valley of $9,000,000.

The Coast and General

Salt River Valley, Arizona, lettuce producers are shipping.

Idaho recently held rabbit drive in which 30,000 rabbits were slain.

Arizona's livestock sanitary board reports destruction of 2,700 predatory animals during 1919.

The floods of Southern Arizona are subsiding somewhat, but streams are still nearly bank full.

Owing to reduction in pasturage, Salt River Valley, Arizona, is carrying fewer cattle than usual.

Lane County, Oregon, sold through the Portland stockyards during 1919 stock to the value of $166,076.36.

The Smith-Hughes department of the Hood River High School is conducting a school egg-laying contest.

Clarke County, Washington, claims a membership of 1,200 in the Triple Alliance and 600 in the Non-Partisan League.

School children of Denver are being given lessons in practical forestry by specialists of the department of agriculture.

A fair association has been organized in Moro County, Oregon. A site will be purchased and a fair held the coming fall.

Lane County, Oregon, is increasing its number of dairy cows. The movement is being encouraged by bankers of the county.

Fifteen hundred acres of prunes in Clarke County, Washington, have been gathered together in a cooperative marketing association.

Arizona reports wheat, oats and barley as promising a magnificent crop. The recent storm aggregated an inch and a half to five inches.

One hundred and seventy-six different models of automobiles were exhibited at a recent Portland show in connection with its ice palace.

From present indications the watermelon planting of the Salt River Valley of Arizona, will be far below normal, possibly not more than 50 acres.

The convention of the Arizona Cattle Growers Association was recently held for three days at Tucson. The next convention will be at Phoenix.

It is expected that the lettuce shipment from the Salt River Valley of Arizona will total about 200 cars. Lettuce sold recently in the New York market for 30 to 50 cents per head.

Honey producers of Maricopa County, Arizona, have effected a temporary organization known as the Maricopa County Honey Exchange. They propose to assess the members $1 for each stand, which will furnish a working capital for marketing the honey cooperatively. The honey producers will have the assistance of the Arizona college of agriculture in perfecting their organization.

Some of the sheep men of Arizona are protesting bitterly against the policy of forest reserve officials in eliminating sheep from the Crook and Tonto national forests, and to the restriction of the area of the driveways between the northern grazing grounds where sheep are pastured in summer and the desert in the southern part of the state which affords much winter pasture. Some of the sheep men claim that this policy will result in destruction to the sheep industry if continued.

The American Beet Sugar Industry

WE recently saw discussion in one of California's largest daily papers—or, more correctly, it was an assertion—that California's future as a beet sugar producer is not as bright as the state's well wishers would desire. The statement was made that owing to the exceedingly high price of lands, coupled with the popular call for great quantities of vegetables and small fruits, lands formerly growing sugar beets would be devoted to other uses. This article also called attention to the fact that sugar manufacturers are not able to pay the price which producers feel they should have.

We believe the latter reason is the principal one affecting California's sugar production. Colorado growers are receiving greater returns than are producers in California. Here the markets seem to have been so controlled that the growers' contracts do not return a living wage and sometimes even, as was the case some two or three years ago, actual loss is suffered by nearly every producer of beets while the factories during the same year declared exceptionally large dividends, in one case known to be around 100 per cent. No industry can live under such diivsion of its returns.

It is to be noped that the California sugar beet situation will be materially improved for there are lands which will produce large crops of sugar beets but are not fitted for many other crops. The world's need for sugar calls for every possible encouragement of the industry.

Here are some figures recently given by Martin J. Kermer in "Sugar." America is producing a mere fraction of her own consumption.

* * *

There never has been a time in the history of our country that we realized the importance of this industry as we do today. During the war we took the sugar shortage as a matter of fact. We were instructed to save our sugar for the boys over there. We were glad to help wherever we could, and felt sure that as soon as Germany was licked we could have all we wanted.

Today it is different. The war is over, the boys are back home—but sugar seems far from plentiful, judging from the prices that we have to pay. We hear all kinds of rumors, and we are frank to state that we don't know what to believe or where we are at. We know this much, that there is something wrong, but we have so much to think about these days and there seems so much wrong that we like to forget about it, merely taking it for granted and living in hopes that time will take care of it.

We must be an independent nation and we can be independent in every sense of the word. We have the resources, the brains and the money to develop them. The beet sugar industry is one of them that needs your attention.

My object in presenting this paper is to put before you the present status and the possibilities of further developing this great American industry.

The total world production of sugar for this year, expressed in terms of refined, is approximately 16,500,000 tons of 2,000 pounds each. Of this the United States produces 915,000 tons, of which 795,000 tons were beet and 120,000 tons were made from cane. In other words, the United States produces approximately 5½ per cent of the world's production. In regard to our consumption, we used last year approximately 4,000,000 tons, or 22,200,000 pounds per day, or 76 pounds per capita per annum. We are, therefore, consuming one-fourth of the world's production. We are producing approximately 23 per cent of what we consume. Another 24 per cent comes from Hawaii, Porto Rico and the Virgin Islands, while the remainder, over 53 per cent, comes from the Philippine Islands, Cuba and other foreign countries.

It will be interesting to know that from 1865 up to 1914 our consumption of sugar per capita per annum has gradually increased from 18 to 89 pounds. However, ever since the world war started this consumption has been reduced year by year, due to the shortage of the world's production, which necessitated our restrictions. Today the world's production is 2,800,000 tons less than it was in 1914.

If we consider the increase of consumption per capita per annum for this country from 1900 to 1914, it is safe to say that we would have reached 100 pounds per capita per annum, if conditions had been normal. Australia consumes per capita 113 pounds; United Kingdom, 85; Germany, 30; France, 28; Belgium, 26; Russia, 14; United States of America, 78.

Before the world war broke out we held the fourth place among the beet sugar producing countries. Today we are taking the second place. However, this new position is not due to our increased production, but to the decrease that has taken place in Europe.

Europe produced in 1913-14, 9,827,000 tons, while in 1919-20 she produced 3,503,000 tons, or a difference of over 6,300,000 tons.

France had in 1913 217 sugar factories, of which 213 were in operation, producing 877,000 tons. The sugar consumption in France at that time was approximately 700,000 tons. During the campaign of 1914-15 only 69 factories were in operation, producing 303,000 tons, while in 1916-17, 65 factories; 1917-18, 61 factories; 1918-19, 51 factories were in operation, producing in that year 110,000 tons.

According to the latest information, 135 factories have been totally destroyed, in many cases now being represented by a hole in the ground, while 31 have been more or less seriously damaged or their machinery stolen. According to the official report it will require $200,000,000 to put them in operating condition, which, I believe, is a very conservative figure, as it not only includes the factory proper, but also the beet sheds, railroad sidings, etc.

Before the war Europe had some 1,250 beet sugar factories in operation and the European countries have realized for a long time the importance of the beet sugar industry. These governments were justified in encouraging the sugar industry, as it not only meant the development of the sugar industry proper, but also its allied industries. Sugar does not contain any plant food, while on the contrary we are shipping yearly to foreign coun-

(Continued on Page 413.)

Laying Out the Home Grounds

By Ernest Braunton

BEFORE planning the home grounds it is well to ask yourself what you want. Have you a well defined list of the comforts and conveniences, the beauty spots, features, effects and accessories you wish your garden to have? If not, sit down and think the matter over seriously.

Jot down on paper all of these you may think of. Look thoroughly through some book on gardening for suggestions or to check up your list and see what you have overlooked. Then, and not until then, are you ready to plan or have a professional designer plan for you. You must know what you want before work starts or you may disrupt a well conceived plan with something hard to introduce after work is under way.

Here is a list of a few things you should consider: Garage, greenhouse, tool house, poultry house and other buildings, vegetable garden, drying yard, tennis or croquet courts, place to burn or compost rubbish, to propagate or store plants, fertilizers, etc. Then come entrances for man, beast or autos, with the necessary roads and paths. All will want something of pool, pond, or fountain, swimming pool, pavilion or covered lookout, arbor, pergola, seat, sundial, shade r shelter, jungle or open distant view. Next we must look into the garden for effects, color schemes, views and the things in plant life we like; trees, shrubs, vines, lowly plants, flowers and fruits, borders, rockeries, ferneries, and collections of special plants or hobbies. My, what a list! May we have them all? Not unless both place and purse be large. You must list those things that you "just can't live without." If your garden is small and your purse slender you will be able to do your own planning, but if you wish many of the features listed an expert should be called to plan your grounds.

Now let us go over this list for locations and conveniences. Keep all buildings together if you can. Nothing about a place can look worse than a lot of secondary structures widely scattered. If one roof could cover all outside the dwelling it would be well. Sometimes small buildings may be grouped around poultry yard, vegetable garden, etc., or one continuous building could surround a court or patio. Chicken houses could open upon the court; garage and other compartments could open to the outside only. Keep the more offensive things farthest from house or ornamental grounds.

Nature makes no roads or paths; therefore have none not needed. Do not make any of these turn or twist about in ridiculous or abrupt curves. Long graceful curves are beautiful, but if distances are short and the object to which the path leads be one of utility and oft approached, the path may be straight unless it is desired to hide the object or building. Do not run paths to inconsequential objects or places or have too many or a complexity of paths or roads. Do not have them wider than necessary and seek to keep those leading to utilities separate from those that serve the pleasure grounds.

Try to keep strong or unusual features as far from the house as possible, for the latter should in no wise be made to compete with aught else. Tennis and other courts, swimming pool, etc., with their attendant noises, should be kept at a distance. Some distinct features are best in secluded parts; fish pond, rock garden and arbor are examples. Others may be close to the dwelling or even attached thereto, as a conservatory for ornamental plants; and a sundial may be so close to a much used doorway as to suggest its practical use as a time recorder or in a part so remote from the house as to suggest reliance upon it instead of the house clocks. Drinking fountains may be far away for the same reason, as may those of rustic design for water display, but if large and architectural in style they should be closely associated with other architecture. So too should stately plants, such as columnar palms, be planted close about the house and massed shrubbery, tree groups, thickets, etc., kept far away, as being a part of the wildwood.

If one lives in a sparsely settled community or where farms are large it may be you will wish to see your neighbor's house or houses. But if you would be truly rural you will blot out all evidences of civilization possible. Stand before your principal windows, on your front porch, etc., and have someone walk to the edge of your property and set a stake between you and a view of the nearby dwelling or other building and here plant a tree or group of trees. Do this only at boundary points, not nearer to your dwelling or you restrict your own views.

Between these obscuring trees or tree groups leave the views to distant parts open, for all that you see you may feast upon whether in your possession or not. Within your own grounds blot out undesirable views, features, objects or buildings by the same means or cover unsightly structures with a charitable mantle of vines. Color schemes are not necessary except to avoid magenta, which harmonizes with nothing except white flowers or green leaves, and avoid planting two shades of pink close together, for the lighter one will always appear to have faded when in contrast with the stronger shade.

In grouping trees and shrubs keep those light and airy of foliage and light of color in the foreground that it may be light and delicate in contrast with the heavy and dark of the background. This adds apparent depth to your premises. We also know that blue flowers apparently lengthen distances and yellow flowers shorten. Therefore plant yellow on points toward the house and blue in the recesses so the depths and contrasts may appear greater and stronger than they really are.

Alkali Effects on Citrus

DR. W. P. KELLEY of the citrus experiment station, Riverside, has given attention for some years to alkali content of soils and its effects. In the issues of the California Cultivator of July 12 and July 19, 1919, Dr. Kelley discussed at some length the effects of using waters carrying a small percentage of alkali. The University of California now issues Bulletin 318, "Effects of Alkali on Citrus Trees," by Dr. Kelley and E. E. Thomas. Every citrus grower will want this bulletin. It may be had by addressing Agricultural Experiment Station, Berkeley. We quote from the introduction:

It is generally believed that citrus trees are especially sensitive to alkali. One of the best known investigations on the effect of alkali on citrus was published by Loughridge in 1898. In this paper it was pointed out that orange trees may be severely injured by the use of saline irrigation water. From studies on certain groves near Corona it was found that severe injury had been produced as a result of irrigating with saline water from Lake Elsinore for a period of from three to four years.

Analysis of the water showed it to contain 917 parts per million sodium chloride (common salt), 377 parts per million sodium sulphate (glauber salt) and 391 parts per million sodium carbonate (black alkali). Loughridge concluded that the injury to the trees was due directly to the corrosive action and puddling effect of the black alkali and indirectly to the antiseptic action of the sodium chloride on the bacterial processes of the soil.

The effects were more pronounced in certain groves than in others. Inherent differences in the soil apparently exerted an influence on the depth to which the water penetrated, and therefore caused the salts to accumulate in greater quantities in the upper layers of the soil of certain groves than of others. On the whole, the effects were roughly proportional to the concentration of the alkali salts that had accumulated in the zone occupied by the roots of the trees.

The results of this investigation indicated that citrus trees are quite sensitive to alkali, and that the length of time a given supply of saline irrigation water may be used without producing injury depends mainly on the rate the injurious constituents accumulate in the layers of soil occupied by the roots of the trees.

In 1900 Hilgard pointed out that citrus trees are especially sensitive to sodium chloride. He called attention to the previous work at Corona in which it had been found that 2,520 pounds per acre of sodium chloride distributed through the soil to a depth of four feet, caused an orange tree to become completely leafless, while another tree nearby, where the soil was similar in other respects, but contained only 720 pounds per acre of sodium chloride, was much less severely injured. "Here it is apparently the excess of common salt to which the difference is due."

In 1901 Loughridge called attention to the extreme sensitiveness of the lemon tree. He said: "The lemon seems to be the least tolerant of all of the fruit trees, for it was stunted by 1,440 pounds common salt per acre, distributed through four feet depth, and was killed by 1,900 pounds combined with 1900 pounds carbonate of soda."

In harmony with the conclusions of Loughbridge and Hilgard, recent investigations by the writers have shown that different varieties and species of citrus trees are quite sensitive to alkali, especially so in the case of the lemon, and that after a few years' irrigation with saline water both lemon and orange trees may be severely injured. Again, it has been found that the effects produced by a given supply of impure irrigation water may, for a time at least, be extremely variable even in different portions of the same grove. Part of this variability is probably due to differences in the depth to which the water penetrates, which in turn affects the rate at which the salts accumulate in the root zone.

Experience in various localities has shown that, under certain conditions, continued irrigation with comparatively pure water also tends to hasten the accumulation of injurious amounts of soluble salts. Several hundred thousand acres located in different parts of California, which were free from injurious amounts of alkali previous to the introduction of irrigation, have since become veritable alkali lands. Seepage, together with a rising water table incident to over-irrigation, have been the principal means by which the salts have been brought up from below and deposited near the surface. Small areas of citrus groves have already become heavily charged with alkali by this means.

In the course of investigations on the nutrition of citrus trees, we have devoted considerable study to certain phases of the alkali problem. Early in this work, it became evident that the existing state of knowledge was inadequate. The symptoms of alkali injury have not been recognized clearly. The relations of fertilizers to the problem, and especially the effect of applying irrigation water containing alkali salts, are inadequately understood and appreciated.

It is commonly held that alkali injury is mainly, if not entirely, due to excessive concentration as such. In the course of this work, it has become evident, however, that injury may be produced under certain conditions where the total concentration is relatively low. The data obtained in a study of this phase of the subject afford the basis for an interesting hypothesis which will be presented elsewhere and further work is in progress. The discussion in this bulletin will be confined mainly to the effects of excessive concentration.

As this work has progressed, it has become increasingly evident that many of the citrus growers of California have not sufficiently grasped the significance of alkali in citrus culture. Especially is this true in regard to the bearings of impure irrigation water on the accumulation of alkali in the soil. Fortunately, a large percentage of the citrus soils was free from alkali previous to the introduction of irrigation and very much of it still remains free. There are considerable areas located in several districts, however, where harmful amounts of alkali have accumulated as a result of applying saline irrigation water, and still other areas, not yet seriously injured, where alkali is accumulating at present as a result of orchard practices which, if continued, will ultimately produce injury.

Double Your Cultivation With An Avery Motor Cultivator

With an Avery Motor Cultivator you can cultivate double or more acreage than one man can ordinarily handle with horses. You can cultivate 18 to 20 acres of corn, cotton or other row crops a day—make a 160-acre farm a one-man job. It is also easy to operate—a boy or man can handle it without previous experience, and can do better work than with a horse-drawn cultivator.

Has a variety of speeds that can be controlled to suit the size of the growing crop. You can creep along slowly when the crop is small and tender, or you can go as fast as you like when the crop is large. Hot weather and flies can't stop or bother it.

Cultivates Any Row Crop

Avery Motor Cultivators are built in two sizes—a six-cylinder two-row and four-cylinder one-row machines. The two-row size is built in widths for crops planted in any width rows. Can also be furnished with various styles of front wheels so that all row crops, such as corn, listed corn, cotton, peas, beans, beets, potatoes, asparagus, tomatoes, etc., can be handled successfully. Can also be furnished with planting attachment for planting such row crops as corn, cotton, peas, beans, etc.

A Proven Success

Avery Motor Cultivators are a proven success—their design is right and they are built right. They lead in power, durability and simplicity. As many as 6 to 25 of these machines are being used by the same men who are farming on a large scale. *In one locality within a radius of 18 miles, over 100 Avery Motor Cultivators are in use.*

Besides cultivating and planting row crops, the Avery Motor Cultivator is also being successfully used for many other kinds of light field and belt work. It is adapted to more kinds of work than any other machine, and is one of the best motor farming machinery investments you can make.

The Avery Line

Also includes tractors for every size farm. Six sizes, 8-16 to 40-80 H. P. with "Draft-Horse" Motors and "Direct-Drive" Transmissions. Two small tractors, Six-Cylinder Model "C" and 5-10 H. P. Model "B." "Self-Lift" Moldboard and Disc Plows, Listers and Grain Drills, "Self-Adjusting" Tractor Disc Harrows. Also, roller bearing Threshers, Silo Fillers, etc.

Write for the Avery Catalog and interesting Tractor "Hitch Book." Both books free.

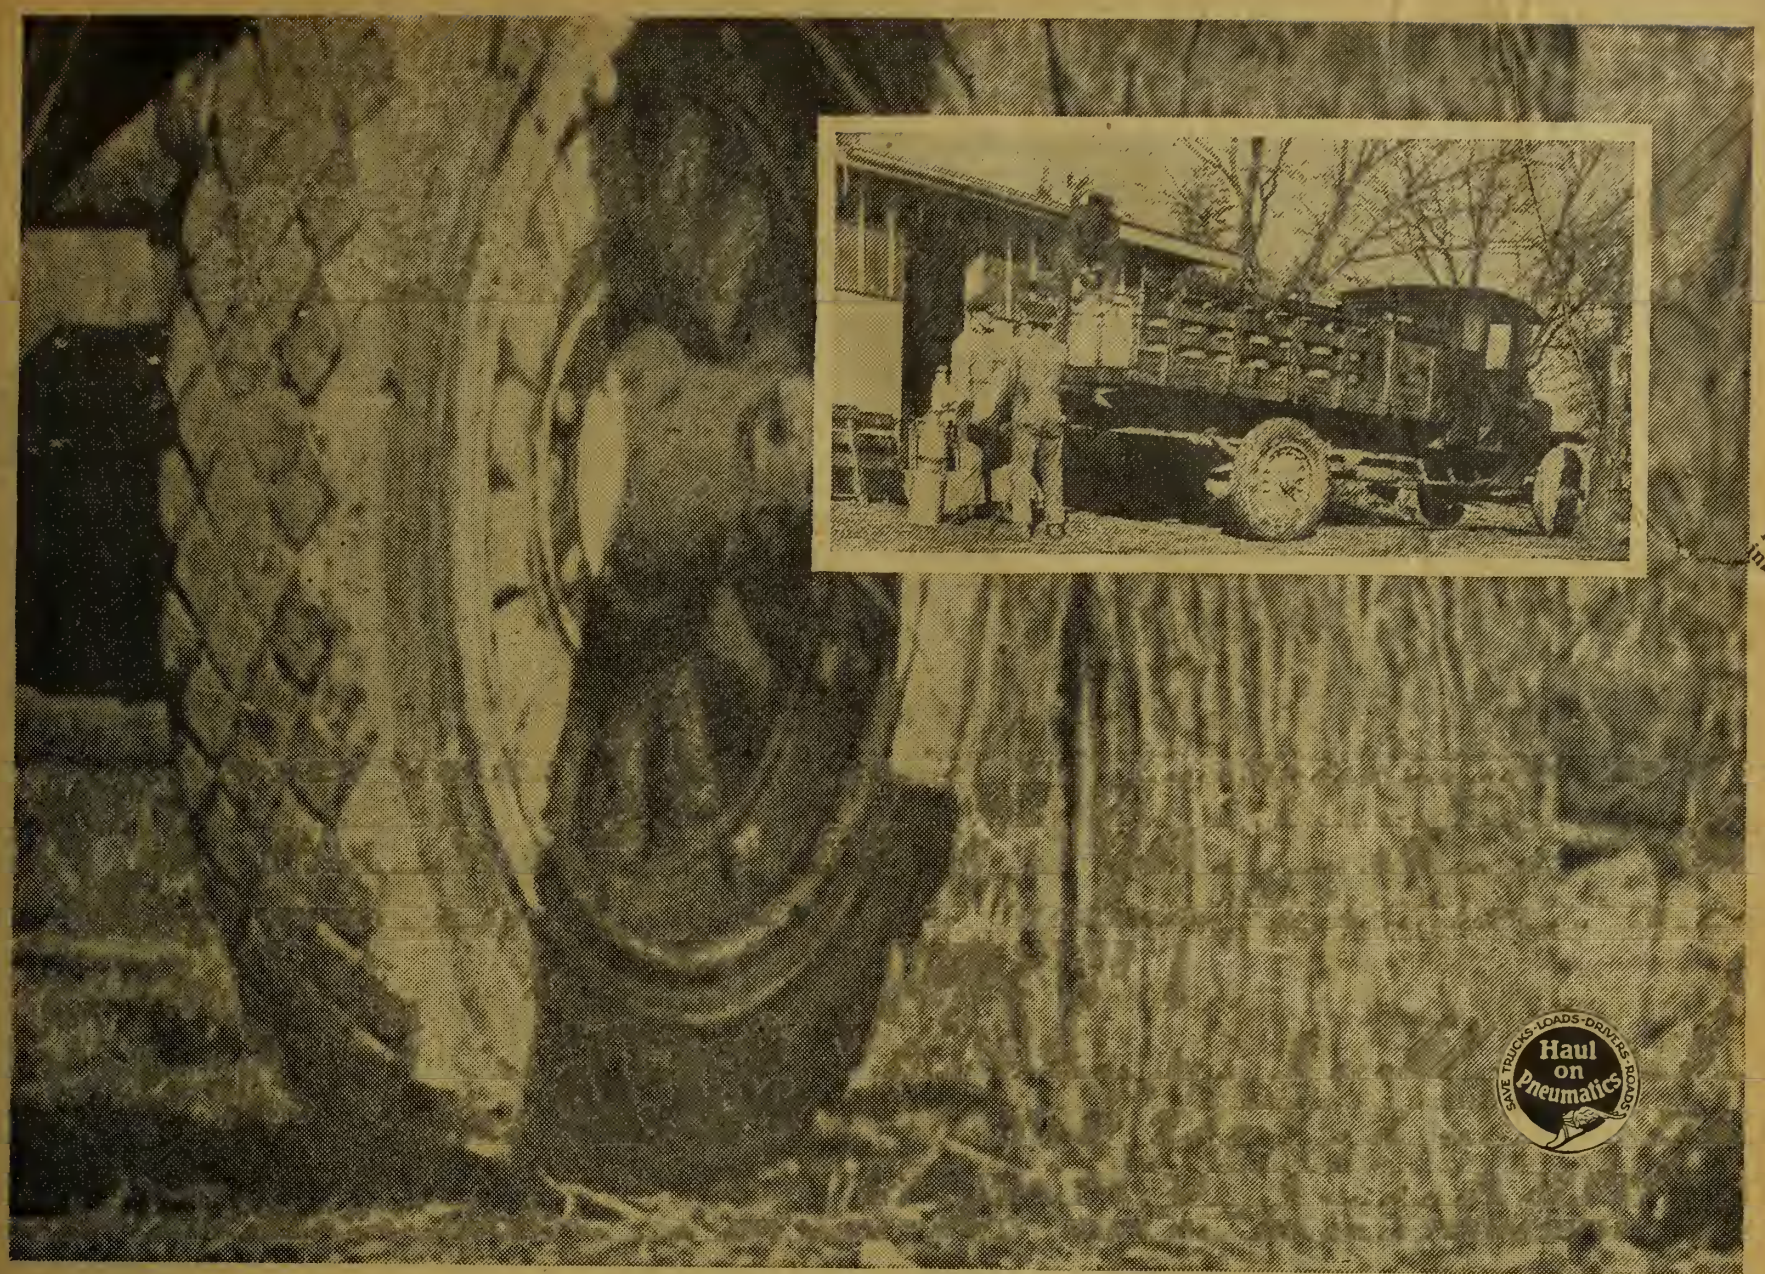
ROSTER OF GRANGE MEMBERS

We have received from Master F. L. Hunt of California State Grange roster of State, Pomona and Subordinate Granges of California. F. L. Hunt, Napa County, is master of California State Grange and the secretary is Mrs. Martha L. Gamble, Santa Rosa, Sonoma County. There are Pomona Granges located in Sacramento, Santa Clara, Siskiyou, Sonoma and Tulare Counties. Subordinate Granges are located: American River at Fair Oaks, Antelope, Aromas, Bellevue at Santa Rosa, Bennett Valley at Santa Rosa, Big Springs at Montague, Capital at Sacramento, Castoria at French Camp, Danville, Dinuba, Edgewood, Elk Grove, Elkhorn at Watsonville, Forestville, Fort Romie at Soledad, Gazelie, Geyserville, Gold Hill at Newcastle, Greenfield, Greenhorn at Yreka, Guenoc at Middletown, Lincoln at Cupertino, Live Oak, Kelseyville, Mountain View, Napa, Oakland, Orangevale at Folsom, Orchard City at Los Gatos, Petaluma, Poplar at Porterville, Potter Valley, Redwood at Calpella, Rutherford, St. Helena, Sacramento, San Jose, Santa Rosa, Scott Valley at Fort Jones, Sebastopol, Silverado at Calistoga, Strawberry Valley at Sisson, Tulare, Two Rock at Petaluma, Valley Oaks at Galt, Visalia.

The manufacture of brushes consumes about 13 million feet of wood annually. There are 30 species used Half of this is beech while birch and maple supply about 15 per cent each

Eight million feet of lumber is used annually in the manufacture of clocks



Copyright 1920, by The Goodyear Tire & Rubber Co.

"MY truck on Goodyear Cord Tires is the most useful piece of equipment on my farm, which I am motorizing quite thoroughly. Motorizing reduces farm costs, increases income. With a pneumatic-tired truck, the farmer can get the most work out of his other power-driven machinery because he can handle the loads fast enough in and out of the machines—also fuel, lubricating oil and other supplies."—Henry Ott, Farmer, O'Bannon, Kentucky

AS THE experience stated above makes clear, farmers find that pneumatic truck tires remove the handicap that slow hauling places on the operation of power-driven farm machinery.

They have demonstrated that trucks on Goodyear Cord Tires haul fast enough to prevent shut-downs, with the consequent loss in labor cost, when ensilage is being cut, feed ground and grain threshed.

In carrying loads to and from the machines, Goodyear Cord Tires hurry through soft fields where horses must pull hard and tediously and where solid tires are stalled by their lack of traction.

The all-round ability of Goodyear Cord Tires also means that fuel, water and additional supplies can be transported to tractors and other machines, and that a truck is available for many such chores between its more regular hauling trips.

This efficiency of the perfected pneumatic truck tire rests on its traction, cushioning and activity, and these advantages, in turn, are made entirely practical for farm work by the stamina of Goodyear Cord construction.

The results it thus makes possible in farm and related rural hauling are described in detail by many users' reports which can be obtained by writing to The Goodyear Tire & Rubber Company, at Akron, Ohio.

GOODYEAR CORD TIRES

Application of Manures

From Address by A. D. Shamel at Citrus Institute, San Bernardino

UP to a few years ago the broadcast system was generally used in applying manures in California citrus orchards. Under Eastern conditions for many of the general farm crops this is without much doubt the most practicable one to follow. In applying this method to California orchard conditions however there are certain fundamental defects which must be considered.

Most generally distributed in California citrus orchards during spring, summer and fall. During the winter or rainy season it is practically impossible to haul the manures into the orchards without danger of injuring the physical condition of the soil. When the manures are applied during the spring, summer and fall they are spread out in thin layers over the surface and usually allowed to remain of necessity in this condition for some time, frequently as much as two or three weeks, before they are plowed under or covered in some way. During this period of exposure when the thin layers of manure are subject to the intense rays of the sun, the wind and other weather conditions, there is no question but that very great losses of the plant food constituents of the manure occur. Some studies along this line have indicated that during a two weeks' exposure the manure spread on orchard soils frequently loses as much as 75 per cent of its nitrogen content. When we consider the fact that the nitrogen is probably the most important constituent of manure, this loss is appalling.

Pit Method

Another method which has been used to a very limited extent in some orchards under my observation has been the so called pit method. With the pit method holes are dug between the trees in the tree rows under the trees or near the trees. These holes are usually from 16 to 24 inches in depth. After they have been dug, which of necessity has to be done by hand labor, they are filled partly or completely full of manure, after which some of the soil taken out of the pit is thrown over the top of the manure in the pits. I have had the opportunity of studying the condition of the manure in these pits for several years subsequent to its application and of observing the apparent results of the use of this method upon citrus tree conditions. I am of the opinion that much benefit has been derived thtrough this method of applying manure to citrus orchard soils and that under certain limited conditions it is probably economical to use this method. On the other hand the cost of digging the pits is almost prohibitive, especially under present labor conditions. The decomposition of the manure in the pits studied apparently took place very slowly. Furthermore, it seems probable that the beneficial results of this method of applying manure cover a longer period than observed in the use of any other method. However, in some cases disappointing results have obtained from the use of this method. So far as I have been able to study the causes of such conditions I believe that the difficulty in these instances has been due to the fact that the irrigation water did not penetrate to the manure pits and that the manure in these pits frequently became dry for long periods, in this way nullifying to a considerable extent the beneficial results of the active fibrous root development which took place in the decomposed portions of the manure in the pits during favorable conditions.

Furrow-Manure System

The third method of applying manure, which I have called the furrow-manure system, is now being extensively used in commercial citrus orchards in Southern California. It seems probable that it is now the most generally used of all systems of applying manure in citrus orchards and that it is destined to become the almost universal method of distributing manure for the improvement of citrus orchard soil conditions.

I have described this method frequently. However, considerable progress has been made during the past year, particularly along the lines of the machinery needed in the use of this method so that I feel warranted in discussing it again in some detail. The furrow-manure system provides for the distributing of the manures, including all organic fertilizers and possibly some inorganic fertilizers, in citrus orchards in furrows alongside or near citrus trees. We believe these furrows should be made from six to eight inches deep when made near the drip of the branches of the trees. When the furrows are plowed near the middles of the tree rows they can be made deeper. I believe, however, that in no case should these furrows be plowed out deeper than ten inches.

Making the Furrows

These furrows can be made with an ordinary walking plow or other plows. However, during the past year special plows adapted for this purpose have been put on the market which are in many ways an improvement upon the ordinary plow. Several of the larger citrus growers are using ordinary subsoil plows which they have equipped with middle buster shares in such a way as to make satisfactory manure furrows.

The arrangement of the furrows in the orchards will depend upon many circumstances, including method of planting, condition of soil and the lay of land. No general statement can be made at this time as to any one method which should be followed in all cases. Experience is demonstrating, however, that so far as practicable these furrows should be made as a rule, particularly during the first few applications, somewhere near the drip of the branches of the trees. It seems probable that the position of the furrows should be changed somewhat from year to year although this question is one which has not been fully settled as yet.

The position of the furrows should be arranged with the following considerations in mind: So that the manure in the furrows can be kept moist regularly throughout the irrigation season; so that the irrigation water be run alongside of the manure furrows and not over the tops as has been done in some cases during the past. I have made enough observations to show conclusively to my satisfaction that when the irrigation furrows are made directly over the manure in the furrows and the water run directly over the manure the results are not as satisfactory as when the water is carried in irrigation furrows alongside of the manure furrows.

Saving in Manure

The amount of manure to be used in the manure furrows varies with so many conditions that it is impossible to offer any statement as to definite amounts of manure for application in the furrows. As a general rule I believe that one-half the quantity of manure ordinarily broadcasted in the orchard will be sufficient for use in the manure furrows. When only a small quantity of manure is available or when other conditions warrant, as in the case of young trees or those planted widely apart, it seems probable that the best plan is to distribute the manure in the furrows alongside the trees in a space which corresponds approximately with the spread of the branches of the trees. It seems probable that the bunching of the manure in these spaces is preferable to stringing it out in small quantities the entire length of the furrows when only

Mitchell Sets New Style

to add to dependability and economy

The new Mitchell development — now that factory efficiency and mechanical design have reached a high state of perfection — is a distinct advance in style.

Thus the Mitchell organization brings to motoring America the utmost in a medium priced car, a car whose values cannot be equaled.

The chief attainments in this new Mitchell are the harmonizing of lines, such as presenting the radiator at a slight angle conforming with windshield, doors and other lines of motion. This brings an innovation that was bound to come sooner or later, just as the straight-up-and-down windshield had to give way to today's slant.

Other betterments include the wonderful finish of the body, the attention to minute details. We venture to assert that you can find no car of like price with such improvements.

As for the chassis, we include all the experience of these years of fine car building, adding many improvements and refinements. Increased factory efficiency and finer materials also give this new Mitchell new values which appeal to thinking buyers.

We have concerned ourselves, too, with added beauty, greater comfort, more room. The result is a superfine car at a modest price.

And all this is possible by the factory efficiency in our great plant, by building the Mitchell complete, including the bodies, and by nation-wide distribution. Thus we save for you and at the same time give multiplied value. We advise your response without delay. Go see the new Mitchell at once. Note its beauty. Ride in it. Then place your order at once, so as to bring earlier delivery.

Why 50,000 Dealers Sell Goodrich Tires

"The other day I signed up your, or should I say 'our' 1920 agreement, and it occurred to me that you would be interested in my reason for arranging to handle Goodrich on a much larger scale than last year.

"It is this: I was recently asked why I handled Goodrich tires practically to the exclusion of all others, and my answer was;

"Because I have not had a Goodrich tire come back, and because I believe they are the best proposition on the market today."

Very sincerely yours,
John E. Dennis.
3083 Main Street, Buffalo, N.Y."

IT IS THIS FAITH in Goodrich Tires, Goodrich methods, and Goodrich help, that has caused more than 50,000 dealers to feature Goodrich Tires.

John E. Dennis says, "*I have not had a Goodrich Tire come back.*"

If a *tire had* come back, he knew from Goodrich's clear statement of certified service that his customer had full protection in the Definite Adjustment Basis—6000 miles for Fabric Tires and 8000 miles for Silvertown Cords.

The nation-wide demand for Goodrich Tires is proof positive of the soundness and fairness of the Goodrich merchandising policy.

But more important, the economic right of this policy, and the outspoken, open-handed declaration of it, have put the purchase of a tire on a firmer foundation for dealer and user.

Silvertown Cords, 8000 Miles

Goodrich Tires

limited quantities are available for distribution.

Covering

Most citrus orchardists have been able to arrange their work in this respect so that the manure distributed each day in the furrows is covered the same day it is distributed. Various methods of covering are in use. The most common is by plowing the soil back over the manure by means of the ordinary mold board plow. It seems logical and practicable that it is extremely important to cover the manure in the furrows as soon as possible after it has been distributed in order to conserve the plant food. Some users of this method have adopted implements especially designed for this purpose which simplify and probably reduce the expense of covering the manure in the furrows. These implements include drags so arranged as to pull the dirt back onto the manure from both sides of the furrow at the same time. Another method is to use a machine primarily designed for ridging the soil as for example making celery ridges. This method is carried out by the use of implements which are similar to disk cultivators or to large shovel cultivators.

Best Season

The season best adapted for the application of the furrow-manure method is a question which is frequently raised but one again concerning which no general rule can be laid down. On some citrus ranches in Southern California manure is applied in furrows practically every month. This is necessary because practically the entire year is required to go over the orchards. The availability of manure also enters into this question as it is frequently impossible to secure it at a particular time. Other factors are involved, including labor conditions, which make the time or season of the application of the manure one which must be determined by local conditions. Other things being equal, my opinion is that the manure should be distributed in the furrows if possible during the spring and summer or early fall. In any event it seems desirable that the furrows should be made, filled and covered in these orchards where cover crops are grown before the cover crop seed is sown.

The added experience of the past year in the results of the use of the furrow-manure system have shown it to be an economical method of applying manure, more economical and practicable at the present time than is the broadcast, the pit, or other systems of applying manure in citrus orchards in Southern California. The vigorous growth of the fibrous roots of the citrus trees in the buried manure in the furrows and the corresponding tree and fruit conditions which have universally followed the intelligent use of this system have demonstrated beyond any reasonable question of a doubt its commercial value.

The reason for the beneficial results

USL
STORAGE BATTERY
SERVICE
All our repairs - on any make of battery - are guaranteed for 8 months
USL
NIAGARA FALLS TYPE HDN-311-X

Is that good old battery of yours getting balky?

IT may require only a skillful repair to bring back its snappy motor-spinning power. No matter what make of battery you have in your car, drive to your nearest USL Station for Golden Rule Service.

USL Service Stations don't have to sell a fixed number of batteries each month, that's not the USL Policy. Often when a man thinks his battery is done for and wants to buy a new USL, our Service Stations show him how they can save money for him by repairing his battery and giving him an adjustment guarantee for eight months. That is "Golden Rule" service.

USL Service Stations are expert at keeping *electrical systems* in tune so they will treat the batteries *right*. It is important to remember this.

USL Service Stations sell only the USL Battery which has long life Machine-Pasted Plates. USL Batteries are shipped "Dry-Charged." This avoids all before-sale deterioration and the customer is assured a perfect battery with every bit of its life intact.

If you are having trouble with your automobile battery or your farm lighting battery, be sure to see the USL Service Station Man and have the trouble corrected at once.

The USL Farm Lighting Storage Battery

U.S.Light & Heat Corporation, Niagara Falls, N.Y.

Likely there's one of our fifteen hundred service stations in your town. If there isn't, for the address of the handiest, just drop a post card to the nearest of the following distributors:

Sunset Electric Co., Seattle, Wash.
Sunset Electric Co., Portland, Ore.
Automotive Service Agency or Earl D. Waldoone, San Francisco, Cal.
Electric Equipment Co., Los Angeles.

Cling Peaches $137.00

That is what some growers received who delivered their fruit to this big company which they own themselves.

The average price for all grades Number 1's, Number 2's and culls, was $117.00.

These growers expect even better prices for the season of 1920. If you are interested and want more information, write to the

DAYS OF GRACE

(Continued from Cover Page.)

However, from this figure may be deducted two to five per cent depreciation on farm buildings, five to six per cent depreciation on farm fences, 10 per cent depreciation on farm machinery, 15 to 20 per cent depreciation on tractors and farm autos.

The allowable deductions on account of being married, caring for dependents, etc., and in addition the total amount paid to church, charitable, educational, and scientific institutions provided the amount does not exceed 15 per cent of the net income.

But there are thousands of questions which will come up in the process of making out these reports. At least, there are 122 of them which the revenue collectors have already recognized and given answers to in "Income Tax Primer for Farmers." A copy of this primer may be had at every collector's office, or if not, and our subscribers will write and send two cent stamp, the Cultivator will send copy by return mail. This is a 32-page booklet and will prove of wonderful help. Here, for instance, are Questions 1, 2 and 3, with their answers:

1. Who is a farmer?
   The term "farmer" as used in this primer embraces persons operating stock, dairy, poultry, fruit, or truck farms, plantations, ranches, or any land used for fruit raising or agricultural purposes.
2. I am a farmer. Am I required to made a personal income tax return for 1919?
   Yes; if your total net income for the taxable year was $1,000 or over, unless you were married and living with your husband or wife on the last day of your taxable year, in which case you should file a return in the event your total net income equaled or exceeded $2,000.
3. To what personal exemptions am I entitled?
   If on the last day of your taxable year you were a single person you are entitled to an exemption of $1,000; if you were married and living with your wife or husband, or were the head of a family, you are entitled to an exemption of $2,000. You are also entitled to a further exemption, whether single or married or the head of a family, of $200 for each person (other than husband or wife) dependent upon and receiving his chief support from you, if such dependent person is under 18 years of age, or, regardless of age, if incapable of self-support because mentally or physically defective.

PLANT TREES NOW

These Copious Showers Spell Tree Insurance

For your convenience we give herein our stock list of this date. While many varieties are sold out, you will note the assortment of the best sorts is still fairly complete. Any tree you plant now will grow. Trees are all in first-class shape—for hardiness, good roots and freedom from disease Silva-Bergtholdt foothill-grown trees have no equal. Note prices quoted, likewise the number in each variety and size available for your planting.

When It Comes to a Real "Show-Down"

PATRIOT

Farm Motor Trucks "Go Through"

On paved highways, no truck gives more satisfactory and economical service than the Patriot.

But if you want to see this unusual truck really perform—get right down and pull—send it charging through hub-deep mud, up slippery hills, through clogging sand, over newly plowed ground.

You will be astonished at the willing ease with which the Patriot answers unreasonable demands.

Built for the Farmer

Patriot Trucks were designed to stand up and deliver under the unusually difficult conditions that prevail on the farm. We expect the owner to use his Patriot every working day of the year, fine weather or foul, good roads or bad.

Patriots are easy to run and keep running. Few adjustments are necessary, little attention required.

Ask us to send you the new Patriot Catalog.

Think it over

If the seed you planted in good ground did not produce, would you plant that same kind of seed again?

Then why replace a broken porcelain plug with another porcelain plug?

The Splitdorf Spark Plug—break-proof and leak-proof—"The Plug with the Green Jacket"—has no porcelain to break to put it out of commission and make a new plug necessary.

East India Ruby Mica exclusively is used for insulation, and unlike porcelain it never chips, cracks or breaks.

There is a special type Splitdorf Green Jacket Spark Plug best suited for your engine—with the right Splitdorf Plug, once installed, you simply forget spark plug trouble.

Write for booklet that will show you the correct plug for *YOUR* engine.

More About Nematodes

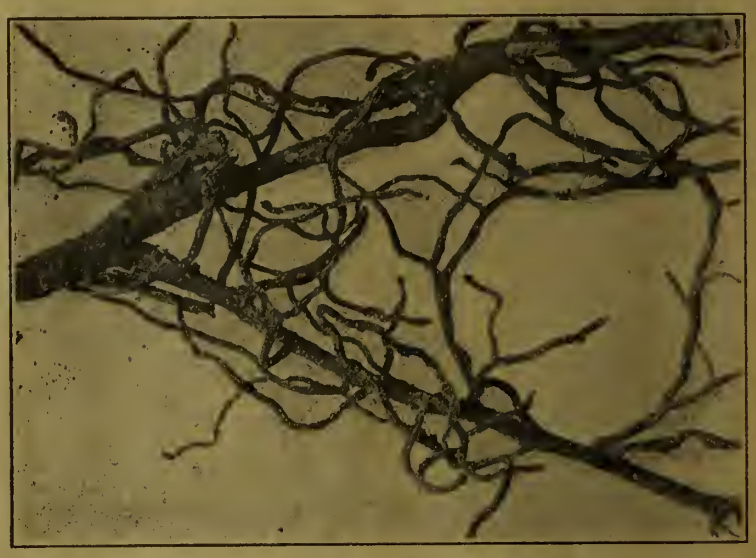
OUR last week's paper, with the warning as to the serious situation confronting California producers because of nematodes infesting much of our soil, was not yet off the press when the following communication from A. H. Bobo, Riverside, was received, giving even more emphatic warning of care needed not to further spread this pest. Mr. Bobo sends photos showing much the same condition illustrated in the engraving in our last issue, but his additional warning is certainly worth heeding.

Mr. Bobo writes:

"I have been watching and trying to find some relief from them for the past two years. Last summer they killed all my squash and pumpkins. Then in October I noticed they had commenced on my carrots, parsnips, salsify and rhubarb. In fact, most all vegetables to some extent, but they were worst at that time on carrots and rhubarb. They began work on a half acre of small white beans. I noticed them first in July, 1919, on 20 rows 310 feet long. I irrigated through redwood flume, and I noticed them first next to flume where beans were just beginning to bloom, and by September their work had reached about 200 feet down each row. Here I practically did not harvest any beans, but from the other 110 feet I received 135 pounds of nice beans. The same way with seven rows of carrots, same length, which I never dug, until January 24, 1920, and the nematodes had fully covered every row. Next to the carrots I had growing Irish potatoes, two rows, which I planted the second day of February, 1919. I plowed them up July 1 and they were all affected except about 50 pounds. Next to the potatoes were two rows of rhubarb planted in February, 1918, which has very few nematodes on it at this writing. These I had bought from a neighbor. They were examined on February 17, 1920, by Prof. Sharp of Riverside and Prof. W. V. Shear of Sacramento, who happened to be in Riverside in the interest of the potato industry. I also had two more rows of rhubarb of the same length which I had bought from a man living near Los Angeles. They had practically died, so I plowed them up the first of January, 1920, and found them badly affected.

"I wish also to state that on February 12 I was in San Bernardino and happened to see a large truck unloading vegetables at a grocery store, and the first thing I noticed was a box of parsnips with enough nematodes on them, if retailed by the bunch, to stock every backyard or garden in San Bernardino. That aroused my ire, and as I had a little time I passed in front of four more grocery stores and found lug after lug of parsnips, carrots and salsify, literally covered and alive with them. Then the next day and every day since that I have been in Riverside I have watched and found the same trucks unloading to nearly all the stores the same kind of stuff.

"I hope this will open the eyes of those who can stop the spread of this dreadful pest and try to find a remedy."



Root Knot on Orange Caused by Nematodes

"Methods of Marketing Vegetables in California" by Stanley S. Rogers is the title of Circular 217 issued by the agricultural experiment station of the University of California. It touches upon practically all methods of handling fresh vegetables; direct to consumer, through stores and hotels, selling in cariots and otherwise. It even touches upon plans for the garden and lists of California gardening crops. The larger vegetable producers will find it of value.

Strawberry Roots Infested With Nematodes

General Motors Trucks

Plenty of Work for a Truck

There is plenty of work on a farm for a motor truck besides just hauling produce, grain or live stock to market. And once you have a truck ready for any job, you will wonder how you ever got along without it.

There is no question about the utility of a dependable motor truck on any farm.

The important thing is to select the dependable truck.

Do not make the mistake of thinking that because you do not need a truck for hard usage every hour of the day, you will save money by buying a cheap truck.

No good farmer thinks of buying a poorly constructed plow or planter simply because he does not use it all season.

When you use a truck, you want the assurance that you are going to get to your destination and back again.

You want a truck that is dependable under all conditions; one that will give satisfactory service and will not be in the repair shop when needed for work.

GMC trucks are reliable, durable and moderate in price. They are made in all capacities from ¾ ton to 5 tons.

If you will tell us your trucking problem, we can help you select the right truck for your service.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THE RAIN

"It isn't raining rain to me; it's raining daffodils"—even cabbage heads. At least it so appeared from the size of the drops as the rains came down this week. And they have reached from far north of Shasta to Mexico, though the extreme North does not yet seem to have struck its natural rainy day gait. The native grasses are now nearly knee high and hay and grains are working overtime. The mountains can still take a bit more snow, but it is going to be a wonderful year.

SUPPORTING THE RAILROADS

Farmers are surely enthusiastic and loyal supporters of transportation. This may not be because of patriotism when the government was in control nor because of love when private interests are in control—perhaps because they don't plan ahead. They dig their potatoes, take them to market, and before the next crop are paying three or four prices and buying them back in two-bit packages while waiting for the next crop. Their wheat goes to market; their flour comes in over the same railroad. Five dollars worth of wool is sent to Boston; it comes back in the form of a suit of clothes, but somewhat reduced in weight, and the same farmer that grew it pays $75 for it—possibly, if he is easy, $100.

Now comes the hay producer to the city and pays the hay speculator $41 per ton—and in addition various commissions, cartages, etc.—for hay which he sold a few months ago for $15, $16 or $17. This shows a warm interest in the welfare of the stockholder of the railway. Many of his dividends are made possible because of this double haul.

To be sure, the drouth came and the farmer's calculations were somewhat upset, but something is likely to come every year, and if it's fair to repeat a former suggestion—"Let's have a head and use it."

HIGH COST OF FARMING

A reviewer of markets recently asserted that "Six years ago today eggs were selling at a slightly higher figure than today," in fact, two cents more, according to market reports given in the California Cultivator. At the same time in 1914 California Club wheat was quoted at $1.52½ per cental; good Eastern corn, $1.70; barley, $1.30; Gyp corn, $1.65. In 1920 wheat, mixed feed, (not California Club by any means), $5.20 up; Gyp, $3.55; corn yellow, $3.38-$343; barley, $3.60.

Yet to be popular today we have to say that the poultryman is a profiteer.

FORM 1040-A

The nightmare will soon be over, except in memory, or ratber, there will be a for-sure nightmare if we do not end the making out of our individual returns prior to March 15. The whole worrysome, exasperating, maddening bunch of questions from "1 Did you make return for 1918?" down to "L. Total net income" has caused a great scratching of the bald spot on top and a wondering as to how many years we will go up for if we fail to get exactly correct all the items under "A," "B," "C" and on down to "H"——"L."

Most of us are now ready to turn over to the department of the interior one-half, or even all, of that "total net income" if the department will only make out our report for us.

ROADS ARE OPEN

Trucking companies, stage lines, and, in fact, all motor users, are appealing for early opening of the roads in some sections of the East. Business men of Albany, New York, recently gathered and discussed the blocked motor traffic situation. Now they are extending their movement to neighboring cities and even urging the state legislature to appropriate sufficient funds to "keep principal highways open to traffic the year around."

California has made no extensive investigations along this line, but out here we have been succeeding very well in so fully occupying the landscape with golden poppies that there is no room for snow banks.

12 DOLLARS A DAY

The appeal to avert impending disaster by less lavish spending comes with little force to most of us; the necessities of the case impel to greater economy. This is true, we believe, of the great majority in towns, and certainly in rural communities. Notwithstanding this, the windows of the larger shops and the crowds at the counters which are not bargain counters, indicate that some are buying and buying heaviiy. This may be explained by the fact that free spenders are securing long wages these days. We know of one job—doubtless there are many others—where bricklayers are being paid $12 for eight hours work. They begin promptly on time; they stop equally as promptly. This has caused many a farmer boy to leave the farm for the longer wages of the city, and is resulting, or will result, in lessened production on the farm. There are today 17 per cent less hired men on farms in the state of New York than there were a year ago, and in addition it may be said that the number of people living on farms of that state is three per cent less than in February 1919. This means that in that one state there are 35,000 fewer men or boys engaged in farming. This is a more rapid movement from the farms than took place in the early part of the war.

When these boys become bricklayers at a dollar and a half an hour they become free buyers of the wheat and other things Dad is still producing on the old ranch. This liberal buying, together with large demands from foreign countries, is going to leave America short on food unless there is less exported or less consumed here.

CHEAP MONEY

The cheapest commodity these days is money—far higher in value in America than in any other section of the world, but still of little value as ordinarily used, that is, considered on the basis of its purchasing power. Its rental, or more correctly its interest, value seems to remain up. In fact, commercial centers report a "hardening" tendency.

Farming, like many industrial and commercial operations, calls for money in excess of that in hand of the farmer or the operator. Hence, credit. And credit is the biggest factor in modern day business. Rural credits have, however, never been on a satisfactory basis and rural development has suffered because of this lack.

For a score of years methods of improving rural credit conditions have been discussed. During Theodore Roosevelt's administration a commission was sent to Europe to investigate. It made its reports and much discussion followed. Still better, action resulted in the establishment of federal farm loan banks. The management of these banks has labored under the embarrassment of having absolutely no American precedent and has fully realized that it was pioneering and in danger of taking a step which might jeopardize the entire movement. Hence, caution has been the word, but notwithstanding this, in the short time these banks have been in operation they have closed 111,131 separate loans and turned over in cash to farm owners $296,386,496. This up to December 31, 1919. Our own Pacific Coast bank, the headquarters for District 11, has actually closed 4,988 loans and turned over to farm owners $15,713,200. One district bank, that at St. Paul, has made loans totaling over $39,000,000.

But these loans proving as beneficial as they are, also proves that there is need for still greater need for cheap money. For here are other figures to be considered in connection with those 100,000 loans already closed:

In addition to that 100,000, there have been approved, but not yet closed, some 20,000 other loans. Also, there have been 73,843 applications, involving $188,735,495, which have been rejected. These rejections, every ono of which probably meant as great need as those which were approved, are still in the market for cheap money. This to say nothing of the great number of farmers who are unable to give the required real estate security, but who could use beneficially to themselves and the country short time money.

A loyal supporter of the federal farm loan bank in San Diego County has taken us somewhat to task because of referring to effort on the part of the Commonwealth Club of San Francisco to gather a fund of information as to means of securing relief for this type of rural credit. We simply call the above facts to his attention and to the attention of others who are desiring larger and more complete rural development. More efficient labor and greater capacity of management must be supplemented by more capital, and at rates as favorable as are extended to those engaged in manufacturing and merchandising.

MUTUAL FIRE INSURANCE

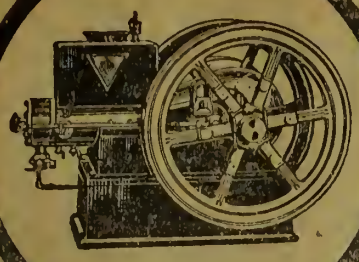
Farmers pay millions of dollars into the hands of large manipulators of the country's capital for protection against fire losses. Unlike life insurance, premiums paid on fire insurance are usually gone forever, that is, of all the buildings, crops or livestock which are insured, only an exceedingly small percentage is destroyed and recompense made by the insuring concern.

This money is transferred from the producing community to the large financial centers. If the farmer wishes it returned to aid him in his operations, a rate of interest, sometimes prohibitive, is charged. The question arises as to the wisdom of the producers of the country uniting and cooperating in protecting each other, and this gives opportunity to remark that that is exactly what is being done by large numbers of progressive producers.

This has been made possible in California by a special law which originally permitted only farmers in one county to unite in such an organization. Now, however, these mutual companies may extend their business beyond the county boundaries and even enter cities. There are certain restrictions, however, on them which do not apply to the larger old line companies. That is, they may not insure business property; they may not place more than $4,500 on property in any one city block. There are also severe restrictions in the matter of risks and in the maximum which they may place on rural property. While these restrictions sometimes prevent as large extension of activities as the directors desire, they are assurance of safety, and under them various mutual associations have sprung up in California, which have become profitable to the members. There are some 19 county mutual fire insurance companies in this state and considerably over 2,000 in the United States.

The largest losses these companies have had in this state in any one year aggregated but little over $100,000, but so far as we have heard every legitimate loss has been paid. The state of Wisconsin has made investigation as to insurance carried in that state by large corporations practically all located outside the boundaries of the state. It was found that four of these companies collected in net premiums $5,344,394 and paid out in losses $1,599,964. All told the stock corporations in that state collected from the people $38,913,017 more than they returned. This in a period of ten years.

If it can be so arranged that this money, less reasonable administrative expense, can be kept in the hands of the farmers and ultimately returned to their pockets, it looks like good business.



ALPHA Engines

All Sizes—for Kerosene or Gasoline

Here is a most efficient combination for pumping water for irrigation.

The Viking Pump driven by the reliable Alpha Engine will save you fuel and money every time you use it.

This saving will soon make up the difference in first cost between it and a "cheap outfit" and leave you with a dependable, durable pumping plant that will continue to save you money.

Investigate Alpha Engine and Viking Pump efficiency. Send for our engine and pump catalog.

JOHN H. REED

One of California's finest characters, a lover of trees, and a practical horticulturist, John H. Reed, died at his home in Riverside, February 26. Mr. Reed was the organizer of California's first horticultural club, was tree warden of Riverside for many years, and in every way encouraged the growing of forest and fruit trees. He not only organized horticultural clubs, but long after he was able to participate in fruit growers' meetings and institutes, he attended and encouraged so far as he could discussion and study of best of horticultural methods. To his initiative and effort is due largely the establishment of the citrus experiment station and the state school to be connected with the station, investigation as to decay in fruit shipments, plant breeding problems, etc.

We are indebted to the Riverside Press for the following sketch of his life:

John H. Reed was born in Rootstown township, Portage County, Ohio, in June of 1832, the son of Horace and Lois Reed. After finishing the common schools he attended Holbrook Normal at Lebanon, Ohio, and later he taught mathematics and languages in the same school. In 1858 he married Miss Catharine Morris and together they engaged in educational work for several years at Lebanon and Mansfield, Ohio. Growing deafness incapacitated Mr. Reed for school work and he transferred his attentions to the world of merchandising. Later failing health led him to California and in 1890 he settled in Riverside with his family, buying acreage which he set to orange and lemon trees.

Mr. Reed was truly the father of tree planting in Riverside and the beautiful shade trees lining the streets of the city are his most perfect monument.

VALUE OF FUMIGATION

In February, 1919, some labor trouble arose that halted the fumigation of the six acre orange grove of J. R. Abbot at San Gabriel just as one-half the trees had been treated. The trees are large seedlings a quarter century old and in prime condition. The remaining half was not fumigated until February of the present year. The crop on the six acres is estimated to be not less than 2,400 boxes and Mr. Abbot told the writer that at least two-thirds of the crop would come from the half that was fumigated last year. No precise record of this production can be kept, unfortunately, for the entire crop has been sold on the trees. These trees are large, 16 feet or more high, and the fumigation with liquid gas cost about $2.05 a tree. The crop sold on the trees for $2.50 a box, and if it is found to be at the minimum estimate of 2,400 boxes for the six acres, this will give a gross return of $1,000 an acre.—E. B.

The '49er says= "the genuine GIANT dates back to 1866"

"I remember well when we used black powder for stump blasting and mining. Just after the Civil War the first Giant Powder ever made in the United States was manufactured in a little laboratory in what is now Golden Gate park.

"Out of that beginning has grown The Giant Powder Co., Con., with its chain of great plants and magazine stocks throughout the entire West. And the Giant Farm Powders are being used for stump blasting, boulder blasting, tree planting, etc., by thousands of Western land owners. Giant Powders have always been so popular that some people have thought any ordinary dynamite was Giant Powder, but that is wrong. The only way to get Giant economy and efficiency is to get the genuine Giant Powders made by the originators of the name."

Just tell us "send me your book," and we will mail you our valuable guide to blasting. "Better Farming with Giant Farm Powders."

STUMPING GIANT FARM POWDERS EUREKA

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property.

Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops will bring good prices next year, so take advantage of this condition and get your land under cultivation now.

Write today, stating location of land and number of acres.

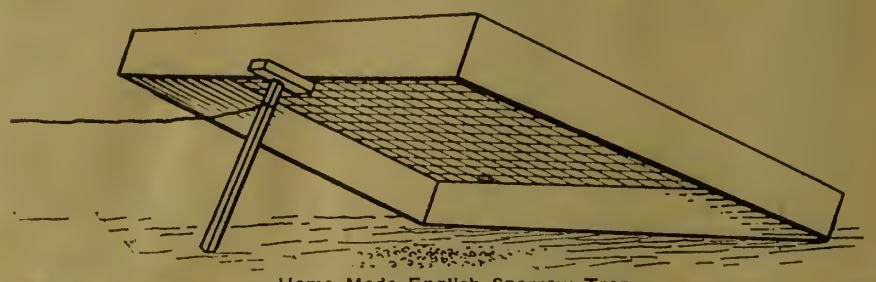
Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sparrow Pest

Will you please give me a method for getting rid of sparrows? The poisoned grain used for squirrels does not kill them. They eat more grain than my chickens and destroy garden plants. —Subscriber, Paso Robles.

The English sparrow is a serious pest in some sections of California as well as every other state of the Union. It has been characterized as equally as serious a pest as the rat. It not only steals the feed intended for poultry but destroys fruits and buds of flowers of practically all cultivated trees and shrubs. Unfortunately its control is not easy. A general fund of information has been given by the United States department of agriculture, Washington, D. C., in Bulletin No. 383, "How to Destroy English Sparrow" and Bulletin No. 493, "English Sparrow as a Pest." These may be had, if still in print, by dropping a post card to the department. A larger and more complete publication, Bulletin No. 1, "The English Sparrow," was issued many years ago, in fact in 1889, by the division of economic ornithology and mammalogy, United States department of agriculture. Without question this bulletin is out of print by this time. The best method of procedure is first to destroy their nests during the breeding season. Where they have formed the habit of gathering in large numbers on the poultry feeding ground the poultry may be corralled and hundreds of the sparrows may be killed by the use of a shot gun with fine shot. If the grain is scattered in a long narrow line the birds will gather along this line and a gun held very low will sometimes gather in large number of them at a single shot. Another way is to place the bait on a horizontal platform or board in the poultry yard at an elevation such that one with a shot gun may pick off numbers of them at a time. Captured in this way the pest may be made to reduce the H. C. of L. somewhat for they are excellent food. Trapping is also followed successfully by some. A screen frame at least four feet square, preferably much larger, may be arranged as shown in engraving. After a few days of feeding under this screen and the sparrows have learned to gather in large numbers the cord is given a quick pull and the birds are trapped and may then be destroyed. As a rule poisoning is not satisfactory. The lives of fowls and even of members of the family may be endangered. If poison is used wheat is the best. Here is a formula which it is declared will cause the death of the sparrow if from two to six grains are eaten. The capacity of a sparrow's crop is about 30 kernels of wheat. Add ⅛ ounce strychnia sulphate to ¾ of a gill of hot water, boil until dissolved Moisten 1½ teaspoons starch with few drops cold water, add to the poison solution, then heat till the solution thickens. Pour this hot poison starch over one quart of wheat and stir until every kernel is coated. Use the poorer grade of wheat because the kernels are smaller and more easily eaten by the sparrows. Spread this poisoned grain thinly on hard flat surface to dry. When thoroughly dry it may be placed in fruit jars. Washing in very hot water will free these jars of any possibility of poisoning. Spread out a small quantity only at a time because if this poison grain is exposed to moisture it soon loses its virulence. For safety to poultry a heavy rain or the feeding ground thoroughly washed under pressure of hose removes danger. It must be borne in mind that beneficial birds are killed as well as the pest and poisoning should be used only as a last resort.



Home Made English Sparrow Trap

The MOLINE Tractor is Universal

It is THE ONLY FARM POWER-PLANT

Combining

Exclusive Features with Indispensable Results

1. Does all field work, including cultivating, harvesting and belt work	*Means*	No duplication by horses
2. One man completely operates both tractor and all implements	*Means*	A large saving in labor
3. A single seat in the center of all controls of tractor and implement	*Means*	Great ease of operation
4. A single unit of operation—the tractor and implements form but one unit	*Means*	Can back and turn short
5. Operator sees all his work—"Foresight is better than hind sight"	*Means*	Better and faster work
6. Tractive power in front of the work with operator behind the work	*Means*	Power used as horses are used

UTILITY IS NOT SACRIFICED FOR PRICE

The Power of a Correct Principle

The principle of doing all field operations with one man sitting where he can watch his work is correct, or farming has always been done backward, and the operator would always have ridden or led his horses instead of driving them.

The Moline Universal Tractor places the power of nine big horses where the horses stood—is driven just like horses are driven, from the seat of the implement, and hitched up to the implements just like horses are hitched.

NOTE—If desired you can use the "drag behind" or horse drawn implements you now have with the Moline Universal the same as with other types of tractors.

See your Moline Dealer or write our nearest branch for full information

Sulphur on Citrus Trees

Is the dry dust spraying with lime-sulphur and other chemicals effective on citrus trees?—Subscriber.

I suppose our subscriber wishes to know as to red spider control, and we may say that the dry lime-sulphur treatment has been used to a large extent. We believe the greater number of present day treatments are given with simply the high grade flowers of sulphur alone. See article by Mr. Davis in issue of August 9, 1919, page 144; also article by Prof. Quayle in issue of February 7, 1920, page 198.

Thornless Blackberry

I notice that on my one year old Cory Thornless blackberry vines there is here and there a lateral shoot that is thorny just like the regular thorny stock. Is there any probability that the whole vine will eventually revert back to the old thorny type?—Subscriber.

This is hardly probable. However, we have learned so much within the past few years regarding bud variation that we will be glad to hear from subscribers who have made observations along this particular line.

California Wonder Corn

The result of ten years' selection. Produces six times as much as common corn. First prize winner at San Francisco Land Show. Quick and big returns from a small investment. All seed produced from corn bearing 5 to 12 ears per stalk. Grows 10 to 16 feet in height, producing enormous crops of very rich ensilage. Choice selected seed for sale at reasonable prices, shelled, on the ear and stalks with all the ears on them. Our illustrated booklet, giving full history and details of this wonderful money-maker, sent free on request.

Anaheim Disease—Phyloxera

Is the Anaheim disease in grape vines the same as phyloxera?—Subscriber, Los Angeles.

No, these are two entirely different troubles. Phyloxera is a minute insect or plant louse infesting the roots and sapping the vitality of the vine. Some American varieties of vines are practically immune to attacks of the pest, but introduced European varieties are greatly injured and even killed by it. Anaheim disease, a California vine disease, is another question. If any vineyardist can inform us as to just what it is and give a cure for it he will go to the head of the class or have a monument erected in his memory. There have been many bulletins published on this trouble. One of the first of these was Builetin No. 2, "The California Vine Disease," by Newton B. Pierce, issued by the division of vegetable pathology, United States department of agriculture, Washington, D. C. This is a 220 page book. There is no known cure for this disease.

Literature on Pheasants

In addition to information given in answer to query under above head last week: Bulletin No. 1, "Pheasant Raising," issued by state board fish and game commissioners, Sacramento; also Farmers Bulletin No. 197, "Importation of Game Birds and Eggs for Propagation," issued by United States department of agriculture, Washington, D. C.

Tansy Mustard

I am sending under separate cover a weed which seems to be getting a good headway in my alfalfa and I believe it came with the seed. I wish to know if it is harmful and what it is.—Subscriber, Lucerne Valley.

This plant is doubtless Sisymbrium pinnatum, the tansy mustard, a rather common weed, especially in interior valleys, being frequent from the south to the upper ends of the San Joaquin Valley. It is no more harmful than other members of the mustard, nor is it of great feeding value and merely is an undesirable weed.

Pollenizing Corn and Milo

Would like to know if kafir corn or milo will intermix with field corn or popcorn if planted near together. Would it be all right to plant the kafir between a feld of corn and a field of popcorn on a ranch of seven acres?—Subscriber, Puente.

There have been freaks which confounded the scientists and things have happened which "couldn't." However, it is probably a safe proposition to plant a strip of milo or kafir or any of the sorghums between the two varieties of corn. If the strip is wide enough it is probable that the corn and the popcorn would not mix, and, as noted, there should be no effect from close planting of any of the sorghums.

Gasoline for Killing Squirrels

As I have read your paper for a number of years and have never seen anything about using gasoline for killing squirrels, I thought you would like to know about it. We have used it with good success. It can be used the same as carbon bisulphide. We wet a ball of old burlap and put down the hole, then close it up tight. It is so much cheaper than carbon bisulphide and easier to get that I should think there are lots of farmers who would use it if they knew.—A Subscriber, Orange.

Pumping Difficulties

We made a well for a neighbor, ten

FIRST IN FAVOR

IT is significant that Ajax Cord Tires have won such marked popularity among men who give their cars hard usage.

Yet it is most logical, for two special Ajax features—Shoulders of Strength and the Cleated Tread—give Ajax Cord Tires exceptional resistance to wear. Shoulders of Strength brace the tread, and re-inforce it. Those thick sturdy cleats hold—just like the cleats on an athlete's shoes.

Ajax Cord Tires, Ajax Road King (fabric) Tires, Ajax Inner Tubes and Ajax H. Q. (High Quality) Tire Accessories are sold at the nearest Ajax Sales and Service Depot.

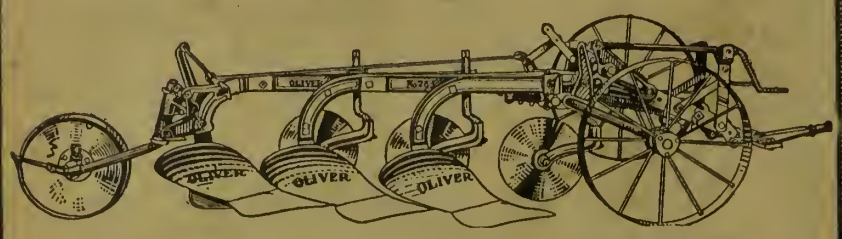
Oliver's New Orchard and Vineyard Tractor Plow



Three or Four Bottom, 10 Inch Cut—Chilled or Steel.

This remarkable plow marks a progressive step in plow making. It is something new, with radical improvements in design and material.

It is far in advance of any other gang on the market and challenges the admiration of the public.

It provides the necessary adjustability for plowing to and from the row and is innocent of any "fruit picking" levers. It is leverless, low, automatic and happily devised to meet the difficulties of orchard and vineyard plowing in every way.

Beams, Axles and Braces are of heat treated steel for extraordinary strength and rigidity.

Altogether a marvel and already far in the lead. Sooner or later it will be copied, but never improved by its imitators.

Descriptive literature on application.

Oliver Chilled Plow Works

"At Your Service"

Los Angeles San Francisco

When Writing Advertisers, Mention the Cultivator.

inch casing 46 or 48 feet to landing, depth 88 feet. Seemed to be plenty of water sand. Pit dug about 12 feet, put in four inch pump and six horse Fairbanks-Morse Z engine, 32 feet suction pipe. It makes the engine work as hard as it can, lowers the water in well to 23 feet from top of casing, but never pumped much sand and does not get much water. Is there power enough, and would a larger engine give more water? — Subscriber, Kerman.

The data given is not sufficient to determine where the trouble lies. We presume a centrifugal pump is being used and, if so, a good pump should lift 325 gallons per minute with a six-horse engine in good working condition, the total lift and suction being 35 feet, as stated. If the pump is doing this it is all that can be expected with the present power.—J. B. N.

Keeping Seed Potatoes

Will you please tell me how to keep seed potatoes from sprouting too early?—Subscriber, Solvang.

Cold storage at 38 degrees is the best method of keeping the seed, or if stored in cool, dry place and occasionally sprouted the seed may be well preserved.

Tile Drainage

I have just purchased 20 acres which I wish to drain or tile. It is almost level but falls a little to the southwest. The present outlet is a county or district ditch 80 rods from my west line. There is a 14 inch tile line along the roadside from the southwest corner to district ditch, but this tile is only 18 inches deep at my southwest corner and my neighbors tell me all of the fall has been taken up. I think I can get more fall east. Would you advise having it surveyed? What fall or grade should the tile have? Should the main line have more fall than the others? How deep should the tile in my field be to drain the land right? What size tile would you advise? How far apart should the lines of tile be? This is peat land and very soft in places. Will you please give me your very best advice. I will appreciate it very much. —Subscriber, Santa Ana.

We do not fully understand the situation from the statement of our subscriber, but one feature appears plain, the main outlet, or drain, is too near the surface to be of any great value. Eighteen inches depth would not give results from tile draining which would justify the expense. Even on sticky, fairly heavy adobe or clay the drains should be laid at a depth of three feet, and if soil is somewhat sandy, four feet. The shallower the system of draining the closer together the laterals must be laid. In addition the distance apart depends somewhat upon the nature of the soil. In rather a fine close soil the laterals should be 60 or 70 feet apart, while in a sandy soil where the moisture should pass more readily they may be perhaps twice that, providing they are at least three or four feet in depth. The grade or fall of the outlet should be at least one inch to each hundred feet. In the laterals it should be twice as great. The fall, however, depends somewhat upon the size of the tile. The above slope is given for tile at least five inches in diameter. The expense of laying three inch tile is not considered justified because it does not give so efficient service at any time and may choke or cease to be effective in a short time. A suggestion of possible value to our subscriber is to dig a pit or well at one corner of the place near the public outfall or drain, then place power pump in this to lift the drainage and throw it into the outfall. The United States department of agriculture has issued several bulletins and circulars on drainage, draining of irrigated farms, and other topics, and a letter to the department at Washington will secure these. We believe also the agricultural experiment station of the University of California at Berkeley has issued bulletins on drainage of alkali lands. These can also be secured on request to the university.

Hens Eating Feathers

I noticed article in the Cultivator of February 21 about hens eating feathers. I will say that it is a disease and I am going to give you a remedy that will surely cure it, as I have used it for years:

Place three lumps of lime the size of an egg in two quarts of water and with that drop in a quarter of a pound of powdered sulphur and boil gently for an hour. When cool pour off liquid, bottle and cork tight and label, and use a tablespoonful in a quart of drinking water daily for a week, allowing no other water to drink, and the feathers will soon come out again and they will stop eating them. I put ten drops in one quart of the water for incubator chicks and they will not pick one another. Wrap bottle in paper and keep in dark place.—Mrs. A. C. Landon, Watsonville.

VALUABLE KNOWLEDGE GAINED

"Well, Freddie," said his mother, "did you learn anything new at school today?"

"Yes'm," said Freddie.

"What did you learn new?"

"I got on to a new way o' gettin' out o' school for an hour an half, by snuffin' red ink up me nose."

This Month in the Vegetable Garden in Southern Arizona

By M. E. Bemis

THE gardener has almost as wide a range of seeds that may he planted in March as he has in Fehruary. The list comprises asparagus, heans, heets, carrots, collards, citrons, cucumbers, cress, lettuce, melons, mustard, pumpkins, okra, parsley, parsnips, peanuts, peas, onion sets, pepper seeds, pepper plants, radishes, salsify, spinach, tomato seeds and tomato plants.

Preparation of the ground is even more important than for the early garden, for the reason that the soil dries more quickly, hence it is more necessary to have a fine seed-hed and as much moisture as possible in the ground. There is more danger of the soil haking, hut on the other hand germination should be more rapid. There is not much danger of killing frosts, although it is hy no means certain that there will not he some frosts even as late as April first, hut the element of risk is comparatively small, so small that it does not pay to wait for a later date to plant seeds of tender plants. Tomatoes and cucumhers may he cut down, and the same is true of a number of others that are mentioned in the ahove list, hut as seeds are comparatively inexpensive and the early vegetables are worth so much more than later ones it is well worth the risk to plant early.

March is about as late as one can start an asparagus bed from seed. The Palmetto is the most popular variety and the seed should he planted in rows three feet apart and ahout one inch deep. Roots from this planting will be ready to transplant into the regular asparagus bed the following spring.

Beans are another tender crop, but for the early spring crop they should he planted in rows two to three feet apart. One pound of seed is sufficient to plant 80 feet. The following pole beans are recommended for this section: Kentucky Wonder, Kentucky Wonder Wax. Broad Windsor, and White Seeded Kentucky Wonder. Bush varieties are Stringless Green Pod, Black Wax, and Imperial Golden Wax. Burpee's Bush Lima and the Large Lima are to he recommended. Another hean grown here to some extent is what is known as the Aztec bean. It is claimed that the seed was found in one of the many cliff dwellings in Arizona and improbahle as it seems the seed was planted and grew. The seed resemhles the lima hean in size but is rounder. The pods grow to be more than a foot in length. These are not grown extensively although the quality is fair, rather hetter than the Tepary beans which like the Aztec seems to he peculiarly adapted to the arid climate.

Cucumhers, squash, pumpkins, citrons and melons should be planted in hills four to six feet apart each way. The following varieties of cucumbers are recommended for Southern Arizona: Klondike, Arizona Davis Perfect, Early White Spine, Improved Long Green and Boston Pickling. The Japanese climhing cucumher is grown somewhat as a novelty and is said to have fair quality but has never hecome popular on the market. Golden Huhhard and Fordhook squash are all right for this part of the country, and Mammoth Summer Crookneck and Early White Bush Scallop are fine for early summer varieties.

Cantaloupes are usually raised under field conditions only, although there is no reason why they might not be grown successfully in garden culture. Rocky Ford and Burrells Golden Gem are prohahly the most popular. Kleckley Sweet, Tom Watson and Rattlesnake watermelons are grown more than any other varieties, but the hlack seeded Chilian sells for the highest price on the local markets. Another melon that has come into popular favor to a considerable extent is the Honey Dew. This comes on about the time that cantaloupes are passing and is also shipped to a considerahle extent. Pumpkins are not grown as largely as one would expect, although they produce well and are of good quality. There is a good demand for them on the markets. Besides furnishing the family a few extra they should return a good profit. The Small Sugar, Large Cheese and Japanese Pie are found to do well.

Peanuts are being grown more than formerly and yield splendidly where a good stand is secured. With most growers that have experienced any difficulty ln growing peanuts the failure to get a stand is the chief trouhle. The Virginia Bunch has proved to he the hest adapted for Salt River Valley conditions. In loose soil they may be planted in rows three feet apart and 20 lnches ln the row. Some prefer to plant level or nearly so, gradually drawlng the earth to the plants, thus forming a furrow. Peanuts require considerahle water. They are not difficult to grow when a stand ls secured and production is heavy enough to make the crop pay well.

Salsify may be planted this month, the Mammoth Sandwich Island being the most popular. Tomatoes may he transplanted late in the month or earlier if protected. They may also he planted where they are to remain and later thinned out. Chalk's Early Jewel, Earliana and Stone are favorltes among growers. Last season one grower purchased hy mistake a considerable quantity of seed of a yellow varlety. The yield of these was splendid and the quality very fair, hut the market did not demand a yellow tomato, so that he lost heavily. For the home garden a few plants would he found to be a welcome addition. Pepper seeds may be planted at this time of year where they are to remain, saving the bother of transplanting. They may be planted in rows 2½ to three feet apart and thinned to 18 inches in the row. They require fertile soil and considerable water. The Mexican Chili and the Bell Pepper are popular.

APPLICATION OF MANURES

(Continued from Page 382.)

of this system as compared with other systems of applying manure include the conservation of the plant food values of the manure through its prompt covering and protection from weatherlng; the holding by the hunched manure of soil moisture hetween irrigation periods; the location of the manure in the fibrous root zone or that portion of the soil where normal fihrous roots are most usually found; the position of the manure below active cultivation where lt can remain undisturhed; and other factors which are more purely theoretical and need not he considered at this time.

With the present hlgh prices of organic fertilizers, lncluding manure, and the prospect of still hlgher prices in the immediate future it certalnly behooves everyone concerned to conserve and apply in the most economical method possible all of the manure available for the citrus orchards of Southern Californla.

JUST LIKE IRON

"My dear sir," sald the salesman, courteously, as he handed the customer his package and no change, "you will find that your suit will wear like iron."

And sure enough it did. The man hadn't worn it two months when lt began to look rusty.—Tit-Bits (London).

Keep Setting Hens Free from Lice

Put Dr. Hess Instant Louse Killer in the nests before adding the litter and eggs, then the brood will come off free from vermin. Put it in the dust bath—that's always a good thing to do. All fowls will sift it into the feathers and the lice will be quickly killed. Just as good for animals as for poultry. With one hand stroke the hair the wrong way, with the other sift in Dr. Hess Instant Louse Killer. Especially good for lousy colts and calves right now.

GUARANTEED

The dealer who sells you Instant Louse Killer is authorized to refund your money if it does not do as claimed.

1 lb. 30c, 2½ lbs. 60c (*except in Canada*)

Dr. HESS & CLARK

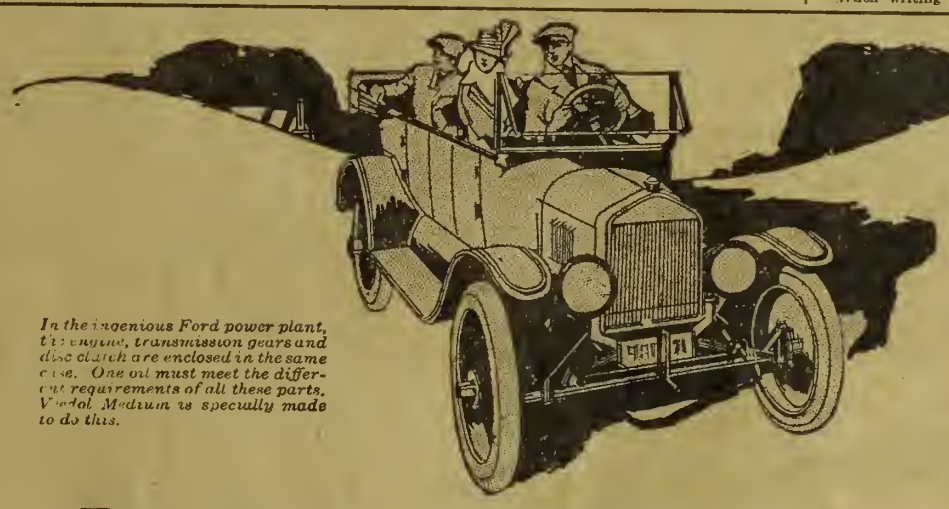
DR. HESS Instant LOUSE KILLER Kills Lice

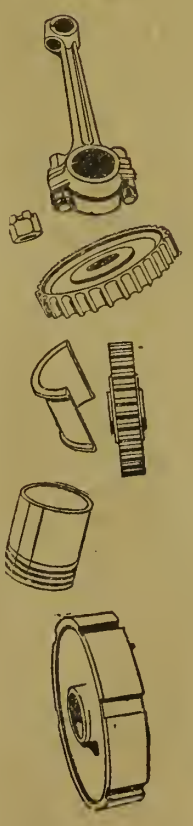
When writing advertisers, mention the Cultivator.



In the ingenious Ford power plant, the engine, transmission gears and disc clutch are enclosed in the same case. One oil must meet the different requirements of all these parts. Veedol Medium is specially made to do this.

Protects your Ford against this abuse

If poor oil or oil of wrong body is used, 97 parts are damaged



JUST as with the engine in the most expensive car, every moving part of the Ford engine must be perfectly lubricated.

The Ford engine is a wonderful piece of mechanism, compact and accurately made, but, like any other finely adjusted machine, it requires absolutely correct lubrication to develop its fullest efficiency.

Thousands of motorists and tractor owners have found that *90% of Ford engine troubles are caused by inferior oil.*

The hidden toll taken by sediment in ordinary oil

Ordinary oil breaks down under the terrific heat of the engine—200° to 1000° F. A great quantity of sediment forms which has no lubricating value, and which thins out the remaining oil.

The oil film is destroyed. Metal-to-metal contact results. Friction and wear begin. The engine over-heats. Bearings burn out. Carbon forms rapidly. Serious trouble inevitably follows.

Ordinary oil after use. Veedol after use. Sediment formed after 500 miles of running

How Veedol reduces sediment

Veedol reduces the amount of sediment formed in the engine by 86%. Notice the sediment test at the left. Veedol is specially made to maintain proper lubrication. Common engine troubles are almost eliminated. Evaporation is reduced between 30% and 70%—giving high mileage per gallon of oil.

Veedol Medium is specially recommended for Ford automobiles. Veedol Special Heavy is recommended by many Fordson Tractor and International Harvester Company dealers.

Leading dealers have Veedol in stock. Every Veedol dealer has a chart which shows the correct grade of Veedol for every car.

The new 100-page Veedol book on scientific lubrication will save you many dollars and help you to keep your car running at minimum cost. Send 10c for copy.

TIDE WATER OIL
Sales Corporation

8500 lbs. pull on the draw-bar

What does it mean to you?

IT MEANS tremendous power available for summer fallowing. It means the saving of the most moisture in your soil. It means rapid plowing of your ground before it dries out.

—it means that in harvest time you have the only power that will pull *any harvester anywhere.*

—it means that in the fall you can plow your land after the first rains come and finish the job before the ground gets too wet to work.

—it means that in other work, such as leveling, subsoiling or chiseling, you have the enormous power necessary to do a big job —economically.

The "Caterpillar" 75 Tractor is the only tractor on the market today that will give you 8500 pounds actual, usable power on the drawbar, at good plowing speed. The "Caterpillar" Tractor is essentially a farm business machine—a tractor that pays for itself by the profits it earns.

This Month in the Ornamental Garden

Northern California

By A. R. Gould

WITH longer days in sight we shall find this one of the busiest months, as we can plant, propagate, prune and plan for brighter and better gardens. The successful gardener is a dreamer; he sees visions and cultivates that excellent quality so necessary to secure good results—looking ahead. Most of the seedsmen have mailed out their catalogues and there is a wide field for selection, and it is so wide that the garden lover is al ways undecided as to which is the best. The average garden is not large enough to hold them all. Right here we would say that it is the civic duty of all to promote the garden beautiful movement from which each city and the state in general will benefit. California is known the world over for its wonderful climate and flowers, so let us increase the number of gardens and garden cities, which means more of the outdoor life and better and healthier people. Any house without a garden is a blot on the landscape. Get out the tools and prepare for a flower garden this year. Now is the time to sow and plant. We have been encouraged by the rains, which have put the ground into good shape for operations.

Some Old Fashioned Flowers

Of course there are lots of new flowers, or "novelties," as the seedsmen call them, many of which are well worth growing and the extra price asked for seeds or plants, but we continually meet people who are fond of a strictly old fashioned collection of flowers, and if you are anxious to set aside a corner of the garden to enjoy their sweet perfumes, we advise you to plant the following. For the borders make an edging of double white clove pinks. Plants may usually be secured or they are easily raised from seed sown in boxes of sandy soil. They are perennials and after a year or two may be increased by subdivision. Of the same family are the Sweet Williams, which should be planted in groups to be effective. They may be secured in separate colors or mixed. Holborn Glory is a large flowered strain. The columbine is another hardy perennial of considerable value and grows a little taller than either of the two first mentioned. There is now a wide range of delicate shades and the California hybrids of orange and yellow should find a place in this section. The Rocky Mountain type is violet blue and white. Rose Queen is one of the best of recent introduction. Sweet Lavender, without which no old fashioned garden is a reality, is easily grown and is used frequently to border walks or in bold groups. Plants may be secured now from the nurseryman. Among the annuals seeds may be sown of mignonette, Allen's Defiance or Goliath; evening scented stock, Mathiola, Ten Week and Brompton; snapdragons; Shirley poppy; nigella, or Love-in-a-Mist; larkspurs; calendula, or marigold, French and African; sunflowers; sweet peas and zinnias. Others in the perennial class are forget-me-not, or myosotis; primroses; Honesty lupines; heliotrope; pelargoniums and wallflowers. With the balsam, candytuft, violet, pansy and sweet violets we must conclude with the hope that space will be left to add many other subjects from time to time. The arrangement of this garden may be very simple and some prefer one style, some another. However, the old fashioned garden should have its stepping stones and sundial and a place to rest beneath a bower of roses.

Sweet Peas

Those sown last month should now be showing through the ground, and if the birds are troublecome cover with a net or wire screen.

Roses

Planting may continue throughout this month and those plants newly planted should be cut back to the last two or three buds. This will greatly encourage new growth. Roses thrive

The Keynote to Bigger Profits

Spraying is not an expense —properly considered — but an investment that pays for itself over and over again by producing more and better fruit and bigger profits.

But spraying must be done properly—at the right time, in the right way, with the right materials.

For example, there's nothing better for a dormant winter spray than Universal Brand Crude Oil Emulsion. It cleans the limbs of insect pests. It softens the bark and makes your trees healthier and more productive.

We have a bulletin covering the whole problem of insect control in deciduous orchards. Write for your copy today — a post card brings it.

Balfour, Guthrie & Co.

Manufacturers Universal Brand Orchard Sprays

350 California Street SAN FRANCISCO

816 Higgins Bldg. LOS ANGELES

UNIVERSAL BRAND CRUDE OIL EMULSION

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 110 to 220 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR COMPANY
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR," Price-list and Samples.

Please state for what purpose you use the sulphur, quantity needed and date of shipment preferred.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

INSECTICIDES AND FUNGICIDES

are big words, big with meaning to owners of both citrus and deciduous fruit trees.

There are two other words synonmous with these, they are: Orchard Brand. While these words may mean the same in one sense they are deadly enemies in another.

They are enemies of long standing. They have fought many a battle. Orchard Brand is the spraying material with which to fight these forever recurring pests. It is the ammunition, the poison gas, the means of eradicating them, when properly applied.

We've written all we know about these things and had it printed in a booklet to be sent you upon request.

While it tells about the results from the use of Orchard Brand spraying materials it also gives a lot of valuable suggestions to tree owners.

Write for it.

Also write for Bulletin No. 3 on Dormant Spraying of Deciduour Fruit Trees.

Other spray materials, for specific purposes, we recommend are:

Orchard Brand Dry Powdered Arsenate of Lead.
Orchard Brand Arsenate of Lead, standard paste.
Orchard Brand Atomic Sulphur (patented).
Orchard Brand Bordeaux Mixture Paste.
Orchard Brand Powdered Bordeaux Mixture.
Orchard Brand Lime Sulphur Solution.
B. T. S. Dry Sulphur Compound (patented).
Orchard Brand Weed Killer.
Universal Brand Dormant Soluble Oil.
Universal Brand Crude Oil Emulsion.
Universal Brand Miscible Oil.
Universal Brand Distillate Oil Emulsion.
Liquid Whale Oil Soap
Black Lead "40".

in fairly rich soil. Do not expect fine roses if you plant in poor soil.

Begonias

It is impossible here in these notes to even describe one-half of the varieties of this beautiful flower, as the number now in cultivation would fill many pages, but they are divided into the following types: tuberous rooted, fibrous rooted, winter flowering, and ornamental leaved. The last named are not very hardy and require protection in winter. In summer they may be planted out in a warm sheltered position. They are increased by leaf cuttings placed in sand. The most popular of the fibrous rooted section grown are semperflorens in red and pink shades. These are easily grown and increased by subdivision of the roots or by seed. They grow from six to 12 inches high and may be used for solid groups in the flower beds for the summer display. They should be planted out towards the end of the month in fairly rich soil. The tuberous rooted section has of late years been highly developed and many rare and beautiful forms produced, some tubers costing as much as $125. They range in all the most delicate shades in double and single forms; also a pendulent type much used for hanging baskets. Although it is possible to raise these from seed in a warm greenhouse or small glass frame, for the amateur it is better to secure tubers from the seedsman, who is now booking orders, and the tubers should be started without delay in boxes of soil made up of leaf soil and sand. Place the tubers a few inches apart in the box and cover with glass slightly shaded. Keep the soil slightly moist. After the tubers have started into growth and formed a mass of roots they may be planted in a shady position in the garden to flower. The ground should be richly manured and kept moist.

Climbers to Plant Now

Yellow and white jasmine, cobea scandens, mattress vine, wistaria, bignonia grandiflora, honeysuckle, clematis, solanum jasminoides and passiflora, all make an excellent floral cover for fence, arbor, trellis or house.

Beautiful Trees for Specimens

Cedrus deodara, C. atlantica, C. Libani, Abies pinsapo, A. excelsa, A. concolor, Pinus insignis, P. coulteri, P. cembra, P. excelsa, Araucaria excelsa, A. imbricata, Sequoia sempervirens and gigantea, Lawson cypress—from this choice selection you can plant a tree that will greatly improve your property in years to come.

Southern California

By Ernest Braunton

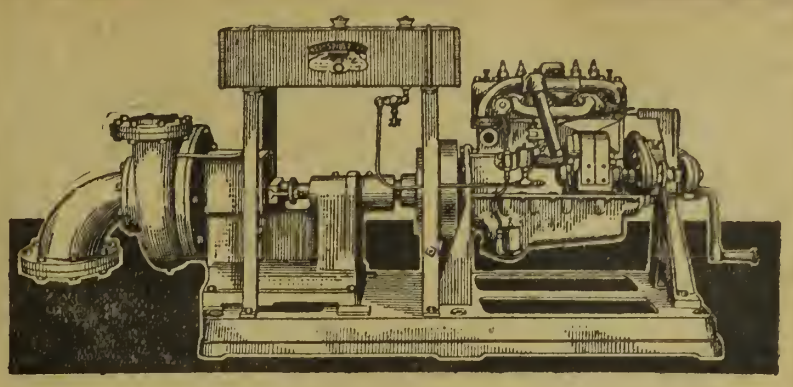
MARCH in California is usually a genuine spring month. Not until then does all dormant life warm into action. If it prove a cool month strictly tropical plants may well be left for April planting, but if continuous warm weather comes the soil temperature will rise to meet any reasonable need and all classes of plants will respond. Therefore there is not a garden activity but may go forward in March. We shall plant and also harvest, propagate, prune, cultivate, irrigate, and fertilize.

During no time of the year will fertilization bring better results. Plant life will be most active, therefore demand most in plant food. If applied earlier, rains may wash much of food value away and cool weather would not allow beneficial bacteria to do their best soil work. But now all life is more redundant than at other seasons and plants respond actively to the stimulus of food.

While of all fertilizers barnyard manure is the best for general use, the more concentrated commercial fertilizers have their greatest value in the spring season. All good gardeners use some nitrate of soda for stimulating sluggish plants, and its effects upon the early rose blossoms is as marked as that upon the onions and lettuce of the vegetable garden.

Seed Sowing

Seeds respond most quickly now, but the same heat that awakens will also kill if the soil is not kept moist near the surface. If one can pass through a sieve of quarter inch or half inch mesh some stable manure



WATER SURE!

Insure your crops this season—rain has been light—electric power will be hard to get unless it rains more.

All signs point to a dry season—provide yourself with our

Bean Direct Connected Engine Driven Unit

—the outfit that has made good.

It will give you continuous service—hundreds of them in use and every owner is a booster.

Be sure of your water.
Be sure of your crops.

Write us today for details about this plant. It throws more water than any other rig of equal size.

MORRIS & SNOW SEED CO.

439 So. Main St. Los Angeles, Cal.

or decomposed vegetable matter, a light mulch of such material is highly beneficial to seed beds, as it is to all plants as well. Still, one must exercise care in planting too deep. If a mulch is used, do not plant deeply in the soil, for an eighth inch of good mulch will protect seeds as much against drying as will an inch of the average soil.

Summer flowering annuals may be sown in great variety, but except in cool or coastal sections it is too late for sweet peas. If sown now they will flower in the hottest weather and flowers will be small, stems short, and the dark reds, perhaps others, will sunburn.

Aster, balsam, cockscomb, calllopsis, cosmos, larkspur, mourning bride, or scabiosa, nasturtium, pansies, pinks, phlox, salpiglossis, snapdragons, sweet sultan, verbena and zinnia are some of the more common and best for present sowing, but many others are equally in season. Bulbs of begonia, dahlia, gladiolus and tuberose are also timely.

Other Do's and Don'ts

Prune hydrangea, bignonia, bougainvillea and poinsettia now, but don't prune deutzia, lilac, spirea, syringa or weigelia, or you will prune away blossoms. These shrubs should be pruned after flowering for they then make the growth upon which next season's flowers are borne. Vines such as bougainvillea and the trumpet flowers may be cut back to a few long canes with laterals of but two eyes each, as we prune trellised grape vines.

Plant out Shasta dalsy and all sorts of perennial plants clear through the alphabet to and including verbena and violet. Feed roses heavily and some light pruning may be done, but annual blooming climbers such as Banksia, Beauty of Glazenwood, Cherokees and Gold of Ophir will soon blossom and if you prune now you prune away flowers.

Lawn work of all kinds should now be done. Especlally is this a time for making new ones or making over old ones. It is also the time to fertilize for the grass now makes its heaviest growth and therefore needs most food. The main point in new lawns is to have smooth surfaces, and these will never be any smoother than you leave them. Therefore tread over the whole surface for soft spots, and if you find any, tread the soil firmly, adding enough to bring the hollows up to grade. After grass is sown you can never get under it to rectify mistakes of grading.

Southern Arizona

By M. E. Bemis

ALTHOUGH many flowers are in bloom this month in Southern Arizona, such as sweet peas, pansies, violets, and poppies, there are many other kinds of flowers that may be planted now that will add to the beauty of the home grounds. This is the most important month for planting those annual vines which will furnish shade for porches or hide unsightly fences. The list for planting includes all vine seeds, asters, balsams, cockscomb, cosmos, four-o'clocks, helichrysum, cochia, larkspur, marigold, nasturtium, petunia, portulaca, sweet alyssum, verbena and zinnia.

Asters are splendid for bedding and make excellent flowers for cutting. The late flowering varieties of cosmos grow here to a height of five to six feet. Marigolds, if planted at this season of the year, bloom practically all summer. Four-o'clock is an old favorite that does well. Nasturtiums are generally planted in the fall, but may also be planted at this season. Zinnias bloom all summer. Verbenas, although perennials, will bloom the first season.

Of the running vines none makes quicker growth nor furnishes more dense shade that the balsam apple. The follage is attractive and porches may be made beautiful by growing the balsam apple beside it. The blossom is not especially pretty but the yellow and red "apples," with the green follage make the vines very pleasing.

Bulbs and plants that may be put out this month are dahlias, gladiolus, Madeira vines, tuberose, canna, caladium and roses.

This Month in the Vegetable Garden

Southern California

By D. F. Reichard

RAINS—glorious rains—have visited us during the last two weeks. Do not overestimate their benefits. The light rainfall of last year was not enough to soak down to meet the sub-moisture. The rainfall so far this year is insufficient to reach the sub-moisture, let alone to add to the subterranean reserve. Under such conditions this moisture shortage must be overcome either by irrigation during these months while water is plentiful and cheap or by advanced conservation methods.

If a garden plot has been started as suggested in these monthly articles, your ground has already been deeply plowed and worked over and now, after these rains, it should be gone over again by plowing any portion that is not already planted and by clean, careful cultivation of the planted portions. This careful and clean cultivation must continue on through the season if you are to conserve these rains

that are doing as much as they can by coming slowly and soaking in, instead of coming in heavy cloudburst and running off into the ocean.

Those who have been delayed in getting their garden plots under way should have them plowed at once. See that all weeds and grass are well turned under so that it is quickly decayed. This makes fine fertilizer. Then thoroughly pulverize the surface, and after each rain storm, as soon as the ground is in condition, throughout the spring go over the whole plot with a fine toothed cultivator to maintain this fine mulch blanket that keeps the moisture from evaporating.

Now for what to plant. There is still time to set out the perennials, such as artichokes, asparagus, rhubarb, and the berry plants, but the sooner they are in the ground the better. Keep these in rows as much to themselves as possible, so they will not be disturbed when the space for short time crop stuff is being worked. Practically the whole list of vegetables can be put in during March in Southern California. The only exceptions are where plantings are made in cool valleys where heavy late frosts are liable to come.

Watch diligently all growing crops. Attacks from insects and disease may show up at any time now. Especially look out for aphids. Keep some tobacco extract and a sprayer on hand to spray them at first sight. Spray with Bordeaux mixture or lime-sulphur for fungi prevention and arsenic sprays for chewing insect attacks. It is almost too late now to do any considerable pruning because in nearly all cases the sap is rising and your subject is liable to bleed to death.

Northern California

By A. R. Gould

THE recent welcome rains will increase both crops and weeds, the latter being so numerous that they will keep us busy with the wheel cultivator and hoe, which implements are just now the most important for success. All vacant plots should be thoroughly trenched this month and prepared for the season's crops. Again we would advise being liberal with manures, as it is useless to expect crops to be produced on poor soil or to take away year after year and put nothing back. Trench in farmyard manures, decayed leaves, etc., and put your soil in condition to supply plant food. Have your seed order filled this month and get the best your seedsman has.

Beets and Swiss Chard

Sow the following in rows 18 to 20 inches apart: Crosby's Egyptian and Detroit dark red. Thin later to four inches apart in the row. Swiss chard or sea kale beet is an excellent spinach and may be grown under the same cultural methods as applied to beets.

Parsley

Sow seed of the moss curled variety on a small seed bed; later transplant seedlings 12 inches apart in the row or use for bordering the paths in the vegetable garden.

Onions

Continue to plant onion sets three inches apart in the row and thin out the main crop varieties sown previously. Keep the soil well cultivated between the rows.

Peas

Sow for succession Little Marvel, Laxtonian and Melting Sugar. Spray for aphis with nicotine. Put stakes to the tall varieties such as Telephone or stretch wires along for support.

Asparagus

This crop should be well manured and planting completed this month by the first week. Plant strong roots three feet apart.

Tomatoes

Sow seeds of Early Detroit, San Jose Canner and Ponderosa in a warm frame on light soil. Keep the soil moist. Prepare the ground for this crop by deep cultivation, and well rotted manure should be dug in. Avoid planting in ground used for tomatoes the previous year in case there were diseased spores, which would attack this season's crop.

Carrots

Sow for succession Danvers Half Long and French Forcing. Thin out to four inches apart in the rows.

Turnips

Sow Early Snowball and Purple Top, both fine varieties for general use.

Celery

Sow in a frame or box covered with glass, White Plume and Golden Self Blanching. Place in a warm position and keep moist.

Radish

Sow in rows 12 inches apart, Crimson Giant and French Breakfast, in rich soil.

Potatoes

Tubers of Early Rose and British Queen may be placed in flat boxes to sprout. Medium sized potatoes may be cut in two, but see that they have at least two eyes in each. In the meantime heavily trench the ground for this crop with manure.

Lettuce

Continue to sow the varieties Los Angeles and May King, either broadcast in small seed beds or in rows in the plot where they are to remain, in which case sow 18 to 20 inches apart and thin four inches apart in the rows. Sow the seed very thinly.

Strawberries

Keep these well cultivated. They will repay every care given them. At the first sign of red spider or mite, spray the under sides of the leaves, where this pest is usually found, with a fairly strong solution of liquid sulphur, which will be found effective.

PLANTS FOR SALE

Of all the year the present is the most active season for setting out plants in the vegetable garden. Every seed store and plant nursery has on display rapidly diminishing stocks of young plants. A visit to a half dozen dealers disclosed the following on sale, ready for setting in the garden at once: Artichoke, asparagus, cabbage, cauliflower, chard, chives, egg plant, horse radish, kale, lettuce, onion, peppers, rhubarb and tomato. In addition to these were also sorts of berry plants, bulbs, etc., and one dealer called attention to eight named varieties of onion sets he was displaying. Get busy in the vegetable garden.

Fertilize with NITRATE of SODA buy it in sack lots-or carloads from

MONARCH CULTIVATOR

KILLEFER QUALITY

KILLEFER EFFICIENCY

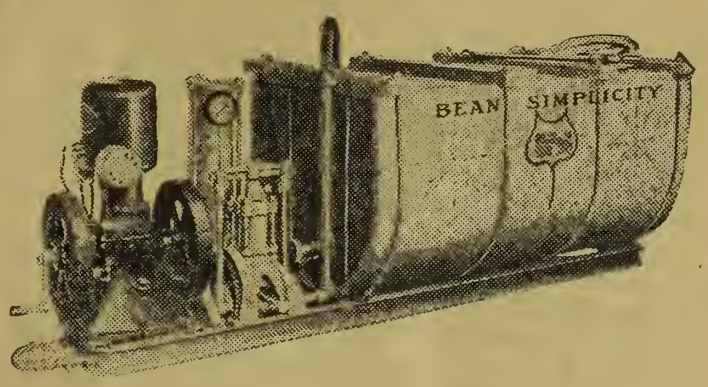
Our Monarch Cultivator is one of the most valuable implements a rancher can own, as it has more varied uses than any other implement we manufacture. As a Beet and Bean chisel it has no equal. As an Orchard cultivator, where deep cultivation is desired, it gives perfect satisfaction. As an Alfalfa cultivator, when fitted with our special Alfalfa teeth, it does excellent work, loosening the ground to a depth of from six to eight inches without injuring the stand.

When ordering a cultivator, be sure you get a MONARCH, as there are imitations on the market which do not stand the strain that the Monarch will.

The Monarch is made in 5, 6 and 8 foot sizes. We also build the Monarch in a heavier type for tractor work. Ask your home town dealer to show you the Monarch; if he does not carry them, write direct to us for catalogue and prices.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Los Angeles, Cal.



Here's the New

Bean Simplicity Sprayer

The same Bean dependability—the same high quality of both materials and workmanship, just as much efficiency, in fact a little more—but a highly simplified product.

Ask for information on these new Simplicity outfits. The one shown above is distinctly a "One-man" outfit for the smaller grower.

It's thoroughly high class in every respect—maintains 200 lbs. pressure and operates one spray gun doing the work of two men. It is low in price. It is described in full in our Catalog 33.

First Livestock Week a Success

By R. P. Royce

THOSE who had the privilege of attending the full sessions of the first Livestock Week held at the university farm, Davis, February 24-27, were very generally of the opinion that the week, the first of the kind ever held in California, was a decided success and that every effort should be made to make it a permanent event. While the attendance perhaps left considerable to be desired, the weather conditions that have prevailed throughout the state has been such as to slow the enthusiasm of those engaged in livestock production, but during the last day the severe drouth was effectively broken by a drenching rain and every one went home happy.

The idea of setting aside a week wherein could be grouped the interests of the beef cattle men, the dairymen and the swine men was suggested last spring by Professor Gordon H. True, of the animal husbandry department. For several years past there has been a disposition on the part of various livestock organizations to meet and hold sales at the university farm. For the most part such sales and meetings have been highly successful and it occurred to Professor True that inasmuch as the interests of the livestock men often overlapped it would be a fine thing if as many of the associations as possible could be induced to arrange their meetings and sales to come in the same week. The plan met with immediate approval and last week's meetings were the result.

Representative Livestock Men at the Davis Meeting

From left to right, standing: Robert Dunlap, Sacramento; A. D. McCarty, San Francisco; Ben A. Rhoades, Los Angeles; Frank Tomson, editor, Shorthorn in America; Thomas T. Miller, Hollister; E. Lowell, Diablo; Senator Ben F. Rush, Suisun; E. Franklin Colfax, Director of the California State Agricultural Society; J. McDonnel of San Mateo; W. M. Carruthers of Liveoak; W. Edwards of San Francisco, John Troop of Santa Barbara. Seated or kneeling: W. J. Dibblee of San Francisco, Secretary Charles Palne of the State Agricultural Society; C. N. Hawkins, Jr. of Hollister, Professor J. I. Thompson of the University Farm, Davis; C. Harold Hopkins of Woodland, George Dierssen of Sacramento, and W. Chapelle of Willits.—Photo by Mac & Nac.

To what extent the week can be developed in the future will depend upon what steps are taken by the university and the business interests of Davis. Davis is but a small village and the lack of sufficient hotel accommodations makes it necessary for visitors to stop in Sacramento. Such necessity is rather disagreeable and the trip to and from the capital city causes a loss of time and makes the holding of night meetings almost impossible. The situation is keenly appreciated by the university authorities and the townspeople of Davis and it is certain that steps will be taken to solve the problem.

That the idea is full of possibilities there can be not the slightest doubt. The plan is not new; other states have been holdings such meetings for years, indeed, in many of the Eastern states Farmer's Week has become one of the most influential factors in the agricultural activities of the state. While the eastern meetings can be arranged to take care of the majority of interests, it is probable that general meetings will not prove practical in California owing to the specialized lines of production.

In view of the fact that the first two days of the week were featured by sales of Herefords and Shorthorns, the program was arranged to include subjects of intimate concern to the range man and special emphasis was laid on range management and organization. The value of calf clubs was strongly urged and there was evidence that within the coming year a number of calf clubs would be organized and operated along the lines developed by pig clubs.

T. N. Lorenzen of the Shasta national forest explained in detail the methods used in classifying ranges in the national forests. T. J. Jones of the Plumas national forest discussed "Community Range Management" and pointed out the necessity of cooperation among the users of range if the most value is to be derived from the allotments.

Dean Thomas F. Hunt of the college of agriculture discussed the present status of the livestock industry and with an elaborate set of tables and charts pointed out the trend of prices. It was the opinion of Dean Hunt, based on extensive observations and precedent that the return to normal prices will require a number of years and can only come about through greatly increased production.

The afternoon of the first day was occupied with a sale of Hereford bulls and females consigned by members of the Pacific Coast Hereford Cattle Breeders' Association. Twenty-four females were cashed for an average of

What about your Cows Physical Condition at Calving?

Pasadena Cal
Nov 18, 1919

Great Western Milling Co
Dear Sirs.;
This is to state that we have used Besgrade dairy feed for the past two years having given Perfect satisfaction. We recommend it to all dairymen.
Star Dairy
by L. L. Wright

Feeding for heavy milk production should not be done at the expense of your cow's health.

Proper feeding is necessary to insure a heavy milk yield and still keep her in perfect physical condition for the critical time of calving.

The cow shown on the left is the mother of the twins above. She was fed

BESGRADE
Dairy Feed

and yielded a heavy milk production, yet when she calved, she was in perfect physical condition.

We guarantee a greater milk yield on Besgrade Dairy Feed than on what you are now feeding.

If you want a bigger cream check ask us to show you the way.

Great Western Milling Co. Los Angeles

and

Northwestern Milling Co., San Francisco

$426 and 30 bulls sold for an average of $375.

After the Hereford sale two two year old draft colts were sold. A Shire colt from the university stud fetched $300 and a Percheron consigned by M. Bassett of Hanford, brought $225.

The Wednesday session was opened by C. E. Ratchford of the forest service who presided for Fred H. Bixby, president of the California Cattlemen's Association. H. H. Simpson of the Inyo national forest discussed "Ways and Means for Range Improvement," outlining in detail the plan used by the forest service for determining the class of stock to be used, the carrying capacity and plan of management for best results.

Geo. H. Wilson of the university gave a very interesting talk on "Supplemental Feeding for Range Cattle." Wilson pointed out that the time had come when the range interests of this state must seriously consider providing some sort of feed to carry cows and young things through periods of short feed. Wilson urged a wider development of the water resources of the ranges and exhibited samples of grasses that promise to be of great value in range development. The practicability of silos in range management was suggested.

O. M. Plummer, manager of the Pacific International Livestock Exposition, Portland, told of the part that livestock shows play in the development of the agricultural resources of a state and declared that the results obtained through the holding of an annual show at Portland could not be estimated and urged that every effort be made to assure the holding of such a show at San Francisco.

Wednesday afternoon was given over to the annual spring sale held by the California Shorthorn Breeders Association, a detailed report of which will be found elsewhere in this paper.

Thursday was swine day. Originally it had been planned to hold a sale of Poland China bred sows and gilts but some difficulty developed that prevented getting the necessary number and the sale was therefore called off. During the morning the annual meeting of the California Swine Breeders Association was held. Roy Filcher of Corcoran, who has played an important part in developing the auction plan of selling fat hogs, declared that through that plan of selling the prices paid the San Joaquin raisers have generally ruled higher than the primary Eastern markets, and said that this method of selling is susceptible of extensive development. He pointed out that through the auction sale the producers had learned the kind and quality of pork demanded by the buyer and that better boars and more efficient feeding methods had been stimulated.

J. Francis O'Connor of Santa Rosa, who has made a marked success in the pure bred hog business, gave an interesting account of his experiences in starting a breeding herd. O'Connor took particular pains to urge the importance of starting with the right kind of breeding material. Professor J. I. Thompson of the university farm explained the feed law that is now in operation and showed how to make practical application of the information appearing on the tags attached to mixed feeds. Thompson then discussed in a general way the important factors in preparing a satisfactory ration.

Moving pictures of the winning Poland Chinas at the 1919 National Swine Show were exhibited.

The afternoon session was largely given over to a discussion of contagious abortion in swine. Until quite recently, within the past month as a matter of fact, contagious abortion in swine has not been considered a factor in swine production. The disease has been known for a number of years, but the degree of infection has been so slight that little or no attention has been given it. Early in the year an outbreak was discovered in Missouri and was reported in the Poland China Journal. Almost at the same time the disease made its appearance in California herds and since that time other outbreaks have been reported. Because of the extreme menace of the infection the University of California lost no time in making investigations. Experts from the veterinary department were assigned to the work and for several weeks past have been working night and day to learn something of the trouble. The animal husbandry department undertook to make a survey of the swine herds of California to ascertain the extent of the infection and to date reports from 115 herds indicate that about nine per cent of the herds reporting have had losses from abortion. One breeder reported at the meeting that he had lost 30 litters this season. Other herds report smaller losses. Doctors Hayes and Traum, who have been carrying on the university investigations, and Doctor Haring, chief of the veterinary department, outlined the work accomplished by the institution to date. In the opinion of each the disease may develop into one with most serious consequences to the swine breeding interest of this state. So far there is considerable evidence to indicate that the same organism that causes abortion in cattle, the bacillus of Bang, is responsible for the infection in swine. As a matter of fact the experts have succeeded in isolating an organism found in infected sows, that can not be distinguished from the one known to cause abortion in cattle. Blood tests made from aborting sows have given the same reaction as similar tests used in cattle abortion. The disquieting feature of the disease is the fact that the veterinary profession can offer very little definite information as to how the trouble can be handled. California swine interests are in a fortunate position however in having Dr. Traum who is responsible for first finding the bacillus of Bang in sows, and who is generally recognized as one of the leading abortion experts in the veterinary profession. The university authorities have recognized the importance of the new infection and have announced that no stone will be left unturned that may lead to a successful method of combating the trouble. Plans are being made to carry on extensive experimental investigations and it is expected that the swine growers of this state will cooperate in every way possible to the end that some definite knowledge can be developed.

Following the conference on abortion the California Swine Breeders Association met in annual session and the following officers and directors were elected: A. D. McCarty, San Francisco, president; Roy M. Filcher, Corcoran, vice president; Frank B. Anderson, Sacramento, secretary. The directors are: C. B. Cunningham, Mills; J. Francis O'Connor, Santa Rosa; J. I. Thompson, Davis; M. Bassett, Hanford; J. E. Thorp, Lockeford and Harold Braly, Newbury Park.

The dairy interests held the stage on Friday and one of the largest crowds of the week was present. J. R. Gallagher, president of the Bodega Cow Testing Association, told of the value of testing associations to the individual farmer and the community. Gallagher used his own experience as a case in point. When he first became identified with a testing association he had 99 cows that produced 13,000 pounds of fat a year. By adopting a plan based on the slogan: "Breed, Feed and Weed," he has reduced his herd to 75 cows with an annual production of 19,000 pounds of fat. The labor required has also been reduced.

S. H. Green, secretary of the California Dairy Council, told of the present dairy situation. Greene presented much information regarding the production of dairy products of this state and country as well as the leading foreign dairy nations. Greene declared that the great need was for more educational propaganda not only among the city population but among the dairy producers.

John S. Watson of Dixon, vice president of the Associated Dairymen of California, urged the necessity of cooperation among dairymen and pointed out the many benefits that have resulted from the operations of the existing dairy organizations.

Professor F. W. Woll of the university outlined the plan for the proposed California State Dairy Cow Competition for 1920-1922. Professor Woll said that the plan had progressed far enough to make the holding of the competition a certainty and that it was likely that an extremely attractive prize list could be depended upon. A committee was appointed to assist in formulating the classification.

During the afternoon session a judging demonstration was held by Professors Rubel and Castle. Representative types of the various breeds were used.

The De Laval Milker

Exclusive Advantages

The De Laval Milker is a distinctly different type of machine, positive and uniform in action. It is faster, more reliable and more sanitary than any other method of milking.

Among the many new and exclusive advantages in its construction are the following:

Udder Pulsator, close to cow's udder—insuring uniform, snappy action of teat-cups.

Pulsation speed cannot be adjusted or tampered with—always uniform and pleasing to the cows.

No pulsator springs, washers or regulating screws—pulsator has only one moving part.

Alternating action at fixed speed—the two front and the two rear teats milked alternately and uniformly.

Self-adjusting teat-cups—fit both large and small teats.

Pulso-Pump—especially designed rotary machine providing the vacuum and the mechanical control of Udder Pulsator.

Sanitary design—every part is accessible, easily cleaned and sterilized. Many farms where the De Laval Milker is used market certified milk at top prices.

The name "De Laval" is insurance of satisfaction.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

Shropshire Sheep

April 17, Butte City Ranch, Butte City.

It is reported that there are at least 61,000 head of cattle ready for shipment to Europe as soon as the extreme cold on the Atlantic is somewhat modified. This should be a hint worth thinking over, at least, to livestock breeders of America.

To those interested in Poland Chinas the sale to be held in Hanford, March 13, by W. L. Haag and Son and John M. Bernstein should be attractive. Animals sired by or bred to some of the breed's most popular boars will be included in the sale, which offers excellent opportunity for buyers to secure the blood lines they desire to add to their herds. Their first sale, held last September, attracted buyers from practically all parts of the state and it was considered by many breeders present as one of the highest class offerings ever seen in the state.

Greenwood Farm, Live Oak, reports the following Duroc sales: Fall boar by Johnson's Defender Jr., to Gerald Chalmers, Gridley; fall gilt to Dr. R. S. Christenan, Yuba City; bred sow and gilt to Chester Gregory of Inwood, Shasta County. The sow taken by Mr. Gregory has been one of the best producers in the Greenwood herd, having produced a number that were shown at the last state fair. The gilt is a daughter of Johnson's Defender Jr. Mr. Gregory is a progressive young farmer-breeder who is doing pioneer work in the North.

Thos. F. Caesar & Son, Poland China breeders of Reedley, have just received two bred gilts from Eastern breeders. Both are by Lakeside Timm, a son of Frazier's Timm, and are out of a daughter of Gerstdale Jones. The Caesars are using a son of Kings Buster out of a daughter of Long Giantess.

At the annual meeting of the Pacific Coast Hereford Cattle Breeders' Association, held at the university farm, February 24, the following officers were re-elected: J. H. Cazier, Welis, Nevada, president; H. M. Barngrover, Santa Clara, vice-president, and J. A. Bunting, Mission San Jose, secretary. At the meeting the members of the association passed strong resolutions in favor of a livestock show to be held annually at San Francisco. Several new breeders became members.

California and Nevada Aberdeen-Angus breeders met at the university farm, Davis, during Livestock Week, and formed the California-Nevada Aberdeen-Angus Breeders Association. Wm. H. Smith, Brook Hollow Ranch, Hollister, was elected president; C. N. Langton, Visalia, vice-president, and C. A. Noggle, Lilac Ranch, Escondido, secretary. J. P. Doherty, Western fieldman for the American Aberdeen-Angus Association, assisted in the organization. Doherty, who has recently taken up his work, is greatly impressed with the prospects for Angus cattle in this territory and while in this state was given a number of substantial orders for breeding stock.

Poland China breeders are jubilant over the announcement that C. Harold Hopkins, who is establishing a breeding farm near Davis, will soon lay the foundation for a select herd of the big blacks. J. I. Thompson, now with the university, will manage the new farm. A superior herd of Shorthorns has already been started.

John A. Bunting, owner of the Mission herd of Herefords, Mission San Jose, is now in Arizona for the purpose of selecting a carload of high class Hereford females. Bunting says that the demand for Hereford breeding material of quality is such that he is compelled to increase his herd.

Following a banquet the night after their sale, members of the California Shorthorn Breeders Association elected C. N. Hawkins, Hollister, president; T. S. Glide, Davis, vice-president; D. J. Stollery, secretary. The directors for the current year are: Henry M. Elberg, Woodland; T. Wilson Dibblee, San Francisco; T. T. Miller, Hollister; Gordon H. True, Davis, and Benj. F. Rush, Suisun. The association is considering a plan for engaging a state fieldman.

McCarty and Starkweather, Poland China breeders of Modesto, have purchased from Williams Bros., of Iowa, a gilt sired by The Yankee and out of a Big Fred dam. The new addition to the herd carries the service of Long Boy, a son of Giant Buster.

V. F. Doicini, June Acres Farm, Davis, is reported to have refused a very attractive offer for his herd boar, Choice Wonder 3d. Choice Wonder 3d is by Mahaska Wonder and is a litter mate to the boar that topped the recent Kern sale in Nebraska, selling for $3,600.

C. B. Cunningham, Mills, who closed out his entire herd of Chester Whites during the past season, has given his well known herd boar, Billiken, to E. E. Fulton of Fair Oaks. Cunningham hesitated to part with that famous old sire until he was assured that he would go to a good herd.

Adirondac Wietske Dairy Maid, the great 41 pound cow owned by Bridgford Holstein Co., Patterson, recently dropped a fine heifer calf by the three times grand champion bull King Segis Alcartra Prilly, and has something like 37 pounds butter to her credit in seven days on official test so far, and is milking as high as 120 pounds per day. A three year old daughter of King Pontiac Konigen in the same herd has about 31 pounds butter to her credit in seven days and is still on test.

Announcement has just been made that W. J. Higdon of Tulare will sell his entire herd of Holsteins with the exception of a small herd of heifers not yet in milk. Further details will be forthcoming in due time. The sale is scheduled for April 28.

On April 29 the Holstein breeders in the vicinity of Tulare will hold a consignment sale. Included in the sale will be the major portion of the R. C. Sturgeon herd.

The sale of dairy bulls held at the university farm in connection with the program arranged for "Dairymen's Day" served to distribute a useful lot of well bred Jersey, Holstein, Ayrshire and Guernsey bulls. Jersey bulls sold at prices ranging from $100 to $430. All the Jerseys were taken by members of the Sonoma County Cow Testing Association. A Guernsey bull calf, consigned by Hollow Hill Farm, Colton, fetched the highest price of the sale, selling to George Waddell, Oakland, for $485. Three Holsteins were offered. Two sons of King Korndyke Pontiac, consigned by Fred W. Kiesel of Sacramento, brought $375 and $360, respectively. One of these went to the Weimar Joint Tuberculosis Sanatorium. The young bull from the Toyon Farm Association, Los Altos, brought $285. One Ayrshire, sent to the sale

by the LeBaron Estate Company of Valleyford, brought $100.

In a recent letter from R. K. Walker, manager of the Winsor Ranch, Bonita, he says: "I want to give you the data on the recent sale of Duroc-Jersey bred sows that broke all records for the Duroc breed. On February 5 Ed Kern of Stanton, Nebraska, sold 60 head of sows bred to Great Sensation and his world's grand champion son, Great Orion Sensation, for an average of $1,831 per head. This is a world's record for the breed. In that sale 40 head averaged $2,300 a head, the sale totaling $10,000."

J. H. Crawshaw, Hanford, has purchased from Robinson Bros., Morton, Illinois, a Poland China bred gilt sired by Giant Bob, one of the good sons of the noted Big Bob.

W. A. Young, Lodi, was a purchaser in the Robinson Bros.' sale, securing a gilt sired by Giant Bob for $500. Mr. Young also purchased a daughter of Orange Boy in the Serven & Son sale, Bushnell, Illinois. Orange Boy was the sire of Liberty Boy, grand champion at the 1919 Illinois state fair.

J. P. Walker, who for years has been breeding Duroc-Jerseys on his ranch near Visalia, has recently completed a new farrowing house heated by electricity. Orion Crimson Lady, the sow for which he paid $1,500 in the recent sale held by Diamond Bar Ranch, is expected to farrow, early in March, a litter by Ace of Pathfinders. Another sow, Big Queen, bred to Orion King Jr., grand champion at San Francisco Livestock Show, will also farrow early in March and from these two litters Mr. Walker expects to select his futurity candidates. About 60 head now comprise the herd, of which 14 sows will farrow in March.

On Hillcrest Farm, Caruthers, where the Victory herd of Holsteins is maintained, Lelia Korndyke Hengerveld, a junior three year old heifer, has just completed a test, making 27 pounds of butter in seven days. At the head of the Victory herd is Sir Piebe DeKol Segis Pontiac Count, considered by many as one of the breed's greatest sires. Recent sales include a yearling bull to C. R. Cutten, Goshen.

MOLDY, MUSTY OR MILDEWED HAY

J. G. Jackley of the state department of agriculture gives warning as to the danger in feeding spoiled hay or fodder. He says:

"Horses are especially susceptible to moldy or damaged fodder. Probably all animals, including sheep, cattle, hogs and chickens, are affected harmfully in the order named.

"Chickens exhibit what is termed wry neck as a symptom when they become sick as a result of eating moldy or decomposed food. Horses show paralytic conditions, are unable to stand, with special weakness in the hind quarters. Cattle and sheep appear somewhat similar.

"It is believed that the sheep which died when turned upon cut-over rice fields were probably injured by picking up grain or straw that had become decomposed, moldy, etc., as a result of lying on the moist ground.

"Many hypotheses have been advanced with reference to the losses of sheep referred to. Whether it is a specific fungus that is toxic or whether it is due to the presence of specific bacteria, e. g., B. botulinus, the organism that so frequently causes food poisoning in man, or whether it is due to starvation as advanced by others, is yet a moot question which must eventually be settled. Some believe that chemical substances may be in the chaff or the hulls of the rice grain which does the harm. Others advance the idea that a specific infection exists, as hemorrhagic septicemia. It is probable, however, so far as hemorrhagic septicemia is concerned, that this is more of a secondary trouble than the primary cause of the disease, since this organism may attack any animal when the vitality has been lowered by some other cause. It probably is not sufficiently virulent in itself to bring about the initial infection."

The Guaranty Sale

80--Superb Registered Holsteins--80

at Public Sale, Thursday, March 25, 1920
State Fair Grounds, - Sacramento, Cal.

This is without question the greatest offering of registered Holsteins ever made by Western breeders, and it ranks among the very greatest ever made anywhere.

The difference in values between real top breeding animals and the commoner sorts of all kinds is growing wider rapidly, as evidenced by the wide spread in prices, a fact which should attract the serious consideration of the beginning breeder as well as the breeder already established.

In this offering the committee of selection and the consigning breeders have cooperated to assemble a herd that contains first class individuals throughout, and the buyer in this sale has the benefit of unusually careful selection before the animals are presented in the sale ring for his appraisement.

Following is a partial listing of the females to be offered:

A 35 POUND GRANDDAUGHTER OF KING OF THE PONTIACS, now on yearly test and bred to King Korndyke Pontiac 20th.

A BEAUTIFUL 33 POUND COW that made 30 lbs. as a 4 year old. Will be fresh before sale.

A 33 POUND three quarter sister to Raphaella Johanna Aaggie 3d, the world's record holder for milk in one year under strictly official test. Will be fresh at sale time.

A 33 POUND SECOND CALF, 4 YEAR OLD sister to a 33 pound cow and a 32 pound cow. On yearly test and bred to King Korndyke Pontiac 20th.

A 32 POUND SENIOR 3 YEAR OLD that made over 20,000 lbs. milk and over 750 lbs. butter in one year as a junior 2 year old. Bred to King Korndyke Pontiac 20th.

A 32 POUND COW that has a 30 lb. 4 year old daughter, also in the sale, a 33 lb. 4 year old sister, also in sale, and another 33 lb. sister. Now on yearly test and bred to King Korndyke Pontiac 20th.

A 32 POUND COW that made over 30 lbs. at previous freshening. Now on yearly test and bred to King Korndyke Pontiac 20th.

A 30 POUND daughter of Korndyke Queen De Kol's Prince out of a half sister to Tilly Alcartra. Bred to King Korndyke Pontiac 20th.

A 30 POUND JUNIOR 4 YEAR OLD daughter of a 32 pound cow, bred to Sir Aaggie De Kol Acme 2nd, five of whose seven nearest dams average 1154 lbs. butter in one year.

A 30 POUND daughter of Arcady Pontiac Wayne Hengerveld. Bred to Sir Aaggie De Kol Acme 2nd.

A 30 POUND SENIOR 3 YEAR OLD bred to King Segis Pontiac Jannek.

A 29 POUND great granddaughter of King Segis, still on test and bred to King Segis Pontiac Jannek.

A 28 POUND daughter of King Pontiac Segis Korndyke. Now on strictly official yearly test and bred to the three times grand champion bull King Segis Alcartra Prilly.

A 28 POUND COW of splendid type, bred to Prince Walker Cornucopia, 36 lb. son of Prince Gelsche Walker.

A 28 POUND granddaughter of Johanna De Colantha Champion, bred to King Korndyke Pontiac.

A 27 POUND COW 4 YEAR OLD with 748 lbs. butter from 17854 lbs. milk in one year as a junior 3 year old. Bred to a 34 lb. grandson of a 1200 lb. 3 year old.

A GREAT 27 POUND COW whose sire is out of a half sister to Tilly Alcartra and whose dam is a half sister to the 37 lb. cow Boweda. Bred to Sir Aaggie De Kol Acme 2nd.

A 27 POUND daughter of Arcady Pontiac Wayne Hengerveld, bred to King Segis Pontiac Jannek.

A 27 POUND granddaughter of Colantha Johanna Lad out of a granddaughter of Sir Skylark Ormsby Hengerveld, bred to the $106,000 bull Carnation King Sylvia.

A LARGE NUMBER OF 25 AND 26 POUND COWS of rich breeding, excellent type, some with yearly records, and bred to outstanding bulls.

A 24 POUND 2 YEAR OLD daughter of Sir Veeman Korndyke Pontiac, bred to King Sadie Vale Idyl Segis, a 35 lb. grandson of King Korndyke Sadie Vale and King of the Pontiacs.

A 23 POUND 2 YEAR OLD daughter of Sir Veeman Korndyke Pontiac, bred to King Sadie Vale Idyl Segis.

A 21 POUND 2 YEAR OLD daughter of King Korndyke Sadie Vale 22nd, bred to a 32 lb. son of King Morco Alcartra.

A WONDERFUL LOT OF 2 YEAR OLDS with records up to 21 lbs. butter in 7 days, most of them now on yearly test and bred to the highest class bulls.

A NUMBER OF RICHLY BRED HEIFERS OF SPLENDID TYPE, now bred to drop their first calves, including daughters of Prince Gelsche Walker, King Mead of Riverside, King Korndyke Pontiac 20th, Sir Veeman Korndyke Pontiac, King Pontiac Netherland Segis 3d, a daughter of a 1000 lb. 4 year old granddaughter of Tilly Alcartra, two daughters of Sir Aaggie De Kol Acme.

Bulls of Rich Breeding and Splendid Type

Nine of the best bulls available will be sold in this offering, including:

A SHOW BULL with an average of 934 lbs. butter in one year for five of his 7 nearest dams.

A GREAT YOUNGSTER by a son of a 31 lb. 2 year old, out of a 23 lb. junior 2 year old now making a large yearly record, second dam a 31 lb. cow that made over 30 lbs. as a 4 year old and over 800 lbs. in one year, third dam a 30 lb. cow that made 1129 lbs. butter in one year.

A SON OF KING KORNDYE PONTIAC 20TH out of a 32 lb. 3 year old that made over 20000 lbs. milk and over 750 lbs. butter in one year as a junior 2 year old.

A SON OF KING SEGIS ALCARTRA PRILLY, the three times grand champion bull, out of a 33 lb. daughter of a 37 lb. son of King of the Pontiacs. His first 11 dams average 30.54 lbs. butter in 7 days and he is a wonderful individual.

A HIGH CLASS YOUNG BULL by a son of a 36 lb. 3 year old that made over 1200 lbs. butter in one year, out of a 31 lb. 2 year old granddaughter of Aaggie Cornucopia Johanna Lad.

A SON OF KING PONTIAC NETHERLAND SEGIS 3D out of a 28 lb. cow that has a 25 lb. 3 year old daughter and a 17 lb. 2 year old daughter.

A SON OF PRINCE WALKER CORNUCOPIA, out of a yearly record daughter of an 1117 lb. cow. The dam's record will be completed by sale date.

A SON OF KING KORNDYKE PONTIAC 20TH out of a 26 lb. 4 year old daughter of Prince Gelsche Walker and a 29 lb. daughter of Korndyke Queen De Kol's Prince. A white bull of excellent type and out of a dam that is most promising for a very large record.

A SON OF KING ORMSBY CANARY JOHANNA, who is a 34 lb. son of Sir Pietertje Ormsby Mercedes, out of a 19 lb. junior 3 year old whose dam is a 32 lb. granddaughter of Colantha Johanna Lad. An excellent individual of most popular breeding, the first grandson of Sir Pietertje Ormsby Mercedes ever offered at public sale in California.

The Modesto Sale

Modesto, March 18, 1920

50 Registered Holsteins 50

This offering contains offerings from eight well known Stanislaus County herds, including a considerable number of A. R. O. cows and daughters of such cows, many of them in calf to some of the best bred bulls in the state. The sale includes:

A 26.19 POUND DAUGHTER of Pontiac Jewel Butter Boy, bred to the three times grand champion King Segis Alcartra Prilly.

A 25.45 POUND GRANDDAUGHTER of Colantha Johanna Lad out of a sister to the 37 pound cow Boweda, bred to King Alcartra Prilly.

A 22 POUND GRANDDAUGHTER of Ignaro De Kol, bred to an 823 pound son of King Segis Alcartra Abbekerk.

A 21 POUND 3 YEAR OLD half sister to the state record 2 year old Belle Faskie De Kol Witkop, bred to Segis Pontiac De Kol Dutch, whose three nearest dams are all 1,000 pound cows.

A 21 POUND 4 YEAR OLD daughter of a 26 pound cow, well along with calf to King Segis Alcartra Abbekerk, proven 30 pound son of the $50,000 bull.

A 16 POUND COW bred to Segis Pontiac De Kol Dutch, whose three nearest dams are all 1,000 pound cows.

A GRANDDAUGHTER OF SEGIS PONTIAC DE KOL BURKE out of a 27.54 pound granddaughter of Hengerveld De Kol, due to calve April 17 to the 41 pound $5,000 bull King Abbekerk Johanna Segis.

TWO A. R. O. HEIFERS bred to the 41 pound bull Sir Johanna De Kol Rag Apple.

A NUMBER OF WELL BRED A. R. O. COWS in calf to a highly bred son of King Mead of Riverside.

THREE GOOD COWS bred to a 31 pound son of El Prado Wayne Colantha.

A CHOICE LOT OF COWS AND HEIFERS in calf to a well bred grandson of Colantha Johanna Lad.

A DAUGHTER OF THE 41 POUND BULL Sir Johanna De Kol Rag Apple.

A GOOD SELECTION of unbred heifers of desirable breeding and individuality.

A Bull Offering of Real Quality

A SON OF KING SEGIS ALCARTRA ABBEKERK out of a dam that made 823.19 pounds butter in one year from 19,439.4 pounds milk in one year. He was a first prize winner at California International and is ready for heavy service.

A SON OF KING SEGIS ALCARTRA PRILLY, the three times grand champion bull out of a 21 pound 2 year old daughter of the 41 pound bull King Valdessa and a 28 pound daughter of a 30 pound bull.

A GOOD SELECTION OF YOUNG BULLS of substantial breeding and good individuality that should interest dairymen.

"FEEDFINE" FEEDS

are scientifically compounded in proper proportions for dairy and all livestock feeding, of the following ingredients with the most economical results always in view.

YEAST — A concentrate high in PROTEIN and FAT content, sterilized and predigested.

CANE MOLASSES — The richest of feeds in carbohydrates—produces increased appetite on account of its palatableness. Its consumption results in increased energy and it is the best tonic known for animals.

ALFALFA MEAL — Gives body to the ration and supplies the mineral matter which is absolutely essential to all animals.

The greatest known combination for health, strength and productiveness.

Bargains in Shorthorn Sale

The Shorthorn sale held at Davis, Livestock Week, seemed to suffer more from unfavorable feed conditions than the Hereford sale. The average quality of the Shorthorn offering was of a character that should have received higher appreciation than was actually accorded it, and the condition of the offering was such as to leave little to be desired. Sixty-two head were sold, the females averaging $398 and the bulls $451.

A splendid crowd was in the seats when Frank D. Tomson, editor of The Shorthorn in America, opened the sale with a most impressive talk. Tomson cited the part that the Shorthorn has played in the improvement of the cattle stocks of this country and declared that the trend toward better blood was inevitable and that fact furnished sufficient reason for a large expansion of the industry, but he counseled that those who enter the business take it up with the idea of staying in the business.

The sale developed a dearth of buyers for well bred females and for the better bulls, but there seemed to be a strong demand for bulls around $500 to $700, and many of the bulls that hit around those marks were taken by small range men. One delegation of nearly a dozen range men from the Hat Creek country was on hand and secured a number of the tops.

The top bull was the good red son of True Dale, Pacheco Cumberland, consigned by the Pacheco Cattle Co., Hollister, and sold to A. S. Nichols of Sierraville for $925. Geo. E. Diersen of Sacramento, who has been assembling a select herd during the past year, made a very excellent buy when Clarion, the very attractively bred roan bull from Carruthers Farms, was knocked down on his bid of $800. J. I. Thompson, who is to be associated with the breeding establishment of C. Harold Hopkins, Woodland, made some careful selections. The University of California secured two bulls to be used in an extensive range experiment.

The top female was sold by the university to William Bond of Newark. She was the white daughter of Sultans Mayflower, selling at $825. The top consignment was furnished by the Pacheco Cattle Co., and the second high average was made on the initial consignment of the Blackhawk Ranch. Col. Ben A. Rhoades of Los Angeles cried the sale and was assisted in the ring by Ord L. Leachman of Sacramento.

The complete list of sales follows:

KINGS COUNTY POLAND CHINA BREEDER'S SALE

The ninth semi-annual Poland China sale of the Kings County Poland China Breeders' Association was held in Hanford, Saturday, February 28. Thirty-four animals sold for a total of $2,227.50, some of which were as good as have been seen in any of the sales this year. A number of those sold were young while quite a few lacked proper development, which had its effect upon the general average. The top of the sale was found in Miss Orphan 2nd by Orphan Bob, consigned by W. Bernstein and sold to W. T. Dice, Hanford, for $275. This was one of the best sows seen in any of the winter sales and Mr. Bernstein in selling her at this price had to take quite a loss. H. D. McCune, Lemoore, secured a good sow from the C. A. Vaughn consignment for $210, while B. S. Cole, Hanford, secured an excellent sow by Giant Jones, consigned by Harold S. Waltz for $175. The remainder of the offering sold up to $125, including a number of fall sow pigs which were purchased by the breeders for fall sales. Col. Geo. W. Bell of Tulare, was the auctioneer assisted in the ring by Col. Cy Clark of Modesto.

MEETING OF CALIFORNIA JERSEY BREEDERS' ASSOCIATION

The California Jersey Breeders' Association met at the University Farm, Davis, on Friday, February 27. This was during the dairy part of the program of Stockmen's Week. The meet-

For Cows Only

KOW-KURE

W. Nicholls, Trempealeau, Wis., writes: "I have used KOW-KURE with entire satisfaction. The first box I used saved for me two valuable Guernsey cows which would not breed."

Most barrenness is caused by a weakened condition of the nerves and muscles of the genital organs. In such cases, KOW-KURE is an unfailing remedy, because it acts directly on these organs, giving them the strength to function properly. You take no chances in using KOW-KURE; it has a quarter century of success back of it.

KOW-KURE is equally valuable in preventing or treating Abortion, Retained Afterbirth, Milk Fever, Bunches, Scours, etc. Sold by feed dealers and druggists; 60c and $1.20.

Send for valuable free treatise, *"The Home Cow Doctor."*

Dairy Association Co., Lyndonville, Vt.

every time you lay your horses up for sores. Use Bickmore's Gall Cure—cure them while they work! Money back if it fails. At all dealers, 35c, 70c, and $1.40. Also ask for Bickmore's Horse Liniment.

For yourself, always keep handy Bickmore's XYZ Skin Ointment and Bickmore's XYZ Family Liniment. Ask your dealer for them.

GALL CURE

Shorthorn Steers

The Shorthorn steer carlots at the International, Chicago, sold for $25.69 per cwt., the highest average of any breed.

Thos. Johnson, Columbus, O., sold 100 Shorthorn steers last October at the farm for $19 per cwt. They weighed 1,592 lbs. making a gain of 400 lbs. in five months.

It pays to grow Shorthorn beef.

have sold more than $500,000 worth of registered cattle in our sales, under the most stringent requirements laid down by any sales organization in America. Satisfied buyers have been the rule in all our sales.

CALIFORNIA BREEDERS SALES & PEDIGREE CO.,
C. L. HUGHES, Sales Mgr. Sacramento, Cal.

ing was attended by 40 Jersey breeders and they had a most interesting session. The association came out strongly in favor of a statewide dairy cow competition conducted by the University of California and pledged $150 cash to be turned over to the committee in charge, to be used as prize money.

Judge Peter J. Shields of Sacramento was appointed committeeman to represent the California Jersey Breeders' Association on the state dairy cow competition committee. New members were voted into the association, as follows: Major C. F. Tilden, Occidental; Wm. S. Miller of Occidental, Frank Donnell of Petaluma and L. W. Krohn of Arcata.

SHORT FEED DID NOT STOP HEREFORD BUYERS

The two sales of registered beef cattle held at Davis last week furnished the most satisfaction to date that the doctrine of better blood is fast gaining ground in this state. With drouth conditions scarcely equaled in the history of the cattle business in California staring them in the face and pessimistic predictions that no buyers would be on hand, the Pacific Coast Hereford Cattle Breeders' Association claimed the first of the two days set aside for the beef cattle sales and sent through the ring 54 head of bulls and females for satisfactory prices. The 30 bulls averaged $375 and the 24 females registered $426. While the prices do not seem high they were liberal in view of the average quality and condition of the offering. The outstanding feature of this sale as well as the sale of Shorthorns the following day was the evident willingness on the part of range operators to pay for the better things. The day of the $150 bull is over.

The vendue served to furnish the foundation for a number of new herds, the heaviest buyer of the better females being the Napa State Farm, Napa. Manager Duffy was on hand and succeeded in getting many of the best females.

Other heavy buyers were: J. G. Roberts of Madera, J. F. Dunne of Gilroy, R. C. Jacks, Monterey, and Professor Gordon H. True, buying for the Pioneer Plantation of Maui, Hawaii, and the Newhall Land and Farming Co., Santa Maria.

The top female was furnished by the University of Nevada in the four year old cow, Pomona, a granddaughter of McCord, and a heifer calf at foot by Beau Perfection 34th. She was purchased by J. A. Niles of Porterville for $925.

The top bull, and the top of the sale, Prince Patrician, came from the Barngrover consignment and was taken by J. F. Dunne at $975. The Barngrover consignment was one of the top priced lots and was presented in nice condition.

The top consignment of the sale was the lot entered by the University of Nevada.

A feature of the sale was the females sold by Cazier carrying the service of Beau Blanchard 76th, regarded as one of the best young bulls of the breed.

Eighteen buyers absorbed the offering in one of the snappiest sales held in this state in a long time. Col. Ben A. Rhoades was on the block and made many friends by his splendid work. C. L. Hughes of the California Breeders' Sales and Pedigree Co., managed the sale. Frank Van Natta of Indiana represented the American Hereford Association. John A. Bunting and H. M. Barngrover worked the ringside.

The detailed report follows:

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Relief. Gombault's Caustic Balsam will give you immediate relief. A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy
Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

INCREASE IN HERDS ON SEMI-OFFICIAL TEST

An increase of 26 per cent on semi-official or long time testing in herds of pure bred dairy cows in California over the previous month is announced in a statement recently issued from the college of agriculture of the state university. The announcement follows:

"During January semi-official or long time testing was commenced in 13 herds of pure bred dairy cows in California. This marks an increase of 26 per cent over the number of herds on long time test the previous month. This increase is not merely seasonal but in testing undertaken for the whole year. Records of production throughout the whole lactation period are coming more and more to be recognized in this state as the best guide in breeding and measure of production value. Of the herds commencing long time testing, nine were Holsteins, three Jerseys and one Milking Shorthorn.

"The total number of pure bred herds in the state carrying on advanced registry testing during January is as follows: 42 Holsteins, 24 Jerseys, seven Guernseys, three Ayrshires, two Milking Shorthorns. Forty-one dairy test supervisors were engaged in the work during the month.

"On account of very high production retests were carried on in seven Holstein herds and one Jersey herd. Of the Holstein retests, four were carried on in herds on yearly tests, involving new animals, and four were called for on animals on seven day tests."

ARIZONA WOOL GROWERS MEET

On Saturday, February 14, the Annual Mid-Winter Meeting of the Arizona Wool Growers Association was held at the Adams Hotel in Phoenix and was well attended, owing to the fact that nearly all the outfits are wintering south this year.

The meeting was called to order by President Hugh Campbell, and the work of the morning consisted chiefly of discussions and adoption of resolutions.

Of particular importance was the discussion of the "Eat More Lamb" campaign now being put on by the National Wool Growers Association. As a result of the "Eat More Lamb" campaign the consumption of lamb in Duluth, Minnesota, was increased from 300 to 1,600 head per day. Results are also showing up well in the South. Some towns in the South that very seldom consumed mutton are now consuming nearly as much mutton as beef. No little credit for this increase is due to the home demonstration agents who have put on demonstrations in cooking the various cuts of mutton in connection with the "Eat More Lamb" campaign.

The enactment of a law requiring manufacturers to label woolen cloth giving exact amounts of the different fabrics contained in the cloth was also discussed.

President Chas. P. Mullen of the Arizona Cattle Growers Association spoke to the association on matters of relative importance to both sheep and cattlemen. It was decided to establish an advisory board representing the Arizona Wool Growers Association in conference with the officials of the forestry service in conjunction with a similar board representing the Arizona Cattle Growers Association.

PROGRESSIVE IMPROVEMENT IN SIRES

"It has long been taken for granted by the best stockmen that only registered males are worth using," says Dr. R. H. Williams, animal husbandman of the university. "It does not matter what kind of livestock one breeds, whether on the farm or range, the foundation of success and profit must be based upon registered sires." Quoting further Dr. Williams says: "No intelligent stockman would consent to discuss the relative merits of grade or scrub and pure bred males any more than question the statement that one and one make two. They haven't time or desire to discuss such an absurd thing, and if they say anything it will be, 'You haven't any right to raise stock of any kind unless you use the best you can get.' We all know that registered males are none too good. If you stay in the business you will and must use registered males. That point is settled for all time and you may as well accept it.

"But there are good and ordinary registered males. The first few crosses may have improved the animals greatly even if ordinary registered males were used. Breeding is a progressive undertaking. With each cross of a registered sire it becomes more and more important to select better males. That is why breeders of registered animals pay such high prices for herd headers, for they know that improvement in registered stock depends upon the kind of sires selected. The same condition obtains in grade animals. Herds, flocks and studs that have been improved by the use of better and better sires must continue to select better males each time or progress is halted. The only short cut that I know of in improving livestock is extreme care in the selection of good sires and surrounding the animals with the best conditions possible for the development of their best characters.

"Many range stockmen claim that they can't afford to pay higher and higher prices for males. That is a great mistake, for they can't afford not to pay higher prices each year for the right kind of males. The important consideration for them is that the animals selected shall be better than those formerly used and this requires a great deal of study and experimentation on their part.

"In order to maintain the present quality of the animals and improve them, more money must be paid for better males. One must use good judgment, however, in selecting better animals, and the best index of the worth of them is the price paid. Sometimes the price is not an accurate index of the merits of males, but this is the exception. Stockmen should be willing to pay more for their sires, for price of good cattle has advanced, in keeping, more or less, with the cost of everything else."

SWINE RATIONS INCLUDING ALFALFA

The object of fattening hogs is not growth so much as fat. Corn is the main dependence in the production of fat in the United States; the only substitutes of any importance are the grain sorghums. Enough alfalfa, shorts, tankage, or other protein feeds are used to balance the ration.

The following swine rations, including alfalfa, are suggested by W. E. Schneider of the Arizona Packing Company and secretary of the Arizona state farm bureau:

Brood sows, dry: (1) Alfalfa pasture alone best during dry season. (2) Alfalfa pasture; one pound of grain daily.

Brood sows with litters: (1) Allow 3.5 pounds of grain per 100 pounds live weight daily, consisting of milo, hegari, barley, corn, feterita 60 parts, bran 10 parts, shorts 10 parts. Alfalfa pasture or hay at will.

Growing pigs: (1) Allow 2.5 pounds of grain per 100 pounds live weight daily, consisting of milo, hegari, barley, corn, feterita 65 parts, shorts 30 parts, tankage five parts. Alfalfa pasture or hay at will.

Fattening hogs: (1) Allow 3.5 pounds of grain per 100 pounds live weight daily, consisting of milo, hegari, barley, corn, feterita. Alfalfa pasture or hay at will.

(2) Allow 3.5 pounds of grain per 100 pounds of live weight daily, consisting of milo, hegari, barley, corn, feterita six parts, shorts one part. Alfalfa pasture or hay at will.

CATTLEMEN'S ASSOCIATION IN LOS ANGELES

The semi-annual convention of the California Cattlemen's Association will be held April 15 and 16 at Los Angeles. Several men of national prominence are expected to speak at the convention, among them Senator John B. Kendrick, president of the American National Livestock Association. Invitations to address the convention have been extended to Franklin K. Lane and Herbert Hoover.

With this convention a membership drive of the association will be launched in Southern California. Arrangements are now being made for a big meeting to be held at some point in the Imperial Valley and another in San Diego County.

BUILD A SILO

If you want to save on feed,
Build a silo.
It will help in time of need;
Build a silo.
Build of concrete if you would;
Build of brick or build of wood;
Build of anything that's good,
But build a silo.

Dairy feeds are soaring high;
Build a silo.
Summer seems a-goin' dry;
Build a silo.
Cows, too, go dry on hay,
Sort of seem to fall away;
They need silage every day,
So build a silo.

Pasturage costs quite a heap;
Build a silo.
Winter feeds are never cheap;
Build a silo.
Build it wide and build it deep,
'Cordin' to the cows you keep,
And for milk you'll never weep,
So build a silo.

That's the burden of my song,
Build a silo.
If you've cows you can't go wrong;
Build a silo.
Milk will flow, and smiles'll come,
With the separator's hum,
And you'll shout, "I'm glad, by gum,
I built a silo."

—Anonymous.

CALCO Grain Bins are rain proof

1918 season and 1920.

So far they have been pretty much alike, haven't they?

Do you remember the early fall rains of 1918?

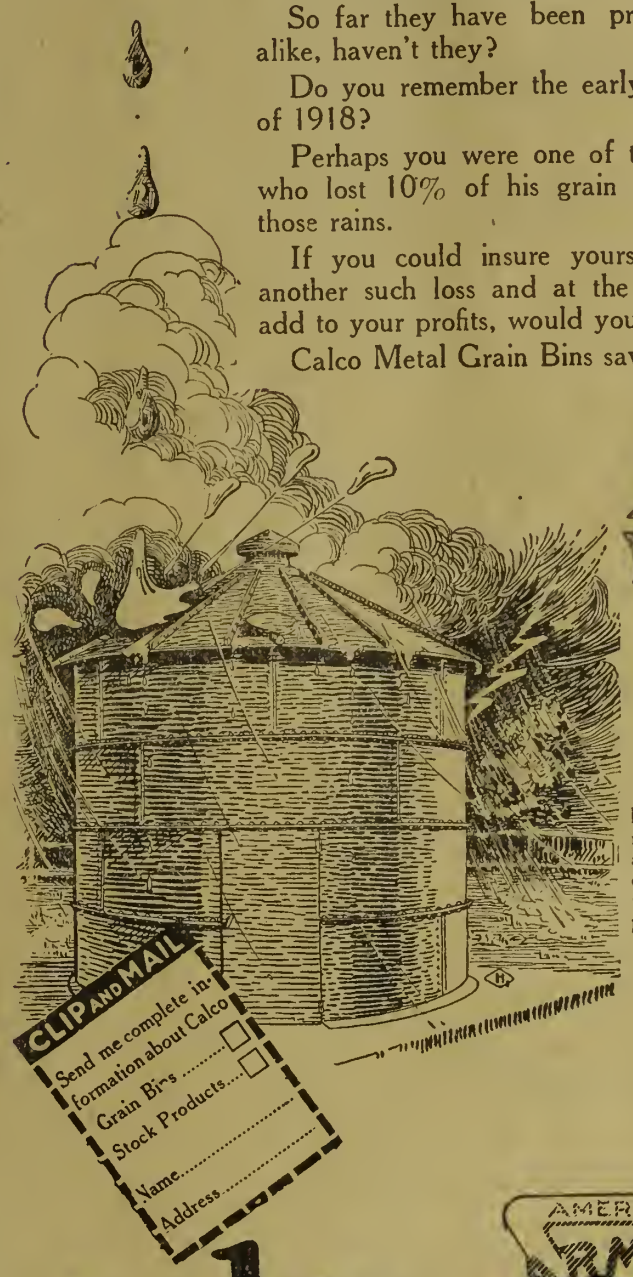
Perhaps you were one of the farmers who lost 10% of his grain because of those rains.

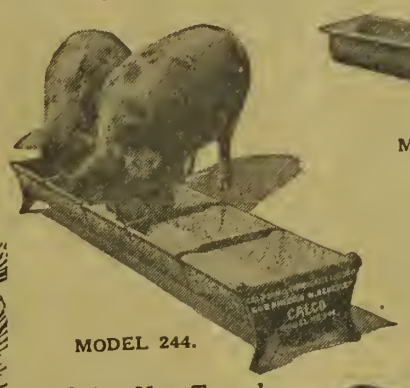
If you could insure yourself against another such loss and at the same time add to your profits, would you do it?

Calco Metal Grain Bins save every bit of grain from rain. They save the cost of sacks. They cut down the labor expense, and save the waste from rats, squirrels, mice and vermin.

Calco Bins are made from rust-proof Armco Iron. They are durable, lasting and easily erected. Their cost is comparatively small.

Remember that their first cost is their only cost. Write today for booklet which gives complete information, descriptions, and comparative costs.

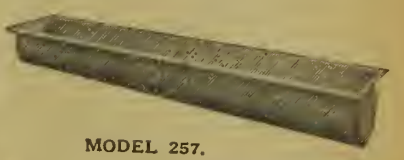




MODEL 244.

Calco Hog Trough

Built for feeding or watering hogs. Made of Armco rust-resisting, Galvanized Iron, they are sanitary, strong, durable and economical. They come in sizes to fit every farm. Write for prices and description.



MODEL 257.

Calco Sheep Trough.

For watering and feeding sheep. Made from Armco Galvanized Iron and is clean, sanitary and durable. Easily moved from place to place. Send for size and price list.

MODEL 258

Calco Self Feeder.

Supplies fresh, clean grain to hogs automatically. It lessens the labor of feeding. It saves the grain from being scattered and wasted and keeps the feed supply clean and sanitary. Prices and sizes upon request.

5 37% FAT

What does it mean?

SIMPLY this: It costs less to feed Jerseys than any other breed and they produce the richest quality of milk (butter fat average of 5.37%). Jersey Milk churned into butter and cheese bring the highest prices on the market.

Jerseys are the real "cow investment"! They start producing at an earlier age than any other breed and are still great milkers long after other cows have gone dry.

Let us give you some surprising information about Jerseys in our free booklet "Profitable Facts About Jerseys". Write today for it.

THE STATE COMMERCIAL FEEDING STUFF LAW

By Professor F. W. Woll

IT is evident from inquiries received by the state university that dairy farmers and stockmen are interested in the state commercial feeding stuff law, which went into effect November 1 last year. The law was enacted by the legislature of 1919 at the urgent request of the various state livestock associations and of others interested in the quality of the feed sold to our farmers, and was approved by the governor on May 16 last year. The provisions of the law, with the rules and regulations for its enforcement, are given in a pamphlet issued last fall by the state board of health, which is charged with its enforcement under the law. This pamphlet also contains definitions of commercial feeding stuffs, information as to the administration of the law, average analysis of cereals and by-products, etc. Copies of the same can be obtained upon application to Bureau of Foods and Drugs, Berkeley, which takes care of the inspections and analytical work connected with the enforcement of the law.

Many samples of commercial feeding stuffs have been received of late by this division or by the writer direct. While always glad to furnish information and advice concerning feeding problems and other subjects within our special field of study, we are unable to comply with requests for making analyses of feeding stuffs and other materials. Neither can the food and drug laboratory undertake such analytical work, as will be seen from the following quotation from the pamphlet referred to above:

"Samples — Manufacturers, agents, dealers and consumers are requested not to forward samples of feeds or other materials to the bureau of foods and drugs, since to do so is a useless expense, as the only samples analyzed are those secured by official inspectors in the open markets of the state.

"The bureau of foods and drugs will not analyze samples for manufacturers for the purpose of making a guarantee. Such an analysis should be made either by a private or commercial chemist."

The guarantees for valuable food components in feeding stuffs which are required by the law refer to total protein, fat, etc., and not to digestible components. Since the digestibility of different concentrated feeds and of feeds of the same character in general does not differ greatly, the relative value of two feeds is approximately indicated by the relation between the contents of the guaranteed components of the feeds. With two samples of wheat bran, for instance, guaranteed to contain, one, say, a minimum of 15 per cent protein, 4 per cent fat and not over 10 per cent fiber, and the other 12 per cent protein, 3.5 per cent fat and less than 12 per cent fiber, the former is the better feed. A rough estimate of how much better it is may be made by comparing the sum of the guarantees for protein and fat in each, making 19 per cent for the former against 15.5 per cent for the latter. The relative value of the two feeds is not represented by these figures, since the carbohydrates, an important group of substances including starch, sugar and similar compounds contained in each, are not included, but the figures given furnish the best means of comparison that can be had in the absence of a complete chemical analysis and data for the digestibility of the two feeds.

At the present high prices for all kinds of feed materials, farmers should note carefully the guarantees under which feeds are sold, and when there is a choice should select the ones that supply the largest amounts of valuable feed components at the lowest cost. A low priced feed, however, is often not the best one to buy; a comparison of the guaranteed composition will suggest which one is actually the cheaper feed. The law offers a buyer protection against fraud and misrepresentation in the sale of commercial feeding stuffs, but it is for him to decide whether he will take advantage of the information thus furnished. The figures for guaranteed composition that manufacturers must give are a most valuable aid in judging the quality and relative economy of different feeding stuffs.

FARM BUREAU MARKETING ASSOCIATION SALES

The California Farm Bureau Marketing Association reports recent public sales of fat hogs:

Tulare, February 10, 556 hogs ranging from $13.10 for one small bunch averaging 295 pounds to $15.10 for those averaging 181 pounds. Two hundred pounds, or thereabouts, proved most attractive.

Visalia, February 11, 500 hogs averaging over $10 for 53 only weighing 118 pounds to $14.95 for those averaging 209 pounds.

Hanford, February 11, 392 hogs, $10.10 to $14.85. Most of the sales were above $14 and the $10 bunch weighed only 74 pounds.

Corcoran, February 13, 135 hogs, $13 to $15.10.

McFarland, February 14, 519 hogs, $12.60 to $15.25.

Turlock, February 17, 249 hogs, $11.90 to $14.90.

Le Grand, February 18, 183 hogs, $10.60 to $14.85.

Fresno, February 20, 281 hogs, $12.95 to $15.10.

DAIRY INSPECTION

Bronte A. Reynolds, editor of the state department of agriculture, gives a summary of the recommendations or line of action adopted at a meeting of inspectors recently held in department rooms at Sacramento:

That greater attention should be given to those factors that directly influence the quality of the product, such as the cleanliness of milking, the use of the small top bucket, proper sterilization, etc.

That the long felt need for a summary and explanation in simple terms of the law concerning dairies; for a summary of the factors of greatest importance in the production of milk and dairy products of good quality; for a summary of the laws and regulations on Babcock testing and like subjects, should be met by the issuance of circulars on these and similar subjects.

That the power lodged in the hands of this department to hold manufacturers responsible for acceptance of milk or other dairy products which are dirty or are produced in an unsanitary dairy should be exercised. Upon discovery by the inspector of dirty products or of unsanitary conditions in a dairy the manufacturers to whom the product might be sold should be notified of these facts. The manufacturers may not then accept the milk from this dairy until the conditions are remedied. By this means the effectiveness of the work of this department should be greatly increased, the necessity of many prosecutions should be avoided, the manufacturers should be aided in securing a better product, and the dairy industry in general should be spared the unwelcome publicity which attends court actions.

That as soon as possible and to the extent found practicable, the work of inspection should be guided by information obtained by an examination of the product. In this way the time spent in the inspection of dairies which are producing a good product would be more profitably and intelligently spent in inspecting dairies which are producing a poor product. Also, by pointing out to the individual dairyman the particular in which his product is deficient, and by supplying him, in the form of the above mentioned circulars or otherwise, information whereby the deficiency can be corrected, it is probable that many inspections may be avoided. Thus it is hoped that a given amount of work can be made productive of much greater results.

It is confidently believed that when these policies are actually in operation great good will result for the whole dairy industry of the state.

EPSOM SALTS FOR CHOLERA

Sulphate of magnesia, or epsom salts, is a specific for stomach and bowel troubles, and for what is called heartburn it is far better than baking soda. Why not a specific for hog cholera? Will someone please try it?—R. R. S.

God made the pure air, but unless we breathe it freely it profiteth us nothing.

Discretion is more to be desired than resuscitation.

—And For Any External Hurt

Besides its well-known value in keeping the udder and teats healthy, Bag Balm is a wonderful healer of any cut, bruise, chap, chafing or wound. An application will immediately relieve the pain and heal the injured tissues.

No dairy barn should be without its package of Bag Balm. It has no equal for the prompt and successful treatment of Caked Bag, Cow Pox, Bunches or any of the congested conditions of the udder and teats that frequently occur at the calving period. An occasional application will prevent soreness and make the cow an easy milker.

Feed dealers, druggists and general stores sell Bag Balm, in 60c packages. Write for our free booklet, "Dairy Wrinkles."

Unsigned communications receive no attention.

Scurvy

Please tell me what causes scurvy in a young calf four months old. This is the second time this has broken out on this animal. We have fed besides the milk a little Blachford's meal and a little hay and green alfalfa each day. The trouble did not show the first two months while the calf was on milk entirely.—Subscriber, Oceanside.

The trouble is probably caused by a mite that is in the stable, the calf getting it by rubbing the wall or a post that is near. Get a pint of zenoleum or some other good "sheep dip" of your druggist. Put about half a teacup of the medicine in half a bucket of warm water and sponge the calf all over with the solution, soaking the skin well, then put on a blanket until the calf is dry. It will be well to repeat this treatment once or twice four or five days apart. Also prepare some thin whitewash and add some of the sheep dip to it and whitewash the sides of the stable. Sweep the floor clean; sprinkle some of the whitewash on the floor and put in new straw.

Pigs Died

I have two young gilts with their first pigs which I kept in a close pen and fed slop and soaked barley until the pigs were two weeks old, then I turned them out on green feed consisting of barley, alfalfa and some sour clover. The pigs began dying at once. First they became helpless in their hind parts and could not get up; later their tongues would become swollen and they died in about four hours. Can you tell the cause of this disease?—Subscriber, Calipatria.

Cannot say unless it was the exposure to the cold, damp ground. The cold and dampness would cause rheumatism and the muscles would cramp so they would become paralyzed. In the winter it would be best to keep them in a warm, dry place until they are four or five weeks old and then let them out only for a short time in the middle of the day when the sun is shining. It is a wonder that so many young animals do survive in spite of the exposure they are subjected to.

Bloody Milk

I have a cow half Jersey and half Holstein that at times gives bloody milk from one teat. She now has her fourth calf and it is five months old. During this period of milking and also the one before this the milk was bloody for a couple of weeks or more, then it seemed all right for a month or more when it became bloody again. It is not lumpy and appears all right when just beginning to milk but before I am through it is almost pure blood. She is fed alfalfa hay and runs on alfalfa pasture. What can I do for her?—Subscriber, Escalon.

Any one of many different things may cause milk to be bloody, a bruise, a small tumor in the udder, too rich feed, etc. In your case it may have started by an injury that did not heal properly. Milking seems to irritate it and starts the blood. Be very careful when milking and do not pull the teat. Just get the milk by squeezing the teat carefully. Bathing the quarter with cold water will probably help. Get eight ounces of the tincture of iron and give half an ounce in some feed once a day while it lasts. This will put more fibrin in the blood and help the healing.

Prof. J. I. Thompson will soon be general manager of the Hopkins Stock Farm, Yolo County.

The Duroc-Jersey Sale of the Season

Dr. Belknap of San Jose, Cal., will on

MARCH 10

beginning at 12.30 o'clock

sell one of the finest breeders herds on the Coast. Orions, Great Wonder I Am, Colonels, Pathfinders, etc. Some of them mammoth in size. Great boar pigs and the herd Orion boar, a crackerjack. A surprise is in wait for the Duroc fanciers. Catalog will be out in few days; send for your copy.

Cheaper Money, More Money for the Farmer

PERHAPS our readers have noted in scanning market, or rather financial review, pages of the city press that money commands one price in one center, or rather, in one calling, and another price in another. "Six per cent in industrial centers and eight per cent in agricultural centers" indicates about the difference between the prices money is commanding from the merchant or the industrialist and from the farmer. "Why?"

And the answer to this, which might be easy and seem reasonable to some, would require considerable space to give. But the question calls attention to an interesting fact which is the only reason for mentioning it at this time.

We have received the following letter in which it will be seen that we are taken to task for calling attention in a recent issue to investigations undertaken by the Commonwealth Club of San Francisco. It is possible there may be selfish effort on the part of some members of the Commonwealth Club in seeking the information desired. Neither would we discuss that, though we do not believe such to be the case. But there is one outstanding fact in agricultural practice of this country—the farmers must have cheaper money. This need has been met to a very limited extent by the federal farm loan.

The federal farm loan is one of the finest pieces of financing this country has yet undertaken; it has enabled far larger agricultural operations and doubtless resulted in greater food production during the last few years. It has its limitations, and the law making it possible has its faults as is shown by the fact that its best friends are today working for revision. For instance, it is felt that a mistake has been made in limiting the amount that can be borrowed under this law to $10,000, and the proposed revision would raise this limit to $25,000. Other features will be corrected and every step possible taken to make the federal farm loan a still greater aid to agriculture, but as it is it has always had the heartiest commendation of the California Cultivator as evidenced by hundreds of references and articles touching upon its methods and advantages.

The reference to the effort of the Commonwealth Club was not intended in any sense to be a criticism of the federal farm loan. However, we are rather glad it was so taken by one of the farm loan's warmest admirers who lives in San Diego County. We say we are glad, for the reason that it has brought from him a defense. The writer is W. A. Van Loon, secretary treasurer of farm loan association at Ramona, San Diego County.

By W. A. Van Loon

In the last issue of the California Cultivator, printed February 21, was an article, presumably written by yourself, entitled "Investigating Federal Farm Loans," and purporting to outline the activities of the Commonwealth Club of California in endeavoring to find ways and means for providing farmers with long time loans at a low interest rate and preferably on the amortization plan.

I cannot recall having read anything in years that aroused my interest and curiousity as did that article. It gave me a peculiar shock that fairly benumbed me for a time and spurred me to write you about the subject mentioned in that article.

The California Cultivator has commanded my respect for years because of its vigorous and intelligent interest in rural problems of all sorts. The Commonwealth Club of California has been long regarded as a powerful and useful organization seeking out benefits for the classes and masses; so it will be in no spirit of criticism or censure that I shall speak in the paragraphs following this sentence.

That the Commonwealth Club of California should start an investigation to determine the most feasible, or best, or most practicable way to have a federal farm loan system established, and should mail out printed questionnaires broadcast to ranchers to get expressions from them on the subject, and that a great paper like the California Cultivator, which circulates almost entirely among ranchers, should take the time and space to give a detailed statement of this move, will, under the present circumstances, always be to me "a dark and bloody mystery," inasmuch as we now have in full operation an intensely active, robust and aggressive federal farm loan system, which is placing on eligible ranches tens of millions of dollars every month and has been doing so for more than 30 months; and one of the states to be best served and most greatly benefited by the making of these federal farm loans is the very home state of the California Cultivator and the Commonwealth Club of California.

It will surely be a source of amusement to many, many ranchers when the questionnaire from the Commonwealth Club, which apparently has been sent out, gets into their hands, for there is no possibility but that if any considerable number has gone out they will come into the hands of ranchers whose ranch loan affairs have been beautifully settled by a long time federal farm loan on the amortization plan.

This action on the part of the Commonwealth Club strikingly resembles the experience of a San Diego County friend of mine some two years ago. He was much interested in mutual fire insurance and finally wrote to an old acquaintance in Orange County, where a County Mutual Fire Insurance Company was in operation, and asked him to send information as to how to proceed to organize a mutual company in San Diego County; and the Orange County acquaintance flashed back a letter to him saying: "Place your insurance in the San Diego County Mutual which is organized, thriving, and doing a prosperous business." So many ranchers could send a similar reply back to the Commonwealth Club and with the questionnaire unfilled.

Judging then from the actions of the

Commonwealth Club, and from the article in the Cultivator, there are abundant reasons for feeling certain that both have somehow missed having knowledge of the great and beneficent movement that has now spread into almost every community in the United States and practically covers tbe state of California; and I shall, now present in the briefest way a few facts about this subject which I trust will throw some light uopn it.

The federal farm loan act became a law July 17, 1916. Early in 1917 the entire United States was divided into 12 federal land bank districts. The 11th district comprises the states of California, Nevada, Utah and Arizona, and the federal land bank for this district is located in Berkeley. The making of federal farm loans began in the summer of 1917 and has continued in ever increasing volume since that time. The Berkeley bank alone has received and acted upon 20,000 applications for these loans and has advanced to ranchers (mostly in California) over $16,000,000. The entire loans made throughout the United States now exceed $350,000,000, and the actual business is only just getting nicely under way.

Loans are made only through associations and the money is supplied by the federal land bank of the district. The membership in a national farm loan association may consist of borrowers from a single community or from an entire county. I myself am a borrower under this system, having had a loan allowed early in the summer of 1917; and I have also been the secretary-treasurer of an association ever since loans began to be made.

Federal farm loans are made on long time only, and the time is not less than five nor more than 35 years, and the borrower sets the time in most cases. During the first eight months the system was in operation the interest rate was five per cent, but when the sale of liberty bonds began to interfere with the sale of federal farm loan bonds the rate was increased to 5½ per cent, which is the present rate. That you may get an idea of the workings of an association I may tell you tbat I have had loans allowed for members of my association in excess of $400,000 to the present.

Kindly let me suggest that instead of the Commonwealth Club sending out the questionnaires you have described, that the club appoint a strong committee of its ablest members and have them cross the bay to Berkeley and hold a conference with the executive committee of the federal land bank of Berkeley. They will receive a tremendously cordial welecome from President Joyce, Secretary Ellis, Treasurer Evans and Registrar Cassidy. These men have been intensely on the job for 30 months and can throw a world of light on the matter that the Commonwealth Club is taking such a laudable interest in.

The whole federal farm loan system in this state will surely welcome the active cooperation and endorsement of the California Cultivator and the Commonwealth Club. or any other vital, moving force willing to assist in making still more successful this great movement for better farm finances.

Under the federal farm loan act, as now in operation, loans are made to the ranchers, actually at cost—that is, after the necessary running expenses are met any surplus goes back in dividends to the stockholders, which are the various national farm loan associations and their members, the borrowers. The federal land bank of Berkeley is already paying a six per cent dividend on all association stock, and most of the other 11 land banks are doing the same.

Federal farm loan bonds, based on the farm mortgages, are issued by the several federal land banks, and these bonds are speedily absorbed by the investing public, and the proceeds supply funds for additional federal farm loans.

I wish you would make such use of this letter as may in your good judgment seem fair and proper. I am mailing a copy to the Commonwealth Club, and another copy to the federal land bank of Berkeley. Believing also that there should be certain literature on your desk in connection with this subject, I am taking the liberty of mailing to you in a separate envelope the following: Circular No. 1 of this association; also one copy of the federal farm loan act; also the farm loan primer; also a copy of circular No. 7, entitled "Killing Off the Mortgages," giving information as to how amortization applies to federal farm loans.

And now, assuring you of my best personal regards, and also assuring you that in my estimation the Cultivator is a power for good in California, and trusting that things said in this letter will be read and received in the same kindly spirit in which it has been written, and trusting also that your own active support may be given to the present federal farm loan system as now in operation, I am, sincerely and truly yours, W. A. Van Loon.

COTTON IN EGYPT

Cotton growers will be interested in an extract from a letter recently received by Director Taylor from Dr. Forbes telling of cotton conditions in Egypt. Dr. Forbes was for over 20 years dean of the college of agriculture of the University of Arizona and is now carrying on studies with cotton and other crops in Egypt with the Societe Sultanienne D'Agriculture. Quoting from the letter which was written January 11, Dr. Forbes says:

"The cotton game is fully as exciting here as in Arizona, I think. Fully good fair Sakkelarides has sold recently for $1.15 a pound and Pilion for $1.20 per pound. These prices quoted are in Egyptian dollars, which normally are worth about the same as our own. Egyptian currency, however, is influenced by the value of the British pound, which in December was as low as $3.89 (U. S.) dollars as against $4.87 normal. In proportion, therefore, $1.15 Egyptian for cotton would amount to about 92 cents in United States currency.

"This is an unhealthy condition, of course, and surely must mean disaster in due time for someone in tbe line of buyers of cotton and its products. Next year's crop (1920) is now being sold by growers at 90 cents a pound (Egyptian) and the price is rising. This, of course, means that in the judgment of brokers they will sell for more than this next November. With an average crop of about 400 pounds an acre, and with labor costs far less than in Arizona, you can imagine that the fellaheen of Egypt are very comfortably well off just now and with pleasant anticipations of continued prosperity.

"The purchaser of cotton fabrics has no such feeling, however. Here in Cairo common long cloth is now 75 cents a meter, Turkish toweling $3.25 a meter and cotton voile $1.50 a meter. Articles of food, however, are much more moderate in price."

Place Your Order NOW for Nitrate of Lime

Guaranteed not less than 13 per cent Nitrogen—almost 100 per cent Pure.

Nitrate of Lime supplies Nitrogen in the most available form. Packed in solid wooden casks about 240 pounds.

Only Essex Shares Hudson's Qualities

They Show Why Essex Went 3037 Miles in 50 Hours

A critical public has judged the Essex.

In the year past it set a world's sales record.

More than $35,000,000 was paid for 22,000 Essex cars now in service.

That shows how men wanted what Essex offered.

Now Essex proves the accuracy of motordom's judgment.

Let the official tests speak:

On the Cincinnati Speedway a stock chassis Essex made a new world mark of 3037 miles in 50 hours, under observation of the American Automobile Association.

With other trials the same Essex ran a total of 5870 miles in 94 hours, 22 minutes driving time, averaging over a mile a minute.

Both Have This Motor Heat Control

Still another Essex phæton holds the world's 24-hour road mark of 1061 miles.

The Essex and Hudson are of course totally different types.

But note the advantages Essex shares with Hudson.

For instance, the radiator shutters by which efficient operating heat is maintained in coldest weather. They mean everything to satisfactory winter driving. Closed, they keep the heat in.

No unsightly hood covers are needed. They give summer efficiency to gasoline. They end hard starting. And in warm weather, opened, they give the maximum cooling.

The Performance Leaders in Every Community

The Essex, of course, does not cost as much as the Hudson, and though it is admittedly the runner-up in performance, it can never be all the Super-Six is.

In speed—in acceleration—in hill-climbing—in endurance—no stock car ever matched Hudson's famous records.

In every community you will find the two cars most noted for performance are the Hudson Super-Six and Essex.

Demand for both is so large that only by placing your order ahead can you insure delivery when you want it.

Essex Motors, Detroit, Michigan

Heider

15 to 20% Fewer Parts
More Power for the Pull

Heider Friction Drive does away with clutch, transmission gears and bevel gears. All three units are in one. With fewer parts to run, more power is put into drawbar pull or belt work. Steady, flexible power under perfect control.

No Gears to Strip

No transmission gears means no gear stripping. Fewer parts—less wear—longer tractor life. Seven speeds forward and reverse for tractor and belt work, all with one motor speed and one lever. Easiest to operate.

12 Years Actual Field Work

2 Sizes: 12-20, 9-16

Send for catalog. See what Heider users say. You do not have to take "demonstration" of one or two days as proof. Catalog also describes famous Rock Island CTX Tractor Plow, and one-man Tractor Disc.

POULTRY

Wholesale prices are:

Leghorn, 41@43; small, 41@43; large, 41@43; roosters, young, 43@45; old, 23@25; broilers, 45@50; fryers, 50@54; turkeys live, 42@43; dressed, 51@52.

Ducks, Indian Runner, 25@27; Pekin, 33@35; geese, 30@32; Squabs, 70@75.

Belgian hares, live, 20@23; Jack rabbits, dozen, 1.50@3.50.

LIVESTOCK

Western Meat Company are:

Cattle—Grass steers, No. 1, weighing 1000 to 1200 lbs., 12@13½; do 1200 to 1400 lbs., 11½@12; do, second quality, 9½@10½; thin, 8@9.

Cows and Heifers—No. 1, 9@9½; second quality, 8@8½; common to thin, 4½@5.

Calves—Light weight, 12½@13; medium, 11@11½; heavy, 9@9½.

Hogs—Weighing 100 to 150 lbs., 15; 150 to 225 lbs., 15½; 225 to 300 lbs., 15; 300 to 400 lbs., 14.

Moran & Co. quote prices on livestock, weighed and delivered off cars at their plant, South San Francisco, as follows:

Cattle—Good steers, 1000 to 1100 lbs., 11½@12; top steers, 1100 to 1200 lbs., 11@11½; good heifers, 1000 lbs. and over, 9@9½; No. 2 cows, 1000 lbs. and over, 8@8½; canner cows, 5@6; good bulls, 6@6½.

Calves—Light, 13@14.

Hogs—Top packer, hard and well finished; 100 to 150 lbs., 15; 150 to 225 lbs., 15½; 225 to 300 lbs., 14½; over 300 lbs., 14; under 100 lbs., 14.

Sheep: Ewes, 9@9½. Wethers, 11@12. Yearlings, 13@13½. Milk Lambs, 14@15.

POTATOES

Wholesale selling price:

Per 100 lbs.: Rivers, fancy, 4.75@5.00; choice, 4.50@4.75; Idaho Gems, 4.50@5.00; sweet, 4½@5 per lb.

ONIONS

Wholesale selling price:

Onions: Fancy brown, 4.50@4.75; choice, 1.25@4.50; yellow, 5.00@5.25; white, 5.00@5.25. Garlic, China, 14@15; other, 30@35.

VEGETABLES

Wholesale selling price:

Artichokes, No. 1, 90@1.00; No. 2, 65@80; No. 3, 40@55.

Asparagus: lb., 25@35.

Beans: So., 13; Hothouse, 35 lb.

Brussels Sprouts: lb., 8@9.

Carrots: sk., 1.00@1.35.

Cauliflower, doz., 1.25@1.45.

Cabbage, doz., 40@50; lb., 2½@3.
Celery, doz. bunches, 45@50; cr., 5.00@7.00.
Eggplant, lb., 15@20.
Lettuce: cr. 1.50@1.65; Imp., 1.65@1.90.
Peppers, Bell, lb., 20@25; Fla., 25@30.
Peas: lb., 10@12½.
Radish, 7@9 doz. bunches.
Tomatoes: Southern, 1.25@2.00.
Spinach, lb., 2½@5.

DECIDUOUS FRUITS

Apples: Bellflowers, 1.25@1.50; Newtown Pippins, old stock, 1.25@1.50; California storage, 4-tier, 2.00@2.25; Oregon, 2.00@2.50; Spitzenberg, choice, 1.75@2.25; fancy, 2.50@3.00; Baldwins, 1.75@2.50; Winesaps, fancy, 3.75@4.00.
Bananas: lbs., 8@10.
Pears: bx., 1.50@4.00.
Pineapples: doz., 3.00@5.00.

HONEY

Extracted jobbing prices: Water white and white, 18 and 20 per lb.; light amber, 16@18; amber, 14@16½; comb, 25@28 for white and water white and 20@22½ for light amber.

RICE

The California market remains quiet, with few sales. Spot fancy is available at $12 and futures at from 10 cents to 25 cents higher.

BEANS

Jobbing price per cwt.: Small white, $6.50; large white, 6.00@6.50; cranberry, 7.00@7.25; red Mexican, 8.50; pink, 6.75@7.00; California Bayo, 9.25@9.75; blackeye, 7.00@7.50; red kidney, 12.00@13.00; lima, 13.25@13.50; Garvanza, 9.50@10.50; Kotenashis (in bond), 5.35.
Dried Peas—California, 5.25@5.40 per cental for green, recleaned.

HAY

Under date of February 28, Scott-Magner & Miller says:

Receipts past week, 1,596 tons. Much has been used for double compressing on government shipments. This with better local trade and heavy country demand (many cars having been reshipped after arrival in this city to country points), has made a market condition never before known in this business. Owing especially to the heavy country demand, prices have reacher figures never known to the trade heretofore. Even at these abnormal prices, heavy trading seems to continue as feeders must have hay to maintain their stock, there being practically no grass available. Government was in the market during the week for 2,000 tons of hay, most of which was awarded to San Francisco bidders at exceptional prices. Large quantities of alfalfa have been moved from Nevada to this state with the natural result that prices in that state have also become much stronger as the stocks on hand there decrease. The lack of rain in any quantity is proving a most serious matter throughout the state, both as to crops and power; the water table throughout the state being lower than ever known before.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses are to be added according to conditions:

Fancy Wheat Hay (light 5 wire bales) .....38.00@41.00
No. 1 Wheat or Wheat and Oat Hay .....35.00@38.00
No. 2 Wheat or Wheat and Oat Hay .....33.00@35.00
Choice Tame Oat Hay .....37.00@40.00
Other Tame Oat Hay .....33.00@37.00
Wild Oat Hay .....Nominal
Barley Hay .....Nominal
Alfalfa Hay .....32.00@37.00
Stock Hay .....29.00@32.00
No. 1 Barley Straw, per bale.. .70@ 1.00

Citrus Markets

Los Angeles, March 3, 1920.

Navels continue in keen demand. Large offs are not chosen as quickly as smaller sizes but even for them fair prices are maintained. F. o. b. prices, where made, will vary all the way from $3.50 for large stuff up to $5.75 for 150's and 176's with smaller sizes the favorite.

With the influenza abating somewhat and enormous number of foreign lemons afloat and early arrival expected the lemon market is somewhat easier. However, some auction sales are made around the $6 and $7 prices.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 8,431 cars; lemons, 1,951; total, 10,385. To same date last season: Oranges, 8,316; lemons, 2,334; total, 10,650. From Central California this season: Oranges, 3,557; lemons, 235; total, 3,792. To same date last season: Oranges, 2,230; lemons, 234; total, 2,464. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

Additional Liners

TURKEYS

For Sale—Turkey Eggs, Mammoth Bronze and Wild Domestic, crosses; raise more poults, introduce wild blood into your flock. Get hardy, vigorous poults. With each order we send you formula for raising close to 90% of those you hatch and special feeding instructions. Will be worth many dollars to all turkey raisers to know the real way. Pamphlet tells you all. The WILD & DOMESTIC Turkey Home, R. D. Box 26 A, Hemet, California.

Giant Bronze Turkey Eggs for hatching from the famous Gold Nugget strain. Range raised, insuring strong poults. Phone city agent Lincoln 333. Mrs. A. H. Alken, R. F. D. 13, box 315. Los Angeles.

Thoroughbred Mammoth Bronze Cockerels and Tom Turkeys. Also Bronze and Mammoth Bronze Eggs. April and May delivery. Robinson Turkey Ranch, San Dimas, California. Covina Phone 902.

Mammoth Bronze Turkey Eggs and Toms —"Gold Nugget" strain Toms, $15.00. Order for March delivery now. Carrie Andrews, Hemet, California.

BOSTROM IMPROVED

Shipping weight 15 lbs. **Price $22.50**

Has TELESCOPE with magnifying glasses which enable you to sea cross on Target quarter of a mile. Pays for itself on the first job of

IRRIGATING, DITCHING, TILE DRAINING, TERRACING, etc.

Best Investment any land owner aver made with Twanty-Two Dollars and Fifty Cents. Simple, accurate, durable and completa with full instructions. Used and andorsad by Agricultural Schools, County Demonstration Agents, and farmers from Atlantic to Pacific, and you will endorse it too, after using it—if not your money back.

Write for description of Level and TELESCOPE, details of money back guarantee; also name and address of our distributor in your section.

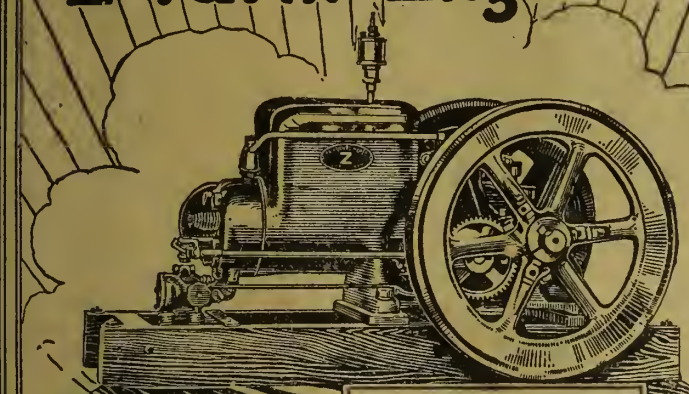
Fairbanks-Morse "Z" Farm Engines



OVER a quarter-million modern farmers know and use the best engine. Surely in their wise choice there is a message that vitally concerns you, also.

Such widespread acceptence of the Fairbanks-Morse "Z" Engine was not achieved by claims alone. Nor by the high repute of the house which manufactures this phenomenal farm engine. Over $15,000,000 was paid by farmers for "Z" Engines because of *Quality* which makes for service—and *performance*—and *surplus power*—and *enduring farm engine dependability.*

Magneto ignition service from more than 200 Bosch Service Stations. And thousands of "Z" dealers furnish Fairbanks-Morse service to every engine buyer. See your dealer today.

FAIRBANKS-MORSE QUALITY F M 100%

Prices: 1½ H. P. $75.00, 3 H. P. $125.00, 6 H. P. $200.00. All F. O. B. Factory.

THE

BEARCAT

Wormdrive—Dust Proof
Orchard and Farm Tractor

SPECIFICATIONS:

H. P.—10 on drawbar. 20 on belt pulley.
NORMAL DRAWBAR PULL—3,200 lbs.
TOTAL LENGTH—118 inches.
TOTAL WIDTH—63 inches.
TOTAL HEIGHT—52 inches.
WEIGHT—4,200 lbs.
MOTOR—Galloway—4-cyl., 4¼ in. bore, and 5½ in stroke. High duty. Slow speed.
SPEED OF MOTOR—900 R.P.M.
MOTOR BEARINGS—Very Large. All are bronze backed, babbitt lined.
GOVERNOR—Galloway. Enclosed fly ball running in oil and on ball bearings.
FUEL—Distillate, Kerosene or Gasoline.
CARBURETOR—Holley, 1¼ inch.
FUEL TANKS—One 15-gal. and one auxiliary tank of one gallon capacity.
AIR CLEANER—Bennett dry air.
RADIATOR—Perfex, 8-gal. capacity.
WATER PUMP—Centrifugal, 450 R. P.M.
COOLING FAN—Oakes. High duty.
IGNITION—Dixie high tension—impulse starter.
CLUTCH—Borg and Beek, dry plate.
TRANSMISSION — Enclosed sliding gear, three speeds forward, one reverse; gears high-speed steel.
SPEED—Low, 1½ M.P.H. Int., 2¾ to 3 M.P.H. High, 6 M.P.H.
REAR AXLE—Full floating worm drive.
DRIVE WHEELS—Height 40 in. Face 10 in.
BEARINGS — Rear axle, Timken throughout. Transmission, Hyatt high duty. Front axle, Timken.
BELT PULLEY—8 in. diameter, 8 in. face, 900 R.P.M.
SUSPENSION—Three-point, mounted on spring in front to take all shocks.
WHEEL BASE—78 in.
TURNING RADIUS—10½ feet.
DRAWBAR—Special design for California; very wide; roller hitch can be used if desired.
STEERING GEAR—Gemmer irreversible, with 18 in. hand wheel. Spark and throttle control levers directly under wheel.
DRIVER'S SEAT—Situated on right of tractor; very convenient position for watching tools and work.

Holland in America

By Ernest Braunton

PLANTSMEN in the United States have always been puzzled in the growing of bulbs and plants usually imported from Holland and Belgium. Of course, labor costs less in the latter countries and this has been a strong factor in discouraging American production. But soil and climatic conditions also enter and the Dutch seem to have the best of it. The climate "over there" is damp, what we could call coastal, and of all states touching the big oceans, California has the driest climate during summer. So it was generally accepted that ours was the least fitted to compete with Holland in plant and bulb production.

But some courageous soul noted the splendid development of Dutch bulbs about Santa Cruz and there began a series of experiments that has expanded the trial gardens into thousands of acres where fine bulbs and truly marvelous flowers are grown, especially of narcissi; flowers not surpassed in size, color and substance. Plants of heath, camellias, etc., did not thrive to the same extent. So when large capital was seeking opportunity along these lines in California it went to the far north, the San Francisco—Santa Cruz section was scarcely more considered than the Los Angeles district, thtough the latter had duced good freesia, calla, and a few other bulbs.

But the far north has not proven altogether ideal, and now it has been determlned that peatlands or the coastland benches next above the peatlands, are ideal for many plants plants heretofore imported. These importations are no longer possible, for quarantine regulation No. 37 bars out all finished products, or those ready for planting in the garden. It encourages home development of such stock and will allow seeds and scions of new, rare or highly desirable plants to enter to be grown and multiplied here.

In the Santa Cruz section, not far from San Francisco, and in the peatland district of Los Angeles, lying largely in Orange County, there are springing up fields of ornamental plants of sorts heretofore never grown in California, some of them on a large scale.

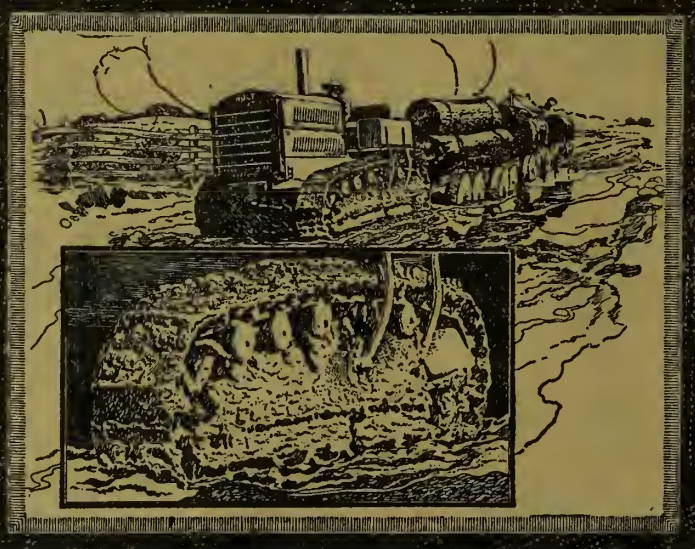
One man of 30 years' experience in handling imported plants each year has just received a shipment from Japan of 30,000 dormant roots of aspidistra lurida, an ornamental foliage pot plant always in heavy demand. It took the Japanese shipper a full month to assemble such a large order of one sort, drawing upon all parts of the islands. The cargo laid down in California cost $8,000 and there were but 74 boxes of a size easily handled by one man. A special permit from the United States government was necessary for their entrance.

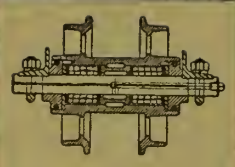
The plants will be grown both in lath houses and in the open fields, in a soil that is decidedly peat and nothing else. It is as black as the darkest night and as fine as corn meal. It has been cropped and weathered for 40 years and is therefore decomposed peat. Its value is far in excess of that of raw peat in that the latter is not decomposed and therefore its plant food is not available. The decay of raw peat is slow and it is not readily nitrified. Those seeking the use or purchase of such lands will do well to acquire those in use for many years, that have been plowed deeply, pulverized and weathered. The writer lately saw a field that had been cropped with cereals for a quarter century and the surface was as black and fine as soil could be. Part of the field was plowed very deep and turned up two or three inches of pure compressed tules and tule roots that was nearly as "indigestible" to the soil as an equal amount of cork. It must be manifest to all with any considerable amount of experience in that line that such material will not become a true soil in several years and it must become partially decomposed before its value as a humifying soil amendment can be recognized. But the peatlands of California that have undergone years of preparation will in the next few years doubtless give us plant gardens that would make a Dutchman homesick for his native land.

PORTLAND CEMENT

Preliminary estimates compiled by the United States geological survey indicate that the production and shipments of Portland cement in 1919 increased 13 and 21 per cent, respectively, over those in 1918, and that the stocks decreased 52 per cent, so that at the end of 1919 less than 5,000,000 barrels of Portland cement was in stock at the mills. The Portland cement industry was set back considerably in 1918 when war restrictions reduced the shipments from the 90,703,474 barrels shipped in 1917 to 70,915,508 barrels, but it is now regaining its lost ground. Early in 1919 the business was even poorer than in 1918, and practically all the increase reported was made during the latter part of 1919, so that 1920 started with favorable prospects for the cement industry. During 1919 the shipments from some mills were limited by the lack of freight cars. The increase in the value of the cement shipped in 1919 over that shipped in 1918 was about 28 per cent.

HYATT
ROLLER BEARINGS





Cross Sectional View of a Track Roller in Creeper Type Tractors Showing Application of Hyatt Roller Bearings.

In this position the hollow spiral roller construction of Hyatt Roller Bearings provides many distinct advantages.

Only a bearing of the Hyatt type can stand up and give permanent performance under the gruelling conditions of track roller operation.

It is because of these many peculiar advantages that Hyatt Roller Bearings are just as permanent as the shafts upon which they operate.

The Hardest Service in the World

Forcing their way through mud, muck, sand or water —going over all obstructions and supporting the tremendous weight and pull of this giant tractor and its load, the track wheels of the "creeper" type tractor endure the hardest service in the world.

And, at the point of severest wear in these track wheels, Hyatt Bearings are installed.

Ten years ago, Hyatts were first used in this application. Many of these old machines are still in operation, and in them Hyatt Bearings have given ten years of constantly dependable, permanent service.

Ten years' use under the most severe working conditions known in the tractor industry, without ever requiring adjustment.

There can be no greater proof that Hyatt Bearings should be in your tractor, truck, thresher, grain binder, plow, windmill and other farm machinery.

Legal Queries

Louis R. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Road on Half Section Lines

Is one obliged to give a road on half section lines? This land is just being settled and there are very few permanent roads established.—Subscriber, Lucerne Valley.

The only provision in the federal laws is that a right of way for the construction of highways over public lands not reserved for public uses is granted. The courts in construing this statute have held: where a settler has entered public lands, he has a vested right to the whole of the land entered and upon obtaining patent becomes vested with full ownership which relates back to the time of the original entry. In case any roads were provided along the half section lines, such would have to be reserved at the time of entry. The county supervisors of course may order roads to be opened, but in such cases they are required to pay compensation to the owner of the property over which the road is opened.

Mortgage on Wyoming Property

Owner of property in Wyoming and California died prior to the war, leaving two sons who were taken for overseas service. There was a mortgage upon the Wyoming property, but the administrator handling it refused to pay the mortgage and has given no account of his part of the estate. The administrator of the California property has paid a portion upon this mortgage. What can be done to assist the heirs?—Subscriber, Chino.

It would seem that the federal moratorium act would apply as invoked upon the Wyoming property, in which case the property could not be taken for at least six months after discharge from service. The property here could be sold under order of the court and the mortgage upon the Eastern property paid, leaving it clear. These are all of course, mere suggestions which more careful examination of the facts might alter.

BEET SUGAR INDUSTRY

(Continued from Page 377.)

tries millions of bushels of wheat, grain, corn, cotton seed, etc., which are rich in plant food, such as nitrogen, potash, phosphoric acid, and are importing millions of tons of sugar, which does not contain one ounce of plant food.

Some years ago one of the professors of the University of Gottingen, in Germany, lecturing to his students on agricultural economics, stated that for every million bushels of wheat they purchased from America there was 1,575,000 pounds of plant food, which at that time represented 25 per cent of the price they paid for the wheat.

The United States today has only 99 factories in operation. I stated before that we were producing 23 per cent of what we consume. If we would produce what we consume it would require about 400 more factories, which would mean that we would have 500 factories in operation.

If we compare the total area of Europe with that of the United States, we find that the United States has an area of 2,970,000 square miles, not including Alaska, while Europe has an area of 3,850,000 square miles, or is approximately one-fourth larger than the United States.

If our beet sugar industry were developed in ratio to the areas, we would have approximately 930 factories in operation, or nearly ten times more than we have today.

The mere fact that we are sending over $400,000,000 out of the country for a product which we could produce ourselves does not signify so much until we begin to analyze how this money would have been distributed among our own people had we produced this sugar ourselves.

Supposing this sugar was made from beets, say containing 15 per cent sugar, at 12 tons of beets per acre, while the factory would have an extraction of 83 per cent. Then for every ton of sugar we require eight tons of beets, or a total of 16,800,000 tons of beets produced on 1,400,000 acres of land. This would mean that the sugar companies would pay the farmers $168,000,000 for beets; the farmer pay his laborers for preparing the soil, planting, cultivating and harvesting his crop, $90,000,000; while the farmer would have about 4,000,000 tons of beet tops left on his land after the crop was removed, which represents a valuable cattle food after it has been properly siloed. This would feed and fatten some 2,000,000 steers for 120 days.

The factories would be paying, during a campaign of approximately 100 days, $20,000,000 worth of labor in the factory for producing sugar from beets, $13,000,000 worth of coal, $20,000,000. to the railroad company and $47,700,000 for miscellaneous items such as coke, lime rock, bags, maintenance and repairs.

If these factories would have pulp drying plants such as all modern factories have, they would produce 840,000 tons of dried pulp, which is also a very valuable cattle feed and would represent a value of approximately $27,000,000. In order to produce this 840,000 tons of dried pulp the sugar company would spend in the neighborhood of $3,000,000 worth of labor. Approximately $113,000,000 is paid out for direct labor. If we consider the turnover of this amount alone, we get figures that would astonish us.

It is the money put in circulation by the sugar companies and farmers for labor and materials that pays for harbors, highways, schools, churches, and supports our universities and makes it possible to further develop our lands, railroads and allied industries.

VALUE OF MANURE

In an address before the El Modena, Orange County, farm bureau center, Dr. S. S. Twombly of Fullerton discussed stable manures and referred to tests made of a large quantity bought by one orchard owner in that county during the last 12 months. From the analyses made of these manures Dr. Twombly finds:

"Laboratory analysis showed an average as follows: Forty-four per cent water, 880 pounds per ton; 15 per cent organic matter, 30 pounds (including shavings and straw); 40 per cent waste; 800 pounds actual dirt and lifeless material; six-tenths of one per cent nitrogen, 12 pounds per ton.

"Valuing nitrogen at 25 cents per pound would bring the average nitrogen content of average manures to $3 per ton.

"Dairy manures, generally heavy and green: Fifty-six per cent water, 1,120 pounds per ton; 24 per cent organic matter, 480 pounds per ton; 18 per cent waste, 360 pounds per ton; seven-tenths of one per cent nitrogen, 14 pounds per ton.

"Inasmuch as the general farm practice in the citrus grove is to irrigate and cultivate heavily, both factors involving the loss of nitrogen and organic matter in the soil, we must pay special attention to returning these elements to our soils by judicious manuring and cover cropping.

"Considerable loss of nitrogen through ammonification from the manure pile as it accumulates may be averted by the use of acid phosphate, working it into the pile. This absorbs large quantities of the ammonium before it escapes."

IN FRANCE

"The American sugar industry hardly realizes in what a pitiable condition the French industry is at this time," writes the editor of Sugar. "Stories to the effect that only 51 factories have been operating during the past season do not seem to convey a true conception of the situation as it actually exists. But when it is stated that, for instance, in 1901-2 the production of refined sugar was 1,052,000 metric tons, in 1912-13 877,600 tons, and in 1918-19 only 110,000 tons, or almost exactly ten per cent of the 1902 production, then we begin to realize what the war has done to the French beet sugar industry.

"One hundred and fifty sugar factories in France are either in ruins or their machinery has been depleted to such an extent as to make active working in the next two years out of the question. In addition, the fields have been showered with a rain of shells, many of which failed to explode and buried themselves deep in the ground, invisible to the eye of the tiller of the soil.

"Last spring several beet sugar factories made attempts to arrange with farmers to raise a new crop of beets on the shell destroyed area. A number of deplorable accidents resulted when the plows struck the unexploded shells and blew the farmer with his team to pieces. Now an order has gone out that no more plowing or tilling is to take place on the former battlefields until the military authorities have gone over the ground foot by foot with delicate magnetic instruments, mounted on rubber tired wheels, which will indicate the position of shells buried underneath the surface. This means a delay of several years, for it will take at least two years to carry out this new program of 'Safety First.'

"This, it is needless to say, is one of the factors which the American sugar industry has not considered seriously enough during the past year. It means that France will be, for three or four years longer, a heavy purchaser of foreign sugars, instead of being able to export some of its own, or at least satisfy its home demand.

"Fortunately, the sucrose content of the beets does not seem to have suffered very greatly. The percentage still runs at 11.53 for the present year and 12.54 for the past year, as compared with 13, which was the highest percentage ever reached in France during the year 1912-13."

PUT IN A CORK

Pat went to a druggist to get an empty bottle. Selecting one that answered his purpose, he asked: "How much?"

"Well," said the clerk, "if you want the empty bottle it'll be five cents, but if you want something put in it we won't charge anything for the bottle."

"Sure, that's fair enough," observed Pat. "Put in a cork."

"Thankful! What have I to be thankful for? I can't pay my bills."

"Then, man alive, be thankful you aren't one of your creditors."—Boston Transcript.

A Quality Combination

THE **International 8-16 Kerosene Tractor** is a tractor of character and personality. The first note of appeal is the graceful, trim design, the general compactness and the good balance of the tractor, with just the right distribution of weight on the front trucks and drive wheels. The next thing that strikes you is the absence of exposed working parts; everything is enclosed as protection against the grinding action of dust and dirt.

And you are impressed by the flexible range of the drawbar, making it possible to pull a harrow, plow, binder or wagon with equal advantage and by the convenient pulley so placed that the tractor can be backed into the belt in a hurry, with no chance for the belt to drag on the ground or rub against any part of the tractor.

And coming down to more technical but nevertheless very important details — there is the throttle governor that regulates the fuel to the load; removable cylinder sleeves in the engine so that if a cylinder should become scored through the use of poor lubricating oil, for instance, a new lining can be put in at once, renewing the cylinder; centralized auto-type control, making this tractor as easy to handle as an automobile.

These are only a few of the desirable characteristics of the **International 8-16 Kerosene Tractor.** The catalog that we have ready to mail you will give you the rest. Or, see your International dealer and examine his sample 8-16 for yourself.

When the Chick Comes From the Shell

its intestines are infected with bacilli, inherited from the breeding stock.

LACTEIN

CONDENSED

Buttermilk

will positively overcome the germs and bacilli—will build strong, healthy chicks—will cut down the loss from disease and sickness.

LACTEIN condensed BUTTERMILK is not an experiment, but a scientifically compounded food and tonic for chicks.

It is a process of manufacturing that retains all the food and tonic elements in sour milk and buttermilk—thoroughly pasteurized and the Lactic acid stimulated and developed to the highest degree.

Lactic acid is the most valuable element—it kills all germs, keeps the system clean and purifies the blood.

Lactein condensed buttermilk will INCREASE your percentage of chicks you raise.

It is MOST ECONOMICAL to feed—easy to handle—does not sour and IT PRODUCES RESULTS!

Condensed Buttermilk

Brooding With Sunshine

By Jean A. Koethen

THIS little story of my own experience will not interest the poultryman who broods a thousand chicks or more at once, but it may help some farm woman who has little money and no equipment. A good many poultrymen are finding out that chicks, after the first critical four days, need less heat than they had supposed. Only this morning I received a letter from a poultryman of 45 years' experience (Think of that, you novices, who think you can learn it all in a year!) saying: "I don't know it all yet. After spending years of time and hundreds of dollars learning to brood with artificial heat, I discarded it all for fireless brooders, and it may be interesting to you to know that I have done my own hatching and raised 100 per cent." This man began his chick raising with their mothers, culled in the henhouse, then culled again in the incubators, then, he says, "I just came Luther Burbank on it, so that those that went into the brooders all lived, and that was in lots of two and three thousand chicks. Fireless brooders, open front brooder houses, skimmed, scalded milk, sprouted oats, watercress, wild turnip, commercial chick feed and dry mash, and R. I. Red pullets have laid in four months to a day. They had exercise in plenty. Did I force them?"

My story about 35 chicks will seem very tame to this man, but very few farm women raise their chicks by the thousand, and if they did the principle is the same—plenty of heat at first, fresh air, sunshine, exercise, room to grow in, absolute cleanliness, simple fare and sufficient, just plain common sense, that is all—but they all lived and grew like weeds, and even those that seemed a trifle runty at first blossomed out into fine, thrifty prospective layers. Chicks treated in this way do not have leg weakness nor do they stand around and droop. They are too busy, perhaps.

They came from the incubator Monday, the 26th of January, just three and a half weeks ago. My outdoor brooder went to the junk heap years ago. Like Mr. Severance, I found I could do better. No hen was available and so I had prepared two boxes for the reception of my brood. The one shown in the picture, which was to be my brooder coop, is a common grocery box, 18 inches by 24 by 27, which I bought for 25 cents. A smaller box, 10 by 10 by 16, with a door cut in one side, was my brooder. A soft nest of straw covered the bottom and was drawn well up into the corners and the hover was just a piece of old comfort, with the cloth carefully removed. The importance of this precaution I fully realized when I came out one morning and found the huskiest chick in the bunch strangled by a raveling. The regular Philo brooder quilt is made of cotton batting and cheesecloth, all clean and new, but if one has an old comfort it can be made to answer the purpose nicely. It should be large enough to rest on the chicks' backs in the middle, while the edges hang well over the sides of the box.

The ventilation of these little brooders is always a problem. I have found that when the chicks are first put in the best way of providing air is to turn back one corner a tiny bit. After the first week leaving a small opening at the door answers better, for the chicks will climb out over the top if there is any opening. I find a piece of brick slightly smaller than the door makes a very good way of closing it, and the little crack around it gives the chicks what air they need. When the Philo brooder is used the quilt is tacked to a frame made to fit so loosely that the air comes in around it, and the frame rests on a cleat. It is quite a job to fix one of these quilt frames neatly. That is why I used the old comfort.

The chicks were put in the brooder box about noon and were left there to rest quietly till about 4 o'clock, when they came out into the coop and picked up bits of sand and grit and a few of the steel cut oats I had scattered over the sand. Then they were gently pushed back into the box and left till morning.

I ought to explain here that my plan aimed at the use of sunshine to the utmost. Our place is on a rather steep southern slope, and the garage in which I brood the chicks opens toward the south. When its westerly door is thrown back it catches the first rays of the morning sun, and it was against this door that I set the coop the first thing in the morning. Before the sun was in sight I set a jug of hot water in the coop, but as soon as the sun was well up in the sky, its heat, reflected from the door and caught also by the back of the coop, gave abundant warmth. Those first days I kept a large pane of glass over the front of the coop. When the sun had passed so far to the south that its rays no longer entered the coop directly, I drew it back into the garage and faced it south, so that it caught the sun until nearly four o'clock.

Hunting for Worms

These three weeks old Reds are scratching for worms in the freshly turned earth. When their crops are full they rest a little, then begin again on grass or bran.

In Loco Parentis

The woman who undertakes to mother a brood in a fireless brooder has her work cut out for a few days. Notice the hen hovered brood. The chicks venture out a little, then slip back under her wings. When they are all warm and comfy, out they go again. Her clucking calls them back to warm up, and so it goes all day. Those first three days I put myself in place of the hen, letting the chicks out for a little while to eat, then pushing them gently back into the brooder and leaving them there a while to rest. When the sun was hot I could leave them out longer, and in early morning and late afternoon I found my jug of hot water saved me a lot of trouble. I still give them their jug dark mornings, and today, the first really rainy day since they were hatched, they have had it all day. For some reason I never succeeded in teaching this brood to go in to their

brooder to warm up. This I think was because the coop was smaller than it should have been and I was obliged to take the brooder out during the day.

After three or four days, as the weather was warm, I added my third piece of equipment, a little run, three feet square and about 12 inches high, made of shakes on three sides and wire on the fourth and covered with wire. This run was used either inside the garage or outside, according to the time of day, and its wire front let in all the sunshine. When the coop stood before the door in the morning the run in front of it was almost as warm as the coop itself. If the afternoon was cool I put a board over the wire and kept out all the wind. My aim, and my only aim, has been to keep the chicks comfortable. One can always tell by their looks and the sounds they make whether they are comfortable. If they are not, warm them up, if you have to put them to bed every hour or fill every jug and jar in the house with hot water.

Sleeping Room Essential

At first the chicks were put in their brooder at 4 o'clock, but as they grew they demanded to stay up a little later, and I tried to please them. Often I put them in at 4 o'clock and let them out again to fill their crops before finally tucking them away for the night. By the end of the first week they had outgrown their first brooder, and I gave them one a little larger. Before the end of the third week they were using both boxes. I have aimed to give them room to lie down. When chicks are so crowded that they must stand they cannot rest. One can always tell by putting the hand into the brooder after the chicks have gone to sleep whether they are resting comfortably. Every day the brooders are hosed out and dried in the sun and clean nest litter supplied.

Diet of Worms

It is not my purpose here to discuss chick rations, except to say that mine have been fed very simply on rolled and steel cut oats the first week, then commercial chick feed, bran, milo and Egyptian corn and cracked corn as soon as they would eat it, greens and worms. It has been a standing grievance with me for some time that my hens would not eat worms, and I resolved to train this brood to eat their natural food. When they were a week old I began throwing a few worms now and then in to their run, mainly to give them exercise. At the end of two weeks when they were let out of their small run for a while daily, I began spading a little several times a day and letting them help themselves to the worms which are unusually plentiful this year. This, I must confess, has been as much fun for me as for them, and I am in constant amazement at the avidity with which a chick will put a three inch worm out of sight. I am forced to attribute their unusual growth and vigor to this daily ration of earthworms as much as to the interest and exercise involved. Today, wet as it is, I have filled them up twice, not because I wished to dig worms in the rain, but because the wretches demanded it, spoiled babies that they are.

Leg Weakness

Chickens raised in lamp heated brooder with bottom heat grew well, but one night lamps were not turned down and chicks not divided so that I found steam coming out of the ventilators and chicks panting for breath. None were dead and I put in dry floors and gradually cooled them off. They soon seemed all right and began to preen their feathers. That was last Wednesday night and they have seemed to be all right until today, four of them have developed leg weakness. I fed rolled oats and hard boiled egg ground with shell for first three or four days then a good scratch food and bran with some beef scrap and green feed (alfalfa and lettuce). Is it the fault of the brooder entirely or the result of the overheating? I have raised a great many on that feed and never had leg weakness. On account of bad weather they have been confined to the brooder house on a cement flood well sanded—Subscriber, Harper.

What your chicks need is more bone making material and more exercise on the ground. Exercise on any kind of floors isn't quite the same as getting out on Mother Earth's lap. The overheating may have hastened leg weakness, but close confinement has had as much influence. Don't think of giving them up. Just add five per cent bone meal to their mash and get them out where they can run. It would be better to make the mash half bran and half feed meal, with ten per cent beef scrap and five per cent bone meal. Most poultrymen prefer overhead heat to what you call "floor heat," arguing that it is on their backs the chicks need it most. Now that yours are a month old, they can soon be trained to do without artificial heat. Notice in last week's Cultivator how Cornele G. Ross weans his at three weeks.

Vent Gleet

You have answered some very perplexing questions, and now I am going to ask you for some information on a case that I have never seen or heard of in all of my many years of experience with hens. R. I. R. hens, which had vent gleet have developed canker around the vent, with the worst odor I ever smelled. It does not seem to bother the hens any, that is, they eat well and look in the pink of condition. As to their laying, I cannot say.—Subscriber, Hughson.

Vent gleet in its virulent form is a difficult disease to cure. Lewis Wright, the veteran poultry expert, recommends the following treatment: "Isolate all affected birds. Give 30 grains Epsom salts and twice a day inject first a four per cent solution of cocaine, and immediately afterward a solution of nitrate of silver, four grains to the ounce. The fifth day commence a small copaiba capsule daily, and inject acetate of lead, I drachm to the pint. Feed rather low meanwhile and dust any sore places outside with iodoform or aristol. If not well after two or three weeks, we would kill the bird, as the disease is not quite free from danger; for if the operator should touch his eyes accidentally before he has cleansed his hands, the result might be a most violent inflammation."

Inflammatory Rheumatism

Have a hen with red swollen legs and also her comb and under her bill is swollen. She appears to be healthy otherwise. What kind of a sickness do you call that, and what can be done for it?—Subscriber, Orange.

This looks like genuine rheumatism, and of the inflammatory variety. At the university farm I understand they paint the inflamed surfaces in such cases with tincture of iodine. Use a small paint brush or the tip of a feather and paint very lightly once a day for several days. Keep the bird in a dry sunny place and give a rather bulky ration, i. e., a ration containing a large amount of bran and greens.

Soft Shelled Eggs

This afternoon I noticed one of my Leghorn hens drop white of an egg enclosed in a soft shell and after walking about 20 feet farther, drop a perfect yolk. Can you tell me what caused this? Also please advise your price of the book, Poultry for Profit?—Subscriber, Sacramento.

Laying soft-shelled eggs is some-

Poultry Queries

Conducted by J. A. Koethen

Poultrymen Who Trapnest

Under the heading "Let the Buyer Beware," in your issue of January 31, 1920, you agreed to send names of some people whom you know trapnest White Leghorn chickens. I will appreciate it very much if you will send me such a list. What you said in your article is only too true.—Subscriber, San Francisco.

I have mailed you the names requested. It is not a long list, but I fancy it will be longer another year. Poultrymen are beginning to realize that pedigree counts tremendously. The Hogan system and other methods of picking out the hens that ought to lay or those that have laid heavily do not tell us what hens have laid the most eggs, and that is what we must know if we are going to breed a heavy laying strain.

Give them more power

To Control Excess Oil
A special ring for motors that pump oil. Use in top grooves of each piston. In the lower grooves use McQuay-Norris LEAK-PROOF Piston Rings for complete compression—power.

When your engine first shows signs of decreasing power, look to its piston rings. Make sure that none of the gas you buy is leaking past them. Make certain that all your gas is compressed and turned into power. Install the genuine McQuay-Norris LEAK-PROOF Piston Rings. They mean more power.

Their exclusive design insures equal action all around the cylinder wall. That's why they are the only piston rings of their kind. There's no such thing as a Leak-Proof type of piston ring. LEAK-PROOF is the trade-marked name of these particular rings—with ten years of severe service back of it. Be sure you get the genuine.

They are made in every size and over-size to fit every make and model of gas engine. Your dealer has them or can get you proper sizes promptly from his jobber's complete stock.

times due to lack of shell material in the ration, sometimes to fright or excitement and sometimes to overfeeding. From the fact that this hen dropped both the soft-shelled white and also the yolk, it looks as if there must have been some unusual excitement. In that case a few small doses of Epsom salts and care not to have the bird excited should be sufficient to prevent a repetition of the accident. Keep her away from the rest of the flock a few days and feed lightly, making sure that she has all the green feed she will consume. The price of "Poultry for Profit" is $1.00 postpaid.

Rheumatism or Tuberculosis

Can you tell me what to do for my chickens mostly White Wyandottes, pullets and cockerels? They become very lame in one leg, in some instances lose the use of the leg entirely. They seem to retain their appetites but grow thin. They have mixed grain, greens, "Surelay" for mash. I also give them "semi-solid" three times a week. They are housed in clean quarters and run during the day in the orchard. They also have alfalfa to eat. Please tell me what is the trouble?—Subscriber, Corning.

How many hens are affected, and is there any swelling in the joints or redness or soreness on the outside? These external symptoms usually indicate rheumatism, due to exposure or dampness in house or run. If there is merely lameness without any apparent inflammation, with good appetite and loss of weight, I should suspect tuberculosis. If, on killing one of the birds, you find liver, spleen and intestines studded with white cheesy nodules of various sizes, you have reason for concern. Tuberculosis can be positively diagnosed only by a microscopic examination or by the tuberculin test, but these yellowish cheesy nodules are found in nearly every case. In some other liver diseases there are white spots or blotches on the liver. In tuberculosis the spots are raised nodules. If you find such spots, kill every affected bird, and if possible, move the rest to clean soil. If you do not find them, you are justified in concluding the disease is rheumatism, which can be cured only by removing the cause and keeping the birds in dry, well ventilated houses on well drained ground.

Don't expect great success in hatching and raising chicks unless you have some experience, or at least an observing eye and a willingness to do as those who have been successful.

Nature teaches us that fowls should have a wide range and that a farm is the best place for them.

Having movable, separate nest boxes makes it easier to clean them as well as the house.

It is almost impossible to give laying hens which are confined too much exercise.

HENS HELP BOYS IN COLLEGE

New honors are due "Biddy," the barnyard fowl, since 225 of her have pooled their efforts and are helping put three Connecticut boys through agricultural college. The hens, which now reside not far from the college, are doing a mighty good job, for the boys know how to care for them. In fact, the boys' interest in college, and hens as well, goes back to their membership in the Goshen Poultry Club, one of two organizations that engaged in a contest intended to show what intelligent care can do in raising poultry.

It was a Marathon race, so to speak, that lasted over a year, the finish taking place last October. And it was a race for real money, $1,000 being the prize. Strangely enough, both sides won. A net profit of $1,000 from each group of hens in a period of one year was the goal set for each club, and both groups cleared considerably more than that amount. Eleven boys living near Goshen (including the three now tending their flocks while going to college) constituted one club, and the other, known as the West Hartford Poultry Club, was composed of boys living near Hartford. The unique contest was suggested by the state club leader of Connecticut, who had the cooperation of the poultry extension specialist of the agricultural college.

In a sense each club was racing against time to see if its hens, which aggregated approximately 400, could be made to produce $1,000 profit in a year. Naturally also there was rivalry between the two clubs to see which would make the biggest showing. Both clubs held monthly meetings at which each boy reported regarding his flock the number of hens, the number of eggs laid, the amount of scratch feed and dry mash used. More than one boy received kindly but pointed criticism of his methods when reports showed poor egg production. At the close of the club year the West Hartford club had made a profit of $3.92 a hen, while the Goshen club did even better, with a profit of $4 a bird. Thus each club surpassed its goal by a wide margin.

Inspired by this success, the three Goshen boys have gone to college, taking their hens with them. The birds, all of which were raised last summer by club members, have been true to their trust, laying eggs more prized than the golden variety laid by the legendary goose.

Bran is a good regulator for poultry of all ages.

Purchase well matured pullets rather than hens.

THE ONLY DIFFERENCE

A crabby millionaire as he climbed out of his limousine was approached by a newsboy. "No, I don't want any paper. Get out," he snarled. "Well, keep your shirt on, boss," replied the newsboy. "The only difference between you and me is that you are making your second million and I am still working on my first."

Life is made up of two currents—the events and opportunities moving toward us, and the thoughts and impulses that we send out toward others.

POULTRYMAN'S CALENDAR—MARCH, RAISING THE CHICKS

On commercial poultry ranches hatching will be finished by the end of March. On many it is practically over by the first. The poultryman who buys his chicks gets them in February if he can. In March the growing chick has the right of way. The baby chick's first requirement is warmth. The growing chick's first requirement is room to grow in; its second, and many experts would place this first, is proper food.

Thin out the brooder chicks and give them all more room by the end of the third week. Get them out onto the ground if possible. Green range makes up for many defects in feeding.

A good growing mash for Leghorn chicks consists of 2 parts fine wheat bran, 1 part middlings or low grade flour, 1 part corn meal, 1 part beef scrap, ¼ part oil cake meal. With this is fed a scratch ration consisting of 2 parts fine cracked corn, 2 parts sifted cracked wheat, 1 part hulled oats, 1 part cracked Milo or Egyptian corn.

For Rocks and Reds, when weight is desired, a successful breeder uses this mash after six weeks: 400 pounds corn meal; 200 pounds ground barley, 480 pounds bran, 160 pounds meat, 10 pounds salt.

Keep a vigilant watch this month for mites and lice. Dusting the chicks with any good louse powder will rid them of lice; painting their coops with kerosene and crude carbolic acid (1 part acid to 4 or 5 of kerosene) will keep mites away.

Household Department

SONG OF THE POPPIES

We come when Spring is young and fresh
And winds are sweet and mellow,
O're rain-drenched fields of tender green
We march in suits of yellow,
A fairy horde of merry men,
Our golden helmets gleaming,
Bright as the stars in midnight sky
Across the heavens streaming.

Our manual of arms was taught
By genii of the wildwood,
Our laughing faces caught the mirth
From heart of merry childhood,
Our banners bright from joyland came.
The work of fairy fingers,
Weaving with color from the sun
Whose glory in them lingers.

This is the song we poppies sing
All through the bright spring weather;
Out in the sunshime come with us,
We'll dance and play together,
And cover you with gleaming dust
From rarest of all metals,
From out our saucy, laughing hearts,
And from our burnished petals.
—Sarah Pulver McLean.

"FINE KID, THAT!"

WANT any groceries, M'am? I'm from Bumps. I calls for your order and delivers them the same morning. We've got good stuff. Best in town.

I looked up from my task of unpacking dishes into the dark eyes of an undersized, towzle headed boy.

"Why, yes, I do want some groceries. And if you give good service and your prices are right you may consider me a regular customer."

After I had given my order and turned to my unfinished dishes, the boy still stood in the doorway awkwardly pulling at his cap. Finally he blurted out, "Fine kid, that!" and I realized he was taking inventory of my little daughter, as she sat propped up in her buggy by the window.

"We think she's nice," I returned pleasantly. And right then and there, just like any other flattered mother, I decided he was a lad of discrimination and Bumps must be a good groceryman.

"What is your name, boy? We must become acquainted if I am to do business with your firm," I added.

"I reckon you might as well call me Ignuts! Everyone else does, and the name seems to fit."

"Why, what a funny name. Surely you were not christened Ignuts?"

"Christened," he repeated slowly, then laughed as my meaning dawned on him. "Kids like me don't get no water doused on them."

So my acquaintance began with Ignuts, an acquaintance that in the course of its development alternately confirmed and disproved all theories of heredity and environment, until the tragic end opened my blinded eyes.

We had just taken possession of our little summer bungalow, a cheaply built affair of picturesque coziness, but lacking the solidity of a regular domicile. It was early in the season and as yet we were the only ones on the hill to take advantage of the wonderful fresh air and glorious scenery of that delightful summer resort on the mountain side. At present my nearest neighbor (a regular resident of the place) lived some little distance across the gulch, so baby and I were rather isolated and a little lonely at times. But in a few weeks my husband would be with us and the cottages around us would fill up.

Bright and early the following morning, my grocery boy put in his appearance. "Well, Mrs. Elbe, what can I do for you today?" was his greeting on this and every succeeding morning thereafter.

"You may return this bag of onions first thing, Ignuts. It was apples I wanted. You should write your orders more carefully."

"Oh, the order was down all right, Mrs. Elbe. I got the things mixed up with that woman's across the gulch. She jumped on me about it. You know that woman's an awful pill," he continued confidingly, "regular jawer. Don't wonder her old man's full as a goat all the time. Gee! but she was sure givin' that poor gink some goin' over this morning. I stood on the porch and listened. She said you——"

"But, Ignuts," I interrupted, "you should not listen to what is not intended for you to hear and certainly should not repeat it."

"Oh, that's all right, Mrs. Elbe," he responded cheerfully. "You don't just understand. Fine kid, that!" and he ventured, smiling, to the foot of the buggy and baby put out her little hands with an answering smile.

My troubles with Ignuts and his inability to get an order straight almost drove me frantic. Some days he seemed to be in a trance for all the interest he manifested in his work, and his big, dark eyes had a curious far-away expression that looked unnatural and almost menacing. But for the most part he was just an irresponsible, cheery boy.

One morning, after I had been unusually tried with his carelessness, I lost all patience. "Ignuts," I questioned sharply, "why don't you use your brains? You are too stupid for words! You don't know enough to be even a good grocery boy."

"Yes'm," he answered unperturbed, "old Bumps says I have no salesmanship and Mrs. Bumps says I have no sense. I guess I'm no good for nothin'. I don't like the grocery business anyway."

"Well, what would you like?" I asked, crossly.

"Oh, a job as a landscape gardener wouldn't be bad. I could make a swell park. I'm mightly fond of flowers. I never misses a chance to snitch one. You know that rose I give you yesterday? I copped it off old man Mason's bush. Some rose, that. The old guy had been watching it for weeks, but I beat him to it."

"You don't mean to tell me you stole that rose from Mr. Mason's bush?" I gasped. This was going much too far.

"Now, that's all right, Mrs. Elbe. How'd kids like me ever have roses if they didn't swipe 'em? Don't you worry," he continued soothingly, "you just don't understand—that's all."

I felt baffled. Some way all my arguments with Ignuts ended in that way—I did not understand. What did he mean? Well, one thing I understood perfectly. The Masons had called the evening before and there on my center table in all its glory blossomed Mr. Mason's cherished rose. It was a rare variety and he must have recognized it.

I ventured to inquire of my neighbor across the gulch regarding Ignuts' parentage and learned that his father was serving a life sentence for killing his mother in a drunken brawl. My neighbor also volunteered the information that the boy himself was utterly incorrigible, that he should have been sent to the reform school long ago. He fought every boy in town, would not study and his deeds of theft did not end with flowers.

It certainly was hard to reconcile his ingenuous face and manner with all the crimes of which circumstantial evidence had proved him guilty. He had told me his mother was dead and his father had a job with the state. And when I pressed the question as to the nature of the job, he had scratched his head and beamingly answered in a burst of inspiration that it was making roads, fine roads for automobiles, built of rock and sand and things. I could not believe the lad was all bad. His attempt to shield a worthless father showed some filial instinct as well as pride.

One morning he lingered, as usual, recounting a fight in which he had received a bad looking eye. "Well, Ignuts," I said reprovingly, "I hope you did not leave any ugly marks like that on the other boy."

"No," he flashed back, "I didn't! But I'd sure busted his bean for him if my heart hadn't gone dead on me. A fellow like me has just got to fight," he added apologetically. "Of course, you bein' a lady, you don't understand."

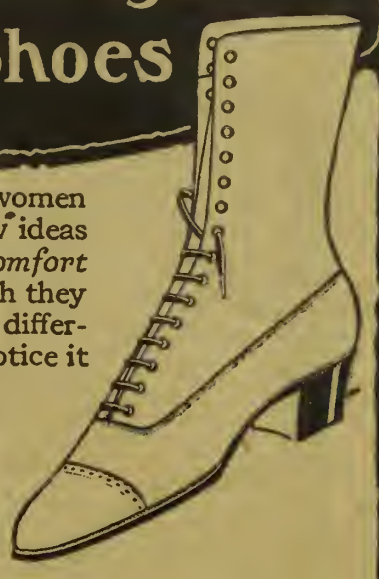
"No, I am beginning to think I don't, Ignuts," I said hopelessly. "You are hard to understand."

"Oh, that's all right, Mrs. Elbe!" and he walked over to baby with his customary "Fine kid, that!" and put down his rumpled hair for her to pull. I noticed his affectionate patting of that particular lock as he replaced his shabby cap—as though he still felt the touch of baby fingers and revelled in the sensation. But I also noticed later that baby's ring was gone. I certainly did not understand!

One evening we were surprised by the unexpected appearance of my husband. The next morning when Ignuts came to take my order I had an unusually long list of complaints. "Now do try and get things straight today,

Easy on Your Feet and Stylish

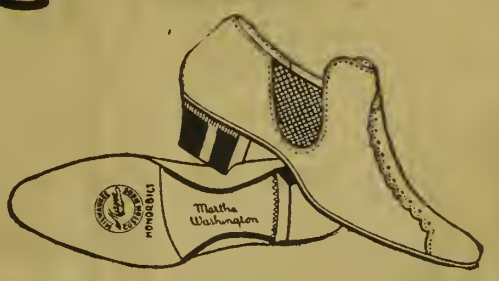
Mayer Martha Washington Shoes



THESE fine shoes for women will give you some new ideas about comfort and style. *Comfort* was the original idea on which they were built—and they feel so different on your feet that you notice it the moment you try them on. It's much more than ordinary shoe comfort.

AND Martha Washington Shoes give you comfort without a sacrifice of style. All the latest styles are included in this line—high and low cut, lace and button. You will notice they have an excellence of detail that gives them the stamp of quality. They wear as well as they look and feel. Martha Washington Shoes are built on honor!

BEWARE of imitations. The genuine have the Martha Washington name and Mayer Trade Mark on the shoe. If your dealer doesn't handle them, write us.



This shoe has been widely imitated. Look for the name and trade-mark on the sole or label in the top.

Never in the world were there doughnuts like Calumet doughnuts. In no others will you find that toothsome, tender goodness. It's the same with all bakings.

CALUMET
Baking Powder

Makes Most Palatable and Sweetest of Foods

Never anything but the very best—light, flaky and wholesome—because this 30-year favorite of leaveners is absolutely pure in the can—pure in the baking. Contains only such ingredients as have been officially approved by United States Food Authorities.

Made in the world's largest, cleanest, most modern Baking Powder Factory.

You save when you buy it—moderate in price. You save when you use it—has more than the ordinary leavening strength—therefore you use less. You save materials it is used with—never fails. Order today. Improve the quality of your bakings. Reduce baking costs.

Calumet Doughnuts

½ Cup sugar, 1 Egg, 3 Level teaspoons shortening, 1 Level teaspoon salt, ¾ Cup milk or water, 2½ Level teaspoons Calumet Baking Powder, 2½ Level cups flour. Lemon and mace flavor.

How to make them—Cream sugar and shortening together, add well beaten egg, then add milk. Next mix in flour and baking powder well sifted together. Work dough as little as possible. Turn out on well floured board and roll out quarter inch thick; cut with doughnut cutter and fry in boiling hot fat.

Valuable 72-Page Cook Book

Handsomely illustrated in colors. Most complete and dependable recipe book ever issued. Hundreds of helps in reducing household expense. Scores of selected recipes. Better ways of making better foods. Send slip found in can of Calumet and three 2-cent stamps to help cover cost of packing and mailing. Calumet Baking Powder Co., 4100-4124 Fillmore Street, Chicago, Ill.

Try Ki-moids for Indigestion

Better service is assured by the advertiser if when writing you mention the California Cultivator.

Ignuts," I cautioned, "for I am to have company tonight for dinner. And be sure and return this bag of cornmeal and bring me sugar instead."

He was in one of his moods of preoccupation and made no reply. My husband, mistaking his silence for rudeness, spoke up angrily. "What's the matter with you, boy! Can't you answer when you are spoken to? Now get out of here and see that you get that order straight this time."

The child started as though he was struck. The unexpectedness of the attack flashed back the curtain of his soul and what I saw in that boy's eyes made me shudder. There it was, the unmistakable heritage of a murderous, drunken father and a dissolute mother. The mother side of me yearned over him and I resolved to see him when he returned to deliver the things and make amends for my husband's harshness. But he left them on the back porch some hours later, without knocking, and I missed my opportunity. When I got ready to make my cake about noon I discovered the sugar was the same sack of corn meal I had returned. It was provoking but I felt I must shield the boy from harsh criticism, so decided to slip across the gulch to my neighbor and borrow some sugar before my husband returned from the village.

I pushed the buggy where lay my sleeping baby into the bedroom, fixed the fire and hurried out. As I scrambled down the steep path and rounded the curve that hid our little bungalow behind a clump of scrub oak, I was thinking over the fate of a most ingratiating little black dog that had taken up his abode with us recently. Despite his cold reception and repeated driving out, he insisted on remaining and making himself perfectly at home. In time his devotion to the baby and the delight with which he hailed his masters' appearance succeeded in winning him a place in our hearts. But he killed the neighbors' chickens, dug up their lawns, fought every dog in the block and was an inveterate thief. Finally, when he buried his sharp little teeth in the leg of a policeman who was poking his nose around our back alley in pursuance of duty, his doom was sealed. In vain I pleaded and protested.

"We cannot allow sympathy to override good judgment," had been the stern decree. So in the interest of humanity and public property poor little Fido was shot and I shed many tears in giving him up to the cause of justice. My husband's unfeeling (or so I felt it) attitude that morning regarding Ignuts and his repeated warning, "Don't allow your sympathy to overrule your judgment," left me both resentful and uneasy. A dog was one thing, but a boy——? Well, time would prove him.

As I picked up my sugar and tore myself away from my loquacious neighbor, I glanced across the gulch. Smoke, in a great cloud, was pouring out of the roof of our bungalow and a thin tongue of flame shot up like a living thing. And my baby was locked up in there asleep! I ran like a mad thing down the hill, stumbling, falling, screaming, across the gulch, and in my anguish and horror it came to me—this was the work of that half crazed, infuriated boy! . . . Could I make it? When I reached the turn in the road I saw only a blazing pile of boards where once our bungalow had stod. My last hope left me. I covered my eyes to shut out the maddening sight and screamed to heaven, "My baby! My baby!"

Then something struck on my ear like the sound of a frightened animal and I realized it was the hoarse voice of a child crying, "Mis' Elbe, I've got the baby! I've got the baby!" And from around the bunch of scrub oak Ignuts came tottering towards me. I clasped my precious to my breast and the boy fell forward on his face. His heart had "gone dead."

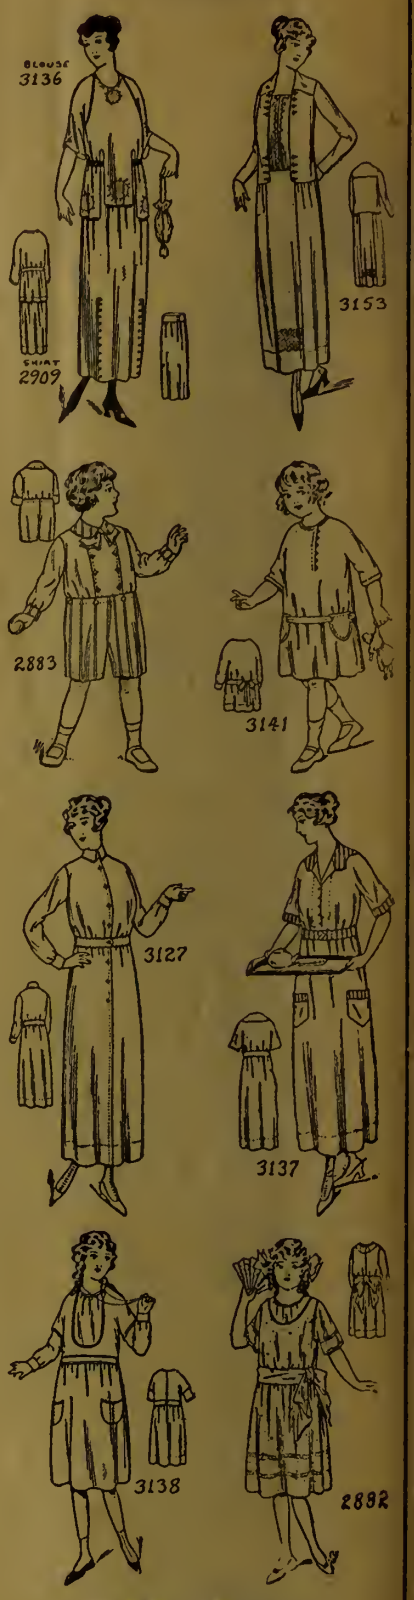
What pangs of remorse I suffered as I saw that little heap of lifeless humanity at my feet. Later, when the doctor had succeeded in coaxing the fluttering spark of life into flame and Ignuts opened his eyes, he gave me a smile of content.

"I knew enough to get the baby, didn't I, Mis' Elbe?" he whispered weakly.

"Oh, Ignuts," I cried, gathering the dirty little form in my arms, "you are the smartest, bravest boy in the whole world!"

"I was bringing the sugar—I was

The Cultivator Patterns



BE SURE TO SEND SIZE

3136-2909. A Smart Afternoon Costume. Blouse 3136 cut in 6 sizes: 34, 36, 38, 40, 42, and 44 inches bust measure. Skirt 2909 cut in 7 sizes: 22, 24, 26, 28, 30, 32, and 34 inches waist measure. For a medium size: 5¾ yards of 32 inch material will be required to make the entire costume. The skirt measures about 1⅝ yards at the foot. Two separate patterns, 10 cents for each pattern.

2883. Boys' Suit. Cut in 5 sizes: 2, 3, 4, 5 and 6 years. Size 4 requires 2⅛ yards of 44 inch material. Price, 10 cents.

3127. A Splendid Work Dress. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 requires 7 yards of 27 inch material. The width of the skirt at lower edge is 2 yards. Price, 10 cents.

3136. Girl's Dress. Cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 will require 1¾ yards of 27 inch material for the guimpe, and 3⅝ yards for the dress. Price, 10 cents.

3153. Ladies' Dress. Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Size 38 will require 6⅛ yards of 44 inch material. The width of skirt at lower edge, with plaits extended, is 2½ yards. Price, 10 cents.

3141. A Simple Dress. Cut in 4sizes: 2, 4, 6 and 8 years, and will require 2¾ yards of 27 inch material for a 4 year size. Price, 10 cents.

3137. A Practical Apron Dress. Cut in 4 sizes: Small, 32-34; Medium, 44-46; Large, 40-42 and Extra Large, 44-46 inches bust measure. For a Medium size 4⅞ yards of 36 inch material will be required. Price, 10 cents.

2862. Girl's Dress. Cut in 5 sizes: 4, 6, 8, 10 and 12 years. Size 8 requires 1¾ yards of 27 inch for the guimpe, and 2⅞ yards for the dress. Price, 10 cents.

awful scared you'd scold and I was goin' to run—then I heard the baby cry. I busted the kitchen window—I couldn't reach the others—it was all afire in there—and—and—oh, it was awful!" he moaned brokenly.

"Well, don't think about it any more, Dear. Just shut your eyes and go to sleep." I saw his lips moving faintly as the drooping eyelids closed, and bending down, heard him say, "Fine kid, that!"

Ignuts has a new name. It was not given him—he earned it. Neither was he "doused with water" at the christening. He won his name in a baptism of fire and the name is Son. He may realize his ambition to be a landscape gardener, for he truly has a wonderful gift of designing and the soul of an artist. And I had thought him half witted because he was not a good grocery boy! I have discovered his real heritage—a sensitive spirit, a loving heart, a quick temper. Just a scrappy, affectionate, easily crushed bit of humanity like all the other boy bits of humanity in our homes. Truly, had I but one prayer to make, it would be thus: "Oh, Lord, teach me to understand."—Farmer's Wife.

NEW WAYS OF USING ORANGES

From the new booklet of recipes issued by the California Fruit Growers Exchange we give some of the newer things:

Griddle Cakes

Two cups flour, 1 tablespoon baking powder, 1 teaspoon salt, 3 tablespoons sugar, 1½ cups milk, 1 egg, 3 tablespoons melted butter, orange marmalade.

Mix and sift dry ingredients; add beaten egg and milk; beat thoroughly and add butter. Drop, by large spoonfuls, on a hot griddle that has been rubbed over with a piece of raw turnip, which will prevent cakes from sticking without the use of butter or grease. When griddle cake is puffed, full of bubbles and cooked on edges, turn and cook on other side. Spread cakes with orange marmalade; roll up like jelly rolls; sprinkle with sugar and serve at once.

Bran Muffins

One-half cup flour, ½ teaspoon salt, 1 cup bran, ¾ cup orange juice, ½ teaspoon soda, 1½ tablespoons molasses, 2 tablespoons melted butter.

Sift flour and salt; add bran, orange juice (in which soda has been dissolved and stirred until it begins to froth), molasses and melted butter. Beat vigorously and pour quickly into hot, buttered gem pans, and bake in a hot oven.

Marmalade French Toast

Two eggs, ½ teaspoon salt, 1 tablespoon sugar, 1 cup milk, 6 slices bread 1/3 inch thick, Sunkist orange marmalade.

Beat eggs; add salt, sugar and milk. Spread bread with Sunkist orange marmalade; put slices together in pairs; soak in egg and milk mixture until softened and cook on a hot, buttered griddle until delicately browned; turn and brown on other side and serve for breakfast or lunch.

Orange Toast

One teaspoon cornstarch, 1 tablespoon cold water, juice 1 orange, ¼ cup orange pulp, few grains salt, sugar, cinnamon.

Mix cornstarch and cold water; add orange juice and boil, stirring constantly for five minutes. Add orange pulp and salt, pour over buttered toast and sprinkle with sugar and cinnamon.

For Breakfast

Remove sections from a large orange and a small grapefruit, free from membrane and arrange alternately around a mound of sugar.

Baked Orange for a Cold

Cut a slice not quite through for a lid, across the top of an orange. With a sharp French knife remove the core, put in a teaspoon each of orange syrup and lime juice; bake until heated through; place a cream peppermint candy in the center and serve.

Graham Muffins

One-half cup flour, ½ teaspoon salt, 2 tablespoons sugar, ¾ cup graham flour, grated rind ½ orange, ⅞ cup orange juice, ½ teaspoon soda, 2 tablespoons shortening.

Sift flour, salt and pepper; add graham flour, grated rind of Sunkist orange, Sunkist orange juice (in which soda is dissolved and stirred until it begins to get frothy), and melted shortening. Beat well and pour quickly into hot, buttered muffin pans and bake.

HOUSEHOLD QUERIES

Mutton Tallow for Shortening

What should I mix with mutton tallow to make a good cooking compound?—Subscriber, Kingsburg.

We presume our subscriber wants to prepare mutton tallow for shortening in large amounts to keep for some time. Have any of the Cultivator housekeepers had experience that they will pass on to the rest of us?

To Clean Brick Fireplace

I have just learned how to restore the natural surface to a brick fireplace which was scored and marred by workmen in laying. The rough and mortar flecked spots were rubbed off carefully with another bit of brick. Then a cloth dipped in a half and half mixture of distillate and linseed oil was rubbed over the surface. This apparently removed all scratches, smudges and stains and left the brick surface in perfect condition.—J. J.

BOY SCOUTS WILL MEET IN NEW YORK

The annual meeting of the national council of the Boy Scouts of America will be held in Hotel Pennsylvania, New York City, on March 25 and 26.

This will be followed by a monster Boy Scout rally to be held March 27. At this rally from five to ten thousand boys will give a scout demonstration.

Major General Leonard Wood has definitely agreed to be one of the speakers and other strong men will contribute to the solution of the present day problems of America through the proper education of its boyhood and young men.

Each local Boy Scout council is entitled to one national council member and an additional member for each thousand boys under its jurisdiction.

It is expected that at the tenth annual meeting the half million scouts and their leaders will be as fully represented as possible. There are about 475 members. The last annual meeting was attended by 116 members of the national council.

THIS WEEK'S PATTERNS

A good pattern for a separate blouse of georgette or voile is pictured in 3136. Plain colors are most used, matching or contrasting with suit or separate skirt. A bag such as shown here, to match hat is a feature of the dainty spring costumes. Simple bags like this one and exceddingly elaborate ones, padded on one side like a muff or a chair cushion are seen in many windows. They are made of taffeta or other silk of same material as the hat and are trimmed with same ribbon-made flowers, etc. Some are so elaborate as to be rather absurd, but it is a charming idea and in the hands of the woman of good taste leads to most attractive results.

The dainty child's dress 3140 shows the charm of the quaint and simple style. The loop buttonholes and quick stitching used to outline neck, sleeves and pockets may be of black or of a pretty contrasting shade.—R. P. D.

TO REMOVE STAINS

I have been reading with interest your recipes and suggestions in your household department contributed by subscribers. I respectfully submit the following that may be of value to someone:

Saturate grass stains thoroughly with kerosene, then wash as usual.

Rub sewing machine oil stains with lard; let stand for several days, then wash with cold water and soap.

Soak ink stains in sour milk.

Wash iodine stains with alcohol, then rinse in soapy water.

Soak iron rust stains thoroughly with lemon juice; sprinkle with salt and bleach for several hours in the sun.

Glycerine will remove peach stains if applied two or three times.—A Subscriber, Fallbrook.

When Buying a Piano Get Satisfaction Not a "Bargain"

Some people are induced by misleading advertisements and shady selling methods to buy a Piano at a "special" price, thinking they are getting a bargain. In the end they find they really paid a high price because the instrument was so inferior that it gave out completely in a few months requiring the purchase of a new good Piano.

It takes good materials, honest workmanship and expert knowledge to make good Pianos—and these cost money. You can't get something for nothing—Pianos are no exception to this universal rule.

But how are you to judge the quality of a Piano? Very few people know about scale design, plate construction, actions, felts, veneers and varnish work. After all, does not your permanent satisfaction lie in the selection of a reliable Piano House—one who is known to carry good dependable makes, who stands back of them, whose prices are fair and represent full value for the money expended?

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

The Wonderful Attractions of BRITISH COLUMBIA

Few countries possess all the conditions for happy, prosperous living as does British Columbia. The varieties of climate and soil offer inducements for almost every branch of agriculture. Whether in the warm interior valleys, the rich grazing table lands or the fruitful lowlands of the Coast or Vancouver Island, the advantages offered for

Dairying, Fruit Growing and Stock Raising

are such as must appeal to those who wish to improve their circumstances and at the same time live in a country of delightful climate, magnificent scenery, varied resources, progressive people and abundance of opportunity for development. British Columbia—the playground of America—is already famous for the production of its orchards, fields and dairies. Now, is the time to **Learn about this wonderful Province** and share in its possibilities. It's industrial life—mining, lumbering, fishing, manufacturing, transportation—assures a ready market at good prices for all the farmer can produce. Schools, churches, railways, roads, telephones, all the conveniences of an old land await you in this new Province of Opportunity and Success. For illustrated literature, maps, etc., write Department of Immigration, Ottawa, Can., or

If baby chicks could tell you what they want—

They wouldn't hesitate to speak right out in meetin'. They would demand, first of all, *clean* feed. For, nothing is good enough for a baby chick that is not clean enough for a human baby. Then—they would ask for a feed that is uniform, properly granulated and proportioned for their delicate digestive organs. They would show you why they require a balanced ration—just as your grown hens do.

To make a long speech short—they would ask for Sperry Baby Chick Feed. For this balanced ration supplies all the food values that Nature intended a growing chick to have. It is made from prime, clean grains—*kept clean* throughout its entire process of manufacture.

After all, the amount of feed eaten by a baby chick during the baby chick period is so small that the slight difference in cost between poor feed and Sperry Baby Chick Feed means nothing—especially when you realize that the saving of a very few chicks more than makes up for it.

Remember, too, that Sperry Baby Chick Feed is *absolutely gritless*. There's a worthwhile saving there—because all you need do is to add about 5 per cent fine shell and grit when using.

Our booklet, "Makes Hens Happy" devotes quite a bit of space to this all-important question of feeding baby chicks. We'll gladly send a copy on request. Simply cut out the coupon and mail today—it's free!

Impossible by Arithmetic---Possible by Common Sense

By C. B. Messenger

IF the feed for producing a dollar's worth of eggs costs $1.05, how long will it take a poultryman to acquire great wealth?

This problem has caused many a poultryman to tickle his ear with his pencil and dig up all the old 'rithmetic rules he learned in school to figure it out. And some of the old catch problems of school days, often not solved until after school, were no harder than this problem of mature years, but the poultryman has had to stay in at recess and after school to do it—and he is now performing a miracle.

It has been simply a case of cooperation, not cooperation in cornering or holding up the market, but cooperation in buying more efficient and well balanced feeds, cooperation in culling or cutting out the boarders, cooperation in delivering to the market more economically and regularly, cooperation in shipping to the best markets in the United States—more than all, cooperation in standardization.

When a little white hen consumes 70 or 75 pounds of feed in 12 months she has got to be kept pretty busy to pay her board, and standardization alone has enabled cooperating producers and marketers to command from four to eight cents above general market for their product. This increased price has saved the day.

At the same time it has required service that has cost a large part of the increase. But the American consumer demands a first class product, and once the brands have been established by the associated poultrymen they will increase in value and secure still greater return. The long headed business managers of the poultrymen have learned that certain markets have certain requirements, and without trying to force their own ideas on those particular markets they are meeting the conditions and standardizing according to their requirements.

Recently an entire trainload of California eggs was sent to New York markets. Every egg on the train was a white egg and if branded "Extra" came up to the 20- to 26-ounce standard. And not withstanding the fact that some of the eggs were brought into the packing house fresh from the ranch on the day of shipment every egg in every car was candled by an expert. The dealer in New York has learned that these California brands cover eggs which are absolutely dependable. That reputation is what is securing four, five, six or more cents per dozen over the market for the day.

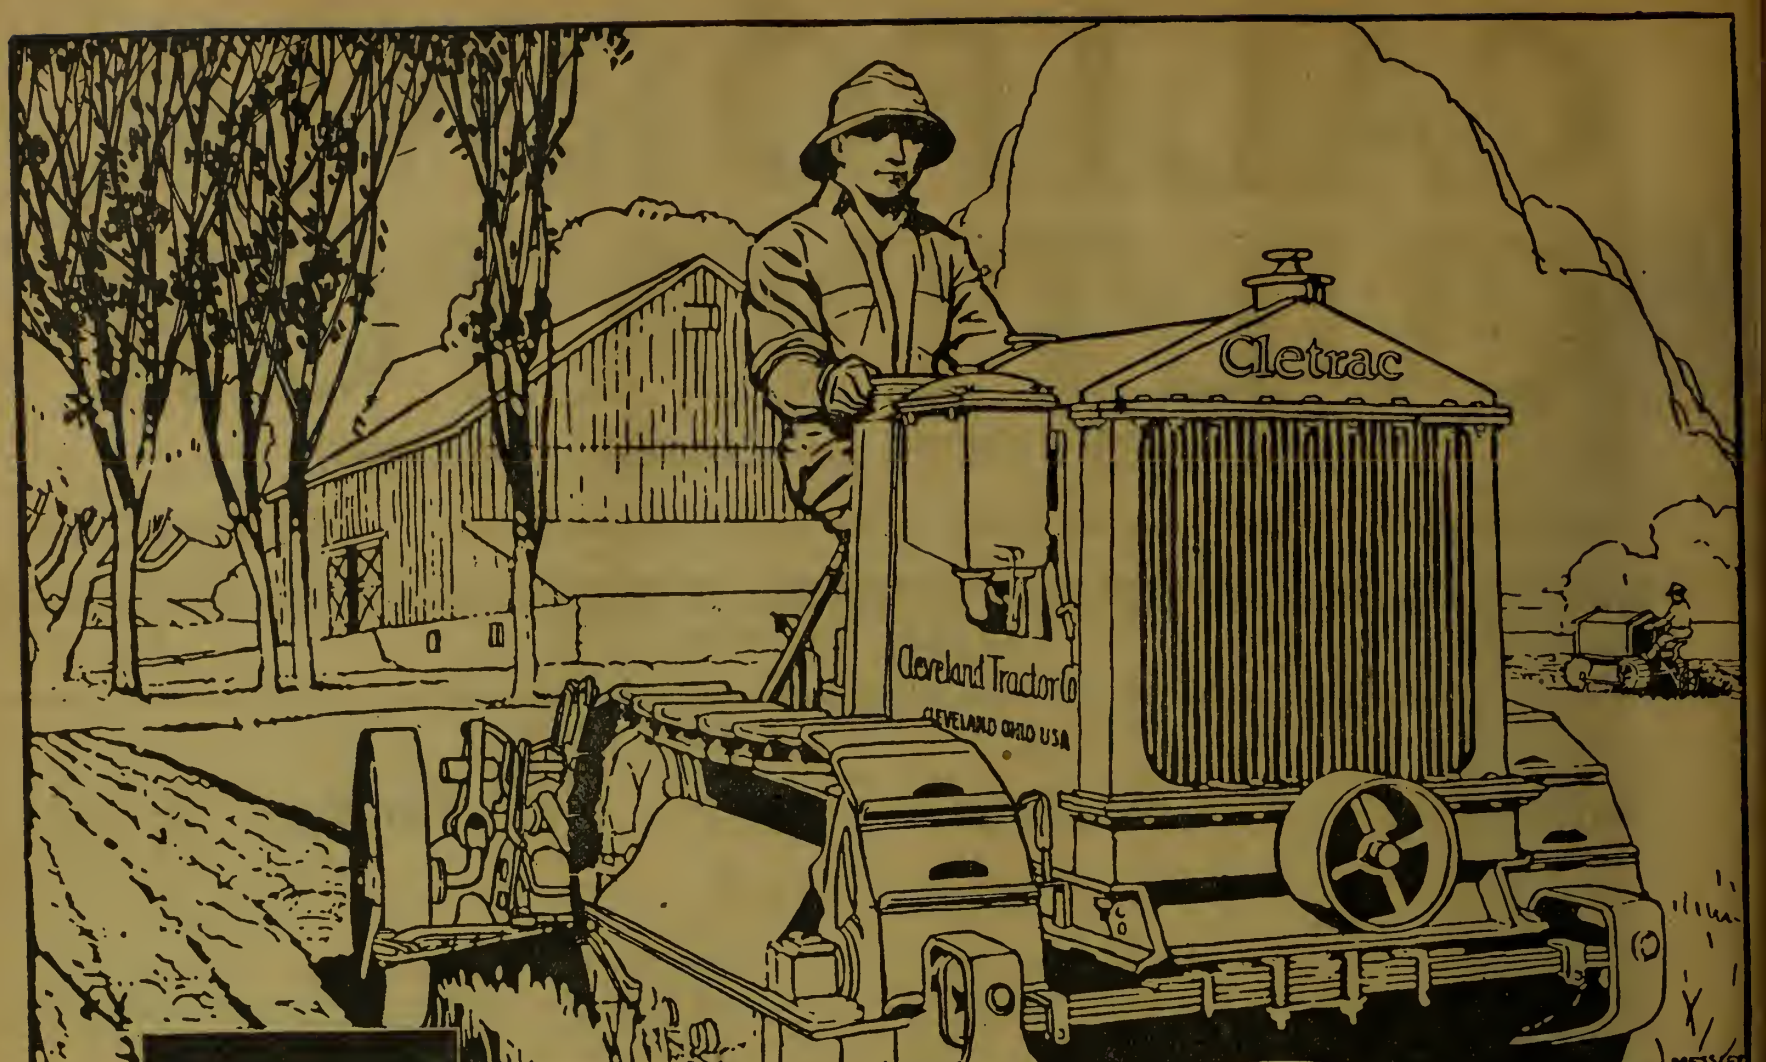
Notwithstanding this reputation the management is still not content to allow its product to stand simply on reputation, but has adopted the slogan: "The standard cannot be too high; next year's eggs and every year's thereafter will be of still higher grade." With this association's method of handling there is no such thing as "case counts." Every egg that goes out is candled and guaranteed.

While New York and many markets prefer the white egg there are others which have strong preference for the tinted or the brown egg, and these requirements are catered to, and hence proper distribution is a big factor in these satisfactory prices.

These trainloads which go from Northern California, together with some six or eight cars, 400 cases to the car, weekly from Los Angeles to Eastern markets, is one reason for the local market being stabilized as well as it has been during the past few months.

Every producer has had the advantage of the work and achievement of these cooperators, and yet not one-third of the production of the state is represented in the cooperative associations. This is an injustice to those who are bearing the expense of stabilizing the market and it should be ended by a greater number of the producers getting into line.

There are two great associations in California; The Poultry Producers of Southern California, Inc., and the Poultry Producers of Central California, Inc. There are 525 producers now members of the Southern California association; the Central California association is still larger. The—(Continued on Page 457.)



Easy Going on a Track the Cletrac Way

Cletrac
TANK-TYPE TRACTOR

Speed Up Spring Plowing

Speed up your Spring plowing with a Cletrac. It makes no difference how soft or slippery your soil is, the Cletrac will be *there* with power galore. It lays its own endless track and travels over it with a light but sure-footed tread. It doesn't sink in or pack the soil. The Cletrac turns short, too, swings back to the furrow quickly without loss of *time or power* at the turn. It puts more acres under cultivation and helps produce bigger crops.

And the Cletrac not only plows—it is just as helpful for preparing the seed bed, discing, harrowing, fertilizing and harvesting. It does *all* your haulage and belt work. Runs perfectly and economically on "gas," distillate or kerosene. Costs less to operate than the six to eight horses it replaces—works more hours a day and more days a year too.

The Cletrac has made good. Farmers everywhere have "O-K'd" it. This popularity has led to a bigger output and lower manufacturing costs. As a result, we are able to offer you an *improved Cletrac with a larger motor, an 8-inch-wide single grouter track, an exclusive steering device and a special water clarifier, and reduce the price from $1585 to $1395 F. O. B. Cleveland.*

California Cultivator

Vol. LIV, No. 11. Los Angeles, March 13, 1920 One Dollar Yearly

The Boom in Walnuts

By A. F. Clarke

THERE is something very like a real walnut boom on in California, or, more accurately speaking, there would be if trees were available. As a matter of fact walnut trees are so scarce that a few nights ago 254 trees which had been planted less than a week before were pulled up and toted off by a distinctly new class of larcenist. This was out at Perris, where alfalfa seems likely to divide its kingdom with fruit and nut trees—if the trees aren't stolen.

I had a most interesting chat the other day with Dennard C. Wylie of the field department of the California Walnut Growers Association. Mr. Wylie, who is one of the best posted walnut men in the state, puts in his time with the walnut growers south of the Tehachapi, advising them as to cultural methods, grafting, pruning, irrigation, fertilization and the like. He says he learns a lot more from the growers than they learn from him; but maybe that's because he's young and modest.

"Walnut planting this season seems to be a question of available nursery stock," said Mr. Wylie. "It is estimated that the planting in Southern California alone will exceed 5,000 acres, and the northern planting will add quite materially to this figure. Budded walnut trees have established a new top price in California, due to the tree shortage and the unprecedented demand. As high as $3.50 a tree has been paid for walnut trees the past month that would ordinarily sell from 50 cents to $1.50 each, and many are unable to get trees.

"The reason for this tree shortage as I see it is due to the exceptional prices that have ruled the past two years and which seem likely to prevail for a number of years more. Ten years ago soft shells No. 1 sold for 11½ cents a pound. The price fixed this year for No. 1 soft shells by the California association was 31½ cents a pound, and the production in the state was 50,000,000 pounds last year as compared with 18,700,000 pounds in 1909. Due to the war the importation of walnuts the past two years has dropped materially from normal figures. No figures are available on 1919 importations, but the 1918 importations were 21,248,000 pounds as compared with 40,416,000 pounds in 1917. The total consumption in the United States in 1918 was 62,722,928 pounds. This is a drop of nearly 8,000,000 pounds from 1917, due to the lessened importations.

"The general uncertainty caused by war conditions and the fact that many young men who might have aided in planting and grafting walnuts were fighting in France handicapped production of nursery stock. It will be three years before production catches up with demand.

"The northern black walnut stock (Juglans hindsii) is absolutely the best stock for grafting. It produces a sturdier tree than the southern black and stands variations of heat and moisture better. It is now recognized that a good root is the first essential of a walnut tree.

"Owing to the great demand for walnut trees this season there has been a considerable sale of seedlings. Practically all the well known varieties in Southern California are variations of the Santa Barbara soft shell. Some produce a fine grade of nuts and the trees are vigorous growers. In other trees the nuts are small and have no meats or inferior meats.

New Variety Promising

"For years experiments have been carried on to find a variety of walnuts that would be immune to blight, and several new varieties of the Santa Barbara soft shell type have been widely heralded as blight resistant. Of these new varieties the Ehrhardt seems worthy of propagation, though a longer series of tests would be necessary to determine its ultimate value. The Ehrhardt is similar in size and general characteristics to the Placentia Perfection, which has come to be regarded as the standard soft shell of Southern California. Plantings made alongside the Placentia Perfection show much less blight than on the latter."

Asked if he would plant the new variety to the exclusion of the favorite Placentia Perfection, Mr. Wylie replied:

"I believe that I would interplant

(Continued on Page 430.)

Citrus Planting for 1920-21

By Ernest Braunton

RECENT investigation among the heavier growers and shippers of citrus trees shows that the present season's supply is far short of the demand in all leading varieties. Aside from our own planting and needs Texas called for at least 50,000 pomelos more than were shipped to that state from California.

Reviewing the present season's orders and those booked for 1921 delivery it is evident that Navels are strongest in demand with Valencias a close second and lemons a good third. Aside from these the demands for others (in California) are light and in order of importance are: Pomelo, Dancy tangerine, Ruby Blood, St. Michael, with a few of many others. Shipments to outside points are not large with the exception of pomelos to Texas, one firm now shipping to that state 20,000 pomelo trees and 1,000 of all other varieties combined. A few citrous trees are each year sent to South Africa, South America, Italy, China, Japan, Java, India and other remote sections of the world.

Growing the Tree

The best growers now use selected seeds only. They are run through a screen that allows all small sizes to drop through, and these are discarded as being of inferior vitality and will not therefore produce a vigorous plant. Twice as many seeds are planted as the number of plants needed. About ten per cent or less do not grow and about 40 per cent of the seedlings are discarded as not up to the high standard set by our leading nurserymen. This eliminates inferior stock and "seconds." The seedlings are grown for two years before budding so they may size up and be cleaned up to a point where they may be budded high.

The demand at present is for trees budded from six to ten inches above the ground. This protects them against gum disease and rooting above the bud. It has often occurred that low budded trees deeply planted have rooted above the bud and nearly brought ruin to the orchardist. After the bud has grown the stock top is cut away and the little "adopted child" or bud growth carefully tied to a stake tall enough to train it to the proper height, and all these buds are taken from certified trees or those selected because of their heavy yield of high grade fruit.

As the little tree grows it is further tied to the stake to secure a straight, trained stem, and this is cut off at a height of 33 inches. This gives nine inches for the distribution of the leaders and a clear trunk below of 24 inches. These leaders should be well distributed in this nine inch zone, both up and down as well as around this portion of the stem. If all leaders spread from the same point like the rib braces of an umbrella it is a very poor tree and new leaders should be encouraged and one-half the first lot cut away.

Choosing the Tree

When the trees are dug the balls of soil should bear a proper relation to the size of the tree. Standard weights and sizes deemed best are: 35 pound ball for trees one-half to five-eighths of an inch stem caliper or diameter; 40 pounds from that size up to three-fourths and 50 to 60 pounds for those on up to one inch diameter. Large trees for resets in young orchards, two or three years old, should have balls of from 100 to 150 pounds weight. The writer has seen four year old orange trees removed from the nursery row with 200 pounds of soil each and not one died and at the end of several years these were as large and vigorous as those originally planted as yearlings.

When buying trees do not scruple to pay freight, if necessary, on balls of proper size. A considerable part of the root system must go with the tree or loss by death or poor trees will result. If distance makes such shipments practically prohibitory it is better to ship with bare roots carefully packed in sphagnum moss. Buy by caliper below rather than above the bud. If the tree has not a good basic trunk and root system it will never give satisfaction; yet a poor bud will never make a good tree, no matter what support is given it, so choose your trees with care. A spring bud but two feet high on a good root is rather to be chosen than a much larger tree on a less vigorous foundation trunk and root system. To be short, do not reject a tree because of small caliper; carefully note what it is growing from.

Do not buy trees direct from the field if you can avoid it. The best dealers "cure" their trees. They are placed in lath houses for a week to ten days to recover from shock of cut roots and changed conditions. At the end of that time those with cracked balls, insufficient or injured roots will manifest their injuries and be removed from the lot. This insures a 100 per cent orchard growth.

All good nurserymen, as before stated, bud from wood taken only from trees of known and approved fruit production and each tree's offspring is kept by itself. If you buy a hundred trees these may all come from one parent tree. In case of a thousand or more they may have been from several selected trees. The dealer will ship them marked so the orchard may be planted in blocks of one common source and will give you the registered numbers of the parents. In years to come you will be able to note if any difference is apparent in the crop and trace its source.

Interesting Records

The proportion of bare root trees to balled trees shipped by one dealer was checked and it was found that those sent into Ventura County, for example, was the proportion that would hold good, approximately, for all shipments. The record was 250 bare root trees to 30,000 balled trees. As to age of trees, at least 50 per cent were yearlings, 40-45 per cent two year olds and the remaining five to ten per cent were three year olds for resetting in young orchards where previous year's plantings had died.

Talking with experienced orchardists and nurserymen brings to light the unanimous opinion that we still are planting too close. The range should be from 24 by 24 to 30 by 30 feet, according to variety, but never less, and on the square method only. Navels and lemons should be 24 by 24 and Valencias 30 by 30 feet. In all hard or stiff soils holes should be "shot" or dynamited, and some advocate this treatment in all soils. In clays or soils that will run together again sand or light soil in small amounts should be thrown in the holes to be washed down into the cracks to keep these from cementing shut by a puddling process which will surely take place.

Agricultural News Notes of the Pacific Coast

Northern California

A new $250,000 cannery is soon to be built at Sacramento.

The rice mill at Colusa sent out 27 carloads of rice last week.

Indications are for a big almond crop in the Sacramento Valley.

The last livery stable in Willows, Glenn County, closed its doors on March 1.

James Mills of Hamilton City has been elected president of the Western Berkshire Congress.

Some damage is reported to blossoms in unsmudged almond orchards in Sacramento Valley.

The California Pear Growers Association is making plans to establish a number of drying plants to take care of windfall fruit.

The second week of August has been decided on as the time for holding the Eden Township Farm Products Show in Alameda County.

Farmers interested in the formation of the Williams irrigation district in Colusa County are going ahead with their organization plans.

An Alameda County sheep man has just made sale of 2,400 ewes to a rancher at Flagstaff, Arizona. The price reported was $20 a head.

Livermore, Alameda County, reports Japanese winery men trying to make arrangements to ship discarded winery plants from this state to Japan.

The California Farm Bureau Federation at its recent meeting in Berkeley resolved to give its moral support to the Milk Producers Association.

The supervisors of Sacramento County are planning the construction of a bridge across the Sacramento River a half mile below Courtland.

The Sutter County farm bureau has arranged for a series of community auction sales this month where stock, implements and any other article may be offered.

California olive packers met at San Francisco March 4 with representatives of the state board of health to consider the poisoning cases reported from the East.

The El Dorado County chamber of commerce sent a delegation to the irrigation and water conference called by the Sacramento Valley Development Association.

Tbe farm bureau of El Dorado is today, March 13, holding its annual market day sale and auction. Livestock, household goods, farmlng equipment of all kinds will be disposed of.

Tbousands of tons of rice straw, formerly allowed to go to waste, will be baled by the Western Rice Straw Growers, Inc. There is a rapidly growing demand for rice straw, principally by packing corporations.

Representatives of water users, chambers of commerce, the railroad commission and the water commission met last week in San Francisco to determine plans for irrigation and water power control for the coming dry season.

Several poultry farms in Alameda County are belng handled under the supervision of R. B. Easson, poultry extension specialist of the University of California. These farms bclong to Ralph Melnbcrger, Castro Valley; F. Eckland, Castro Valley; S. McCabe, Castro Vallcy; Gus Jobnson, Orcbard Avenue; M. Bargman, Livermore.

Central California

Fresno is beginning preparation for celebration of 1920 Raisin Day.

A federal grain grader has been installed at Stockton. Ben R. McGee is in charge.

Work is soon to begin on the new plant of the California Prune and Apricot Growers at Visalia.

Fig growers of Fresno met recently to consider putting thehir product under state standardization.

A fruit drying plant is being erected on the property of the American Fruit Growers at Lodi, San Joaquin County.

Robert H. Frazier of Modesto will take charge of the 1920 state wool pool of the California Farm Bureau Federation.

The California Associated Raisin Company has filed brief in the federal investigation at Washington on the price of raisins.

Evaporation or dehydration plants will be built at Dinuba, Kingsburg, Clovis, Watsonville, Lodi and other Central California points.

San Joaquin cotton experiments have been so successful that it is anticipated the coming season's plantings will be much heavier.

A consignment of 2,000 baby chicks was received last week by the Tulare Cooperative Poultry Association for distribution among members.

The newly completed plant of the California Central Creamery at Los Banos, Merced County, will put out 9,000,000 pounds of dry milk annually.

The drouth is even affecting the salmon catch. Monterey fishermen say that the decreased flow of fresh water into the bay is keeping away the salmon.

Stanislaus County Holstein owners have formed an association with A. M. Bibens, president; H. E. Cornwell, vice-president; E. M. Morrow, secretary-treasurer.

The minimum price on Pima cotton has been set by one company at 60 cents a pound, with the company making a half promise that price may go to 80 cents or $1.

Tulare County water users recently met at Exeter and planned for greatly increased membership in the irrigation association. The work is being assisted by the farm bureau.

Contracts have been let for the planting of 1,300 acre vineyard near Porterville, Tulare County. There will be 33 complete pumping plants installed to supply the water.

Experiments with 55 different varieties of wheat, barley, rye and oats are being conducted by the University of California experiment station on the C. W. Gates ranch in the old Tulare Lake bottom.

A deputy horticultural commissioner of Tulare County reports 931 tests of oranges during the past shipping season. The tests began November 3 and were made as long as there was any question as to ripeness and sugar content of the fruit.

The temporary organization of the Turlock branch of tbe Oriental Exclusion League has been made permanent. Officers have been electcd: President, Arthur G. Crowell; first vicc-prcsident, Frank McVey; second vice-president, Nellie H. Niland; thlrd vice-president, Paul Carlson; sccretary, L. C. Martyn; treasurer, D. J. Walton.

Southern California

A cooperative cannery is being erected at Riverside.

Rlverside has shipped out 1,000 carloads of citrus fruit the present season.

Dates have been fixed for the Southern California Fair at Riverside, October 13-19.

The Riverside County Beekeepers Association has decided to affiliate with the county farm bureau.

The California Lima Bean Growers Association reports many orders received since prices were lowered.

Hemet, Riverside County, papers announce establishment of a big turkey farm to be stocked with 4,000 birds.

The California Cattlemen's Association will launch a membership drive in Imperial Valley and San Diego County.

Experimental plantings of cotton and flax will be made at the state hospital at Patton, San Bernardino County.

It is announced that the United States health service has purchased the Arrowhead Springs property, San Bernardino County.

R. B. Nebelung has been appointed farm adviser of Riverside County to fill the place left vacant by resignation of R. N. Wilson.

Over 30,000 trees have been planted on burned areas of the San Dlmas watershed, Los Angeles County, and plantlng will continue.

At the recent annual meeting of the Riverside Beekeepers Association R. Powell was elected president; C. Kendie, vice-president; Lester Bamberger, secretary-treasurer.

Riverside County growers will have an opportunity to listen to lectures from a cotton expert of the U. S. bureau of plant industry, now stationed at Fresno.

A convention will be held at Los Angeles, April 1-3, of the League of the Southwest. The principal subject of discussion will be the improvement of the Colorado River basin.

The strike of Mexican orange and lemon pickers at Corona is over. A pumber of white men were secured to take the pickers' places and another lot of Mexicans brought in from El Paso.

The second annual exhibit of the Imperial Valley Poultry Association was held at El Centro the first week in March. Birds were exhibited from all over the valley and many from Los Angeles.

The semi-annual convention of the California Cattlemen's Association will be held in Los Angeles, April 15-16. Senator Kendrick, president of the American National Livestock Association, will be one of the speakers.

A meeting was held recently in El Centro, Imperial County, of representatives of the farm bureaus of the six southern counties of the state. Exclusion of Asiatics and farm bureau marketing were the prlncipal toplcs discussed.

The project has been started to divert water from the San Gabriel Canyon through a branch of tho Little Dalton to Puddlngstonc Falls. A big dam will bo constructed. Water consumcrs in the district supplied by the San Gabrlel watershed are protesting.

The Coast and General

Many sales of citrus land near Yuma, Arizona, are reported.

Heavy lumber shipments are being made from the Columbia River.

A new strawberry cannery is promised for Mt. Vernon, Washington.

Arizona is plowing and preparing seed bed for its biggest cotton crop.

Chandler, Arizona, claims 30,000 head of fine lettuce in its backyard gardens.

American buyers are reported to be making heavy contracts for Argentine hides.

The Cascade national forest, Oregon, has granted permission to graze 17,722 head of stock.

The dairymen's association of Skagit, Washington, is erecting a $400,000 milk handling plant.

The Tillamook County, Oregon, Cheese Makers Association recently held its annual meeting at Tillamook.

Now comes a serum for combating "olive poison." This is the same serum used for treating forage poisoning of horses.

Farmers of Bogle, Oregon, recently beld a progressive clearing bee on several farms. The idea will be further carried out.

The farm bureaus of Island, San Juan and Snohomish Counties, Washington, are combining in purchase of stumping powder.

An irrigation dlstrict has been formed at Yakima, Washington. It will include 40,000 acres in the Wenas, Selah and Moxee Valleys.

The Wasco County, Oregon, Poultry Association will conduct six poultry schools of two days duration at various centers in the county.

The California Automobile Association sends out warning to employers that it is illegal to permit boys under 18 to drive trucks or delivery wagons.

The Mutual Creamery Company of Eugene, Oregon, will erect a new $100,000 plant for condensing milk, making cheese and butter and other products.

A fund of $100,000 is to be spent in changing a brewery at Vancouver into a cold storage plant. It will have a capacity of 300 carloads with 30 ton ice plant capacity.

The marketing department of the Jackson County, Oregon, farm bureau shipped out 60 carloads of livestock last year and made large purchases of fertilizers for orchardist members.

The Utah-Idaho Sugar Company is planning to operate all three of its factories in the Yakima Valley of Washington this season. The company is putting in large acreage on the Yaklma Indian reservation.

Attorney General Fowler of Nevada has rendered decision that the law passed by the state legislature in 1919 provlding for organization of farm bureaus under state and county cooperation, is unconstitutional. The matter will immediately be taken to tbc supreme court.

The Utah-Idaho Sugar Company, which operates tbree factorles in the Yakima Valley of Washington, has announced a flat price of $12 per ton for sugar beets this season. Yakima growers have contended that they cannot raise beets at a profit for loss than $15 per ton, and tho company will undertake a campaign to sign up new acreage for that which is withdrawn

Water Supply Studies in Southern California

By W. A. Johnstone, State Water Commissioner

ELEVEN modern stream gauging stations have just been completed on the mountain streams feeding the Santa Ana River. This marks a long step in the progress of a scientific and thorough study of the water resources of the state and is being carried on through a cooperative agreement between the state water commission, the counties of San Bernardino, Riverside and Orange and the United States geologic survey, United States forest service, and the United States weather bureau, and is an extension of the study being maintained on the mountain watershed of Los Angeles County where 15 stations of the same kind have been placed, covering all the principal mountain streams from Pacoima Canyon near San Fernando to the San Antonio Canyon on the east line of the county. The purpose of the study is to obtain dependable records of the rainfall on the mountain watershed and of the water discharged by the mountain streams on the plains and at salient points in the course of the larger streams or rivers. The collection of this data requires that it shall be gathered by expert engineers and observers so that when collected it will be regarded as dependable in every way, and to be so the records must be continuous and unbroken and extend over as long a period of years as possible. Most of the records now available are fragmentary and incomplete. Under this study, maintained through the foresight of the supervisors of the three counties and the active cooperation of state and federal officers, there will be collected data that will be of the greatest value in the future development of Southern California. Water is the very essence of life with us and the supply available must be conserved in every possible way and put to the fullest use if we are to extend the growth of this section to its greatest possibilities. Irrigation, power, storage, spreading and flood control projects must be based upon such data and the longer the records are spread in time the more valuable they become. They must also cover all of the variations of seasons and cycles so that wet and dry periods may be anticipated and provision made to meet such conditions when anticipated.

We have arrived at the time when we must turn to mountain storage where possible and practicable and to underground storage in other situations. The underground supply of water held in the gravels of underlying basins has become an extremely important part of our water resources, and the increasing draft upon these reserves makes it yearly more apparent that we must do all that is possible to get the flood waters into the upper detrital cones which exist at the outlets of the mountain streams and not let them rush off in flood times to the ocean, destroying valuable property in their progress. Such percolating waters travel underground very slowly and become an available supply for the rapidly increasing number of pumping plants now in operation during the summer months.

All spreading and other storage systems must be designed to meet the stress of maximum flood conditions, and hydraulic engineers are entirely dependent upon rainfall and runoff data in making their plans and estimates. The same thing applies to flood control, highway and bridge construction as well as the protection of our coastal harbors from silt infiltration.

It is proposed to extend these studies to include a thorough ground water survey, and when this is done the records obtained will be unusually complete.

The study now under way on the Santa Ana is modelled after one that has been in effect in Los Angeles County for the past three years, and much credit is due to the Los Angeles County board in joining in the initiation of a method that combines into one effort all the federal, state and county machinery usually employed in such work so that all useless duplication of effort is avoided and funds are made available to carry on the work in the most scientific and permanent way.

The stream gauging stations are built of solid reenforced concrete and are expected to withstand any floods or storms that may ever occur. They are equipped with the latest type of self recording instruments and will give an accurate gauging height record of the flow of the stream by hours, days and months.

The rainfall gauges are of two types, the common United States standard gauge used and furnished by the weather bureau and the new Marvin self recording gauge which records the intensity of the rainfall as well as the quantity and tells when the rain fell and how rapid the precipitation. Six of these instruments are now installed between Wilson's Peak and Mount San Bernardino. Eighty-nine official gauging stations have been installed, mostly on the mountain watersheds, by the weather bureau under the direction of Dr. Ford A. Carpenter, until recently meterologist in charge of the Los Angeles office. These are inspected each year and daily records maintained, and it is confidently expected that from the use of these instruments a far better understanding of the rainfall on the mountain watershed and the laws which control it will be learned than we have at present.

The greatest credit is due Captain F. H. Fowler, district engineer of the forest service; H. D. McGlashen, district engineer of the United States geological survey and his assistant, F. C. Ebert, engineer for Southern California, Dr. Carpenter and the supervisors of the four counties for the excellent work done by them in making such cooperation possible and practicable.

The Richness of California's Valleys is Made Possible by the Waters of the Hillsides

Control of Mealybugs and Other Pests

By Harry S. Smith, Office of Pest Control, California, Department of Agriculture

THE citrus grower has had one continuous fight since the days of the Mission Fathers, or at least since the days when citrus culture became a commercial factor with the orchards planted near the Old Missions. The first serious jolt given to the industry was in the early eighties when the white scale almost eradicated thousands of acres of citrus orchards. The natural enemy of that pest was found and the industry saved. Other natural friends of the grower and enemies of these pests have since been found and will continue to be found. At present the growers are observing with much interest the work of natural enemies to the citrus mealybug, a pest almost as serious as was the white scale, and far more serious than is the white scale problem of today. Accounts and many illustrations of this pest and the work of its natural enemy, the cryptolaemus, have appeared in the columns of former Cultivators. We are glad to add to the information regarding the mealybug fight by making quotations from Harry S. Smith's address before the recent citrus institute.—Edit.

* * *

The problem of mealybug control has long held a prominent place in the minds of the citrus growers of California and has been the subject of a great deal of experimental work by federal, state and county entomologists, as well as the growers themselves. The citrus feeding mealybugs, of which there are several species, have been found extremely difficult to control by means ordinarily successful against other citrus pests, i. e., spraying and fumigation, and it has been this resistance to artificial treatment, rather than the extent of territory infested, which has placed them in the forefront as pests of citrus.

This resistance to spraying and fumigation has also had another effect in that it has been a strong argument for an attempt to control the pest by the use of natural enemies. For several years desultory efforts have been put forth to introduce new natural enemies of mealybugs into California from foreign countries, in the vague hope that some one of them might prove effective, as the vedalia did against the cottony cushion scale. The introduction of the so-called mealybug destroyer, Cryptolaemus mon-

The Fertilizer Situation

By A. E. Barnes, Secretary of Fruit Growers Supply Company at Citrus Institute

CONDITIONS governing the supply and affecting the cost of fertilizing materials in Southern California today are world wide. In providing for our future requirements of fertilizing materials, we must not only take into consideration the supply and demand of our own country, but must to an even greater extent give heed to the supreme efforts of Europe to establish once more her agricultural lands on a pre-war basis of production.

In considering the fertilizer situation as it affects our supply in Southern California, we will consider first, the matter of potash, second, phosphoric acid, and third, nitrogen.

Potash

Several years ago while high grade potash was still plentiful and at a fairly reasonable price, citrus fruit growers of California discontinued the heavy application of this material. This reduction in the use of potash was directly due to results obtained at the citrus experiment station at Riverside, which indicated that citrus growers were obtaining but little benefit from heavy applications of potash. Many agriculturists throughout the United States are now reaching the same conclusion, and it was recently stated in Philadelphia that the farmers of Pennsylvania can get along with at least one-third of the amount of potash formerly used and that heavy applications of past years were largely the result of propaganda by interests having potash for sale.

Phosphoric Acid

Our greatest supply of organic phosphoric acid is derived from bones. India has for years been the main source of supply for the world; Argentina is now producing a comparatively large quantity. Transportation difficulties have seriously interfered with deliveries and the increasing demand for bone charcoal for the refining of sugar has created a serious shortage, so that where but a few years ago we paid $32 per ton for bone meal, raw bone is now bringing as high as $70 per ton San Francisco. On January 1 of this year we paid about $60 per ton for bone meal while London paid $82.79 per ton for Calcutta raw bone.

Superphosphate is largely a question of mining, labor, transportation and a sufficient supply of sulphuric acid. Roughly speaking, it requires about one ton sulphuric acid to acidulate one ton phosphate rock. During the period of the war, practically the entire supply of sulphuric acid was used by the government in the manufacture of munitions. Every effort was made to meet this demand so that during the period of the war the manufacturing output was increased to the extent of 2,000 tons per year; but we now have no surplus. The increasing development of the oil industry requires additional amounts of sulphuric acid for the refining of oil. Japan shut off on account of transportation difficulties from her supply of South Sea Island phosphate rock has turned to the Pacific Coast for her supply of superphosphate with the result that this material at the present time is exceedingly scarce.

Nitrogen

During the period of the war the high cost of nitrogen was generally understood, practically all high grade materials being consumed in the manufacture of munitions and the nations of the world were bending their efforts to find ways and means of developing new sources of supply. The signing of the armistice found all the great nations in position to produce more than double the amount manufactured prior to the war.

At that time practically all heavy trading in fertilizers ceased and all dealers looked for a decline in prices. During the following months but few contracts were placed. The factors which led all fertilizer dealers to expect lower prices were fundamentally sound, based on all previous experience. England and Scotland before the war exported a large tonnage of sulphate of ammonia and had doubled their output; also the United States had more than doubled its manufacturing capacity of sulphate of ammonia. In 1914 the United States produced 183,000 tons, in 1919—450,000 tons. Stocks of nitrate of soda in Chile were above normal, and the number of cattle in South American countries, particularly the Argentine, had increased to a figure never before reached. The kill during the war was restricted on account of inability to remove the beef, all vessels being diverted to shorter hauls from ports nearer the seat of war. Fertilizer dealers therefore expected a heavy kill of cattle in South America which would furnish an increased amount of organic fertilizer, the natural market for which would be our Atlantic seaboard states, such as Georgia and the Carolinas, each of which states uses about 1,000,000 tons of fertilizing materials annually. The entire state of California uses only about 32,000 tons of fertilizer per year. The agricultural college of Georgia is now advising farmers to increase their use of fertilizing materials.

Had the South American blood and tankage come to the United States as expected it would have released a corresponding amount in the large meat packing centers of the Middle West. however, it was all contracted for delivery in Europe.

The first movement of sulphate of ammonia in the United States following the signing of the armistice was to our ports for exportation. England and Scotland are consuming their immense supplies at home. England before the war consumed about 80,000 tons of sulphate of ammonia annually; she used 269,000 tons last year. Japan came into the United States market for 100,000 tons for export to that country. About this time the steel strike curtailed the output and the coal strike entirely suspended manufacture in the United States.

In the production of air nitrogen Norway leads the world. To convey some idea of the magnitude of their operation, Norway consumes in the manufacture of air nitrogen from 300,000 to 350,000 horsepower, at one factory alone the blowers deliver 1,000 million gallons of air every 24 hours, and the combined maximum capacity of their different units is one barrel of calcium nitrate every sixth of a second.

We have no accurate information as to exactly what has taken place in Germany, but we do know that during the war, shut off from all outside source of supply, that country was able to produce sufficient nitrogen to meet her heavy requirements for the manufacture of munitions. Last year Germany appropriated an amount equal to $70,000,000 for additions to her nitrogen plants. The United States during the war erected at Muscle Shoals, Alabama, an air nitrogen plant at a cost of $70,000,000. This plant covers three square miles of land. No statement has yet been issued as to the tonnage that can be produced at this plant when operated for the production of nitrogen for fertilizing purposes. The act of congress, under which this operation was created, made the product available only for military purposes. Recently Secretary of War Baker has, through Representative Kahn, asked for an appropriation of $12,000,000 to put this plant in condition for the production of fertilizing materials.

The nitrate of soda producers of Chile fully realize the menace to their market for nitrate of soda and have recently perfected new methods for refining their product which should materially reduce the cost and produce a much purer product than has heretofore been shipped.

Of nitrate of soda France and Belgium within the last two months have purchased up to 500,000 tons in Chile. This makes a total of about one and one-half million tons booked for European countries. This demand for fertilizing materials by these countries is unprecedented and to the writer is one of the brightest spots in the world's effort toward a correct economic readjustment.

Think What Punishment They Stand

HAVE you ever considered how much depends upon the tubes in the tires of a racing car?

No matter how staunch a casing may be, it cannot withstand the punishment inflicted by the track unless the tube, also, is flawless.

During the American racing season of 1919, every important race of fifty miles or more, on speedway and road, was won on Goodyear Cord Tires.

While that is splendid tribute to the Goodyear Cord Tire, it is also proof conclusive of the superior quality of Goodyear Tubes.

As you know, Goodyear Heavy Tourist Tubes, just as the Goodyear Tubes so favored by racers, are made of pure gum strips, *built up layer-upon-layer.*

Their cost is but little more (an average of seventy cents) than the cost of tubes of lesser merit. Do you consider it economy to risk a costly casing to save so small a sum?

Goodyear Heavy Tourist Tubes come in a water-proof and oil-proof bag. Get them from your Goodyear Service Station Dealer. More of them are used than any other kind.

GOODYEAR

HEAVY TOURIST TUBES

The Hawaiian Islands, which each year consume nearly three times the amount of fertilizer used in the state of California, are now dominating the supply of organics from San Francisco north. We cannot compete with prices being paid by the Hawaiian sugar plantations where price is given small consideration where certain goods are required.

Organic fertilizers are today selling at higher prices in all parts of the United States than in California. If this were not the case we might draw a percentage of the blood and tankage from Chicago, the bulk of which is now being manufactured into stock food and the balance shipped to the southern and eastern states. Persons in close touch with the situation estimate that as high as 66 per cent of the blood and tankage produced in the Middle West is being manufactured into stock food. The manufacturers of poultry food are consuming a very heavy tonnage of fish tankage at a price of from $10 to $20 per ton above the prevailing prices for fertilizing purposes.

So acute is the demand for nitrogenous fertilizers in all parts of the world that at the present time the great nations are applying the best chemical talent they possess to the task of reconverting their heavy supplies of munitions into fertilizers to make for production that which they created for destruction. This condition is unique in the history of the world and looks like the fulfillment of the old Bible prophecy "And they shall beat their swords into plow shares and their spears into pruning hooks."

To sum up the situation briefly the accumulation of a surplus of fertilizing materials during the year of 1920 can hardly be expected nor can we expect any lowering of present prices. The large nitrate plant at Muscle Shoals will probably not produce in quantity until 1921. By the summer of 1921 we should begin to experience a heavier supply and a gradual decline in the cost of fertilizing materials.

CONTROL OF MEALYBUGS AND OTHER PESTS

(Continued from Page 425.)

trouzieri, a ladybird found in Australia by Koebele, was at first hailed as a solution of the problem, but this ladybird, like so many such introductions, after the fire "flare-up" seemed to die out, excepting in a few favored locations along the coast, particularly in San Diego County.

In recent years an important introduction was made by the state insectary from Sicily, the so-called Sicilian mealybug parasite, Tanaomastix abnormis. This little parasite has thrived wonderfully and now occurs in practically every locality where the citrus mealybug is found. It has done a great amount of good, but it, too, like cryptolaemus, has been unable to keep the mealybug in complete subjection.

There also occurs in California a number of native parasitic and predaceous insects which feed on mealybugs, the more important of these being the brown lacewing and the hyperaspis, a little black ladybird with red markings. These native natural enemies too, like the introduced species just referred to, at times accomplish much good work, but generally speaking cannot be depended upon, because there are always certain seasons during which their work is not in evidence and it is during these off years that the mealybug becomes a scourge to the grower of citrus fruits.

Now these off years are due largely to scarcity of natural enemies and this scarcity of natural enemies is due to certain biological facts which it is necessary to mention in order to make plain the method to be pursued in bringing about control by the use of parasites.

In the first place the natural enemies of the mealybugs are confined in diet almost exclusively to mealybugs, and their increase in an orchard is entirely dependent uopn the degree of mealybug infestation. Now let us take a given orchard in which there occurs a heavy mealybug infestation and in which there is also a stock of natural enemies, and see what happens. The natural enemies, having available a liberal food supply, increase rapidly, their progeny requiring more and more mealybug food, until by their great numbers they have reduced the mealybug to a condition of scarcity. We then have a condition in the orchard where there are large numbers of natural enemies and a small amount of mealybugs for food. This means starvation for the beneficial insects, with the ultimate result that they die out from the grove. Thus freed from their natural enemies, the remaining mealybugs have an opportunity to again increase unmolested and soon reach numbers dangerous to the grove. Under certain conditions and in certain localities the natural enemies will in time again put in an appearance and reduce the infestation, but this always happens after a great deal of damage has been done.

Now it has always seemed logical that this continual recurrence of periods in which the mealybugs were abundant on account of a scarcity of beneficial insects could be avoided by maintaining a reserve supply of these natural enemies, which could be drawn upon at the proper time, but the stumbling block has always been the maintaining artificially of a sufficient supply of mealybugs upon which to rear the reserve of natural enemies. The problem was solved by the office of pest control of the state department of agriculture through the development of the potato sprout method of rearing mealybugs for food for the beneficial insects. This method, which consists briefly in sprouting large quantities of potatoes in trays and stocking these sprouts with mealybugs, into which the beneficial insects are later introduced for rearing, has enabled us to maintain at all times a supply of certain of the beneficial insects found best adapted to the work. With such a reserve supply on hand it has been possible to bring badly infested orchards to a commercially clean condition and to prevent disastrous outbreaks of mealybugs in orchards where they occur but where they have not yet become serious. This has been repeatedly demonstrated under orchard conditions, particularly in Ventura County, where the work was first undertaken and where the mealybug has been especially severe. For many years the mealybug had been the most feared pest of citrus fruits in the county, and a large amount of money was spent in an attempt to bring it under control. In 1916 a branch insectary was established in Southern California with the object in view of attempting the control of the pest by this method. In the following year the horticultural commissioner of Ventura County succeeded in raising a fund locally for the purpose of building an insectary at Santa Paula with the same object in view. These two insectaries have cooperated in the work, with the result that the mealybug is now under complete control in that locality and is no longer feared as a pest. This same program is being carried out in San Diego County and will soon be under way in the Whittier district of Los Angeles and Orange Counties, with every prospect of success.

Experimental work on the citrophilus mealybug in San Bernardino County encourages the belief that this pest, too, can be controlled by the use of the natural enemies, and for this purpose a branch insectary has been erected at Uplands from funds furnished by the county. This insectary is now in operation and it is hoped and believed that success will attend this effort also.

The methods used in growing the natural enemies of mealybugs are in general very simple, but a good deal of painstaking care is essential, as well as a thorough understanding of the habits of the insects. We use standardized trays made to fit our cages. In these trays a supply of potatoes known to be free from tuber moth, are placed. These trays are then put in a dark room, preferably a basement, where conditions are conducive to the sprouting of the potatoes. In two or three weeks a healthy growth of sprouts is produced, after which these sprouts are stocked with mealybugs. After the mealybugs have gone through a generation and the sprouts are completely covered with the insects, the trays are placed in cheese cloth covered cages and the natural enemies, either the ladybird cryptolaemus or the Silician parasite are introduced. These at once begin to feed and to lay their eggs and within a month to six weeks their progeny

Champion

Dependable Spark Plugs

Did This Ever Happen to You?

WHEN putting in spark plugs, has your wrench ever slipped, banged into another plug and cracked or broken the porcelain insulator?

Champion Spark Plugs stand this rough treatment and do not crack or break; our famous No. 3450 Insulator has been developed and strengthened to such a degree.

Car owners who use Champion Spark Plugs are remarkably free from the ordinary spark plug accidents as well as from troubles due to excessive heat, shocks and temperature changes.

There is a Champion Spark Plug for every type of motor car, truck, tractor, motorcycle and stationary engine. Order a set from your dealer today.

Be sure the name Champion is on the Insulator and the World Trade Mark on the Box.

may be removed and placed in the infested orchards in large numbers. The material thus reared in the insectaries is frequently augmented by collections from orchards where the mealybugs have been cleaned up and the natural enemies are starving for lack of host material. As a general rule orchard colonizations are made in person by a representative from the insectary, but sometimes the beneficial insects are shipped to their destination by mail or express when it is inconvenient to do otherwwise.

As to the future of this work against the mealybugs, it must be remembered that it will not take care of itself. Any slackening of effort will mean a quick return to the old condition of a bad outbreak every few seasons, since it is only by maintaining a strong reserve supply of natural enemies that the pest can be kept in subjection. It is probable that the state office of pest control will always support one or more insectaries in Southern California for the purpose of having on hand such a reserve supply of beneficial insects. It is also probable that many of our larger growers will build insectaries of their own for this purpose, as has been done with success by the Limoneira Ranch at Santa Paula, or that local citrus growers associations will club together for the maintenance of insectaries for their communities, such as the one now being contemplated by several associations in the vicinity of Whittier. There will always be the danger, however, that the mealybug having been cleaned up in a certain district, interest in maintaining a local insectary will wane, with the probable outcome that a sudden outbreak will catch them unawares. The state insectaries will prove useful in such contingencies, and it is also necessary that a certain amount of experimental work be carried on by the state, having as its object the improvement of methods and the trying out of new importations.

The office of pest control is devoting every energy to the solution of these problems, knowing as it does that millions of dollars annually would be saved by a successful outcome of the work now being carried on. However, we can only advise the growers to continue to use the old reliable fumigating tent in the case of these other pests until a method has been worked out in the laboratory and successfully demonstrated on a large scale in the orchard, as was done with the mealybug.

THE BOOM IN WALNUTS

(Continued from Page 423.)

the two varieties, spacing 30 feet apart with rows 60 feet apart. In ten years each alternate tree in the rows would have to be cut out to make a uniform spacing of 60 feet, which is now the recognized spacing for old bearing walnut trees. Leaving the rows 60 feet apart gives room for intercropping, which can safely be practiced for five or six years. Beans are the best intercrop since they do not rob the soil, particularly when the bean straw is put back into the land. They improve the land and require about the same amount of water as the trees. The locality will determine the best variety of beans to plant."

Not All Land Good Walnut Land

Mr. Wylie warned against the danger of walnut planting in untried localities. He said that while it is true that the walnut is grown successfully in many of the interior valleys of California the coastal region is still the region for assured results. The San Joaquin Valley has seen large plantings the past four or five years and in Southern California the walnut is thriving as far inland as Hemet in Riverside County, which has a high summer temperature and a lower winter temperature than Santa Barbara and Orange Counties. Mr. Wylie declared that the walnut is sensitive to alkali and high water tables and that tests should be made before any large planting in new territory is made. The citrus experiment station at Riverside, under the direction of Dr. Bachelor, the well known walnut authority, is making exhaustive tests with a view to finding varieties adapted to inland temperature and localities.

Different Varieties for North and South

I asked Mr. Wylie why it is that the French varieties, like the Franquette and Mayette, were planted only in the north, and why the Placentia Perfection was not planted north of Santa Barbara County.

"Climatic conditions are largely responsible for this condition," he replied. "The north has a shorter growing season, and the French varieties mature quicker than walnuts of the Santa Barbara soft shell type. The long growing season in the south is required to produce the Placentia Perfection. And while the Franquette and Mayette are very fine nuts they do not produce the tonnage that the Placentia does."

New Planting

Mr. Wylie said that some of the largest new plantings in the state are in Santa Barbara and Ventura Counties. The Simi Valley and the region above Santa Susanna Pass in Santa Barbara County and at Camarillo in Ventura County are making large plantings. Considerable new planting is being done at Hemet and Perris in Riverside County and the Chino acreage in San Bernardino County is being extended. There has been a lot of planting done in the San Fernando Valley and some around Pomona in Los Angeles County and some in the lower Riverside district. More would have been done had the trees been available.

It is a rather curious fact that in Orange County, where walnut growing has reached its highest development, many hundred acres of beautiful wainut groves have been cut down the past three to five years. This is not because the walnut has not been profitable, but because the Valencia orange finds in Orange County a singularly congenial habitat, as evidenced by the market reports on Chapman's Old Mission brand and other well known Orange County Valencia packs. But even if one admits that Valencias are more profitable, he can only feel a keen sense of regret at seeing fine producing walnut groves of from a dozen to 20 years of age ruthlessly removed to make room for oranges.

Cooperation Success Keynote

Any review of the walnut situation in California would be incomplete without due credit being given to the Walnut Growers Association. In a state where cooperative marketing has reached its highest development the California Walnut Growers Association stands pre-eminent in the service it has rendered to the growers who compose the organization. Not only has the association developed and stabilized the walnut market, advertised the product under the well known Diamond brand and reduced packing to such an exact science that one is absolutely sure in buying Diamond brand nuts that he is getting fully meated nuts; but the association is also rendering invaluable service to the 80 per cent of California growers who compose the organization in the field. Field workers like Mr. Wylie, who is quoted above, cover the entire field, advising growers as to cultural methods, irrigation and other production details. And the cost for all this to the grower is infinitesimal as compared with benefits received. It is not too much to say that the association has been the one great determining factor in making walnut culture the great industry that it is in California today.

APPLE MEN TO MEET

For the purpose of establishing a more uniform system of inspection, greater cooperation, and a clearer understanding between apple growers, packers and shippers in the enforcement of the Standard Apple Act of 1917, the director of agriculture has appointed a committee to meet at Watsonville on March 18-19, 1920. The committee consists of representative apple growers from the Pajaro Valley Sonoma County, Napa, San Bernardino, Los Angeles and San Diego Counties, also horticultural commissioners from the various apple producing counties.

Some of the most important questions to be considered are: Adoption of a certificate of inspection similar to the one employed by United States bureau of markets; car inspection versus packing house inspection; how long is the packer responsible for his product after fruit has been packed?; adoption of uniform procedure in prosecuting violators, and uniform methods of condemnation or other disposal of fruit packed in violation of the law.

COOPERATIVE CANNING

Developments of the past week have practically assured the establishment of a new unit of the California Co-operative Canneries at Modesto and the organization of an association of the peach growers of that district to be known as the Stanislaus Growers Association. There has been considerable interest shown in that district during the progress of the active campaign in the Santa Clara Valley, and as a result representatives of the Co-operative Canneries—Dallas H. Gray, a grower of the Hanford district, and Harold T. Johnson, an apricot grower of the Santa Clara Valley—have been spending some time in Modesto assisting local growers in the work of organization. A few days ago a representative committee of growers, including T. K. Beard, J. W. Murphy, W. H. Frazine, M. S. Amerine and L. W. Pitts, visited the big plant of the Cooperative Canneries in San Jose, interviewed members of the Santa Clara Valley Growers Association and thoroughly investigated all of the different phases of the business.

On Wednesday evening, February 25, a mass meeting of growers was held at Modesto, attended by over 100 representative peach growers, and as a result an organization was formed and the erection of a cannery at that point decided upon. It is expected that not less than 2,000 tons of cling peaches will be in the new association in addition to apricots, pears and other canning fruits, and it is planned to build a cannery at a cost of approximately $150,000, which will be very similar to the plant now being built at Visalia.

The organization work at Visalia has now been completed and construction on the new cannery will be started within a few days. This is a remarkable victory for the cause of co-operative canneries, as the results have been achieved in the face of the most bitter opposition. The results of the season of 1919 at the big cooperative plant at San Jose, where the average prices returned to cling peach growers ranged as high as $137 a ton, and the further reports from the canneries in Southern California, which have now completed their fifth successful season of operation, are most encouraging.

BERRY PLANT SHORTAGE

"No logan" is the slogan of the dealer when he is asked about berry plants. There has never been such a shortage of loganberry plants known. The price went up to $100 a thousand and then the supply gave out. The last plants to reach Los Angeles came from Portland, Oregon, and the grower receiving these is unable to plant the number contemplated and many others have the same complaint. There also are no Brandywine strawberries to be had and a general shortage and late receipts are reported by all. The growers now planting would have completed the work a month ago had the stock been available. But all are jubilant over the late rain, which was of inestimable benefit to the berry grower.

PLANTING STRAWBERRIES

In the warmer sections of the state strawberry planting commences in January and continues as long as the weather remains reasonably cool. This year planting was late, largely dependent on rains. Strawberry plants are hard to establish in hot weather but so long as rains continue there is no limit to the season.

One of the most important features of the work is to do the fertilizing before the plants are set; strawberries are not easily fed when they are growing. Light doses of nitrate of soda may be given, but heavy doses will provoke a foliage growth. One unusually successful grower put 100 tons of fine cow manure, fresh from the corral, on an acre, with splendid results. He also put a like amount on three acres with good results. In some of his crops the returns were as high as $2,700 an acre, but of course the season's prices largely govern the monetary returns. Such heavy fertilizing, however, insures a good crop for four years after application and planting. The one thing most necessary to strawberries is humus, of which they need an enormous supply.

In planting practice varies much as to distances. We find many growers planting rows on ridges three feet apart with irrigation furrows between and plants 12 or 14 inches apart in rows. But the successful grower mentioned planted on the level, in rows 20 inches apart and plants ten or 12 inches apart, generally the latter. He claimed he could irrigate and pick most advantageously with rows so spaced. Set out in February one will get a crop from May to July. Of late years some growers on a small scale have juggled with the water supply, withholding it to enforce a rest of the plants and then giving a copious supply, yielding a crop out of the normal season. In favored localities this has brought winter berries. One grower reports setting out plants in November and getting a limited crop the last of March and a good crop on to July 15. But winter berries, so-called, are wholly dependent upon control of water supply.—E. B.

THE SPRAY GUN

The Australians don't like the spray gun. The Agricultural Gazette of New South Wales refers to the possible utility of the spray gun and that it has been under consideration for some time at the Glen Innis experiment farm. It was "imported from America." After giving more or less extended reference to the experiments as they were tried, the conclusion was reached:

"The gun was not considered satisfactory. Its great advantage would be in acting as a long distance nozzle so that high trees could be sprayed without the use of excessively long and cumbersome rods or towers; but the highest tree in the test block was 12 feet, and, while this was quite the limit to which the gun would throw a spray, trees of equal height can be sprayed with rods of moderate and not unwieldly length. Again, the work done by the gun appeared to be faulty near the tops of the 11 to 12 foot trees, while one cannot spray downwards onto the tops of the trees with a gun from the ground as one can with an angle nozzle on a rod. The operator also found the gun far more tiring to use than the rod and nozzles.

"The day on which the test was carried out was almost calm, but even so the operator with the gun could not avoid the spray, and on a fairly windy day on which the gun was previously used he was literally soaked with spray. It would be impracticable, therefore, to appiy caustic sprays, such as lime-sulphur, except in very calm weather. With an angle nozzle on the end of even a fairly short rod, the operator can avoid the spray to a great extent."

When Time is Precious—
E-B Osborne Hay Tools Save It

Every farmer who has a crop of hay wants tools that finish the job in record time. That's why E-B Osborne hay tools are universally appreciated and bought. They do quicker, more thorough work all the way through.

The name Osborne has long stood high in the estimation of American farmers. Coupled with the E-B trademark it insures an unsurpassed standard of excellence and service.

The E-B Osborne mower does its work efficiently, no matter how heavy the crop. It has many special festures which you should investigate, such as internal gear drive, eccentric for realigning cutter-bar, extra long knife head and guides, full strength one-piece frame.

Any E-B dealer will show you this mower as well as the other implements pictured here. Ask him about E-B Service on deliveries, both of machines and parts. It is of real importance to every farmer who uses haying tools.

A complete line of farm machinery manufactured and guaranteed by one company.

E-B Osborne Sulky Rake

Steel wheels, 45 inches high, with staggered spokes; hold true circle and pull easily on rough ground; Truss-rod, and one-piece frame give strength for many years of service. Three spacings of teeth by adjustment.

E-B Osborne Grain Binder Gets Down Grain and Tall Grain Equally Well

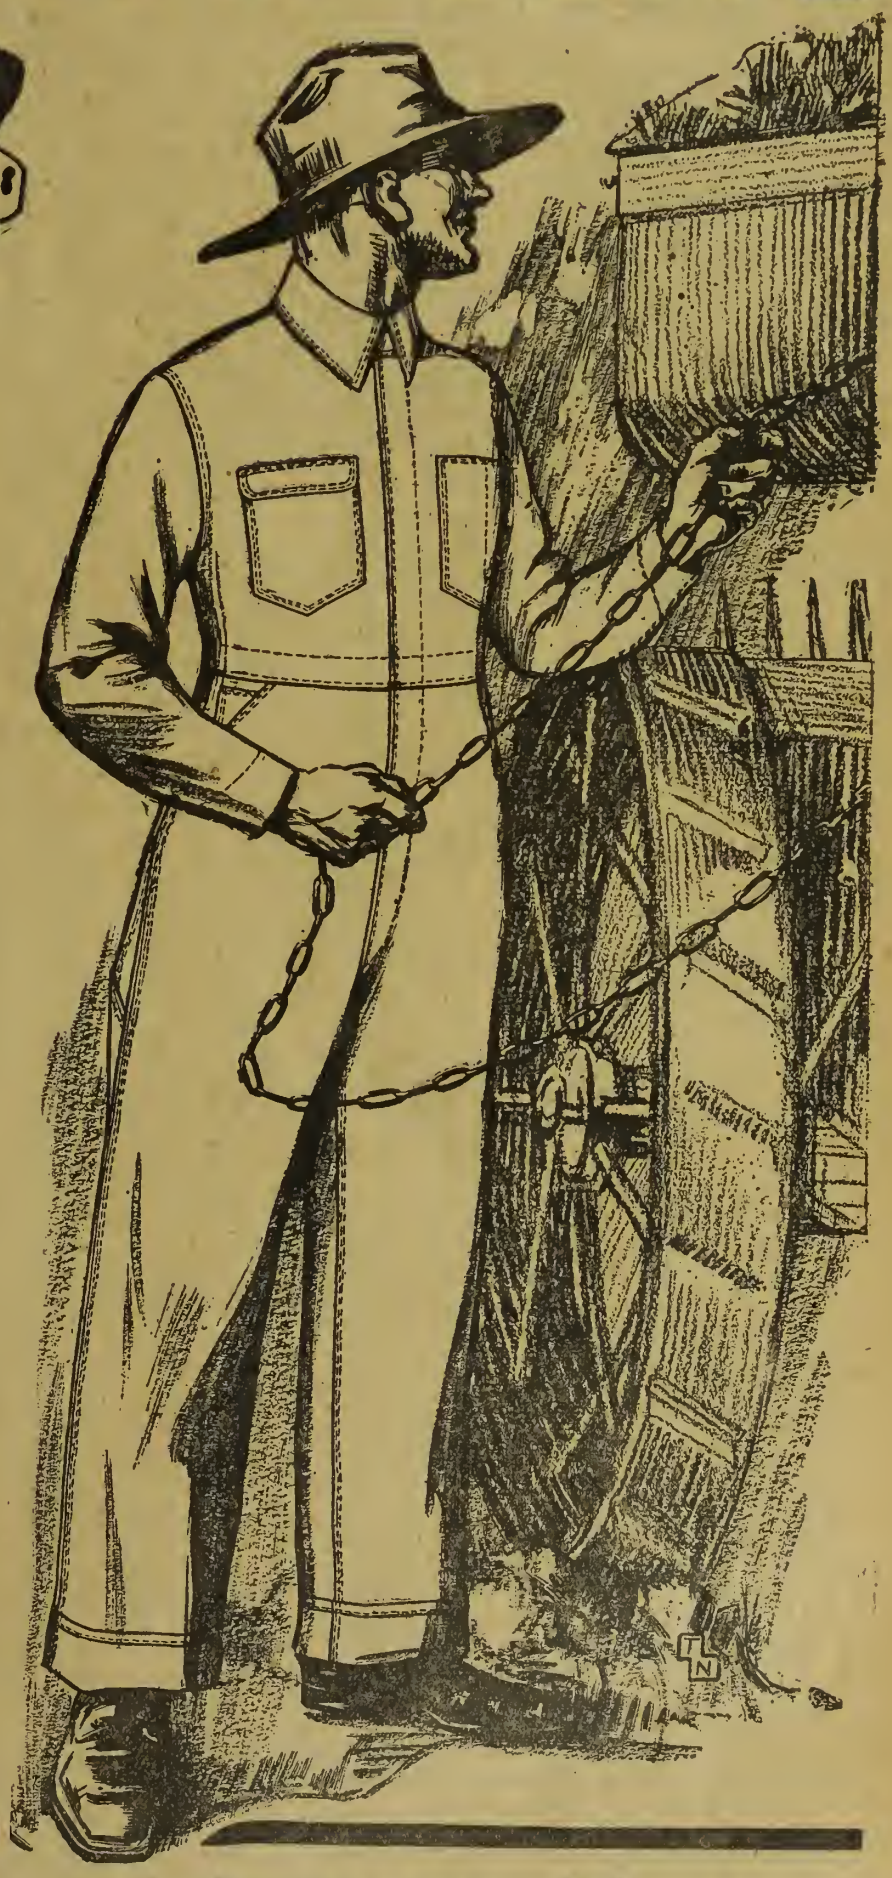
These special E-B Osborne Grain Binder features get practically all the grain regardless of conditions.

Cutter bar close to ground. Reel pushes down grain onto platform. Platform canvas runs one-seventh faster than elevator straightening grain. Stringing grain prevented by drop leaves, grain springs, three discharge arms.

EMERSON-BRANTINGHAM THE E-B LINE FARM MACHINERY

FINCK'S

DETROIT SPECIAL COMBINATION SUITS



The Most Practical All-round Farm Work-Garment

"They Wear Like a Pig's Nose"
—Guarantees the Longest Wear

Anywhere—on any farm—at the chores, in the field, summer or winter, Finck's "Pig's Nose" Combination Suits are the most practical work garments you can buy.

They are comfortable to a degree that's amazing. In summer they can be worn over thin underwear without any other clothing. A clear circulation of air through entire length makes them cool to work in.

They are roomy. There are no tight waist belts. You can stoop, bend, pull or strain, and they will not rip or tear, bind or cut. Nine large pockets add to their convenience.

They are just the garment you need around the barn and at threshing time. The collar fits snugly; adjustable ankle and wrist straps give absolute protection to body from dust and prickly chaff.

You can get these long wearing Finck's "Pig's Nose" Combination Suits in khaki, blue, hickory stripe or white. They cost less in the long run.

Ask Your Nearest Dealer to Show You These Garments. If He Hasn't Them Write Us and We Will See that You Are Supplied

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

ON AGAIN

The income tax is off again, or will be before midnight of next Monday. On Tuesday morning it will be on again, will be, at least, if we are wise. Of all the maddening things resulting from the war this income tax "return" is a bit the worst. The only one entitled to grin in making out these reports is the man who keeps books and knows, and knows he knows.

STATE RAIN

Monday saw the beginning of a wonderfully fine rain. It came down the coast in a good old time coast storm way. The precipitation at Eureka was .86, Red Bluff 1.12, Sacramento .72, San Francisco .94, Fresno, .64, San Luis Obispo .88, Santa Barbara .55, Los Angeles .66. All citrus sections of the southern part of the state received from three-fourths of an inch to one and one-half. The Sierra Nevada and Sierra Madre are glistening white and apparently the snowfall has been heavy.

DEPRECIATION ON TREES

Orchardists are generaliy making deduction from gross income to cover not only depreciation on buildings but depreciation on trees and perennial crops. This depreciation ranges from two to ten per cent or even more according to the particular crop. On walnut trees, for instance, it is two per cent, which allows for 50 year productive life of the tree. Depreciation on citrus groves is considered greater, some growers maintaining that three to four per cent is just. The Navel is considered hardly as long lived a tree as the Valencia.

COLD IN FLORIDA

A recent blizzard covered practically all of the eastern side of the United States. Even southern Florida got some nipping blasts. The bureau of crop estimates reports the minimum temperatures on March 2 as 28 degrees at Sanford and 27 at Miami. Sanford is well north of the middle of the state and inland some distance from the Atlantic, but Miami is well toward the southern extremity. The vegetable crops of the entire Atlantic side of the state were destroyed or greatly injured. The Gulf coast has not suffered so severely.

BIG BUSINESS

The farmer sometimes inclines to regard his own as one of the lesser industries. There is so much made of the great aggregations of capital brought under one man's direction in handling steel, oil, etc., that farming takes second place. But, as a matter of fact, the value of farm properties is greater than that of all manufacturing establishments, railways, mines and quarries of the United States combined. The greater portion of the wealth which financed our own war and of the billions loaned to Europe was originally dug out of the soil of the American farm.

BUY TREES

Many an orchardist would have planted orchard trees this year had he been able to secure them. Some even went so far as to make all plans for the new orchard only to learn that not another tree was to be had. These orchardists have already turned to the nurseryman and made contracts for next year's delivery. As it takes two or three years to produce a good nursery tree, it is possible that another year's shortage may affect some planters who are not forehanded enough to plan ahead. There will be no dependable trees which can be had for a low price for the next year. The wise planter will be making his contracts early.

GROW BOB-CATS

Walt Mason, or Cicero, or somebody once said that the best way to reach a man's heart was through his stomach. So far as we know, this has never been denied. Some equally as wise have suggested that the way to his pocketbook was through his vanity, and we believe that therein is a stronger pull. This thought is suggested by a letter from a subscriber who lives up in the San Diego County mountains. He remarks that while he can secure only $7 for a good cowhide —and adds, "It must be a mighty good one to bring that amount"—he can sell a good bob-cat skin for $8.50. Perhaps our dairymen should cease producing milk and cowhides and go to growing bob-cats.

BUD SELECTION

Big folks are doing big things along many lines in this state. One of the latest moves, which means much to the state's future, is that of the largest nurserymen in the state—in the world—uniting in order to secure through bud and stock selection the foundation for nursery trees which will mean a greater production of finer fruit. A story of this movement was planned for the present issue of the California Cultivator, one of its features to be photographs of some of the men most responsible for the advancement of the movement, but one photograph did not arrive in time, that of the manager to be, L. B. Scott, at present with the United States department of agriculture. In fact, it has just reached us as we are going to press and is now in the making for next week's issue.

Review of the efforts at bud selection, and especially of the scope of this organization, will have much of interest for the readers of next week's paper.

BUILD A SILO

Twist or turn as we will and develop water from every possible source, this will be a dry summer. Presumably there will be less alfalfa and although the recent rains have assured many a hay field, there will still be a shortage of grain hay. Millions of California livestock, while not actually hungry, may not put on as plentiful streaks of fat as the consumer desires.

But the situation may be helped very materially by planting more soiling crops and more sorghums or other large grasses for pasturage and for silage. We predict there will be a greater building of silos than any preceding year.

It is none too early to have plans taking definite shape. Let it be a pit in the ground; let it be built of brick, of concrete, of wood or of iron; but let it be something to hold feed to take the place of $40 hay. Even some of the weeds make excellent silage. First alfalfa cutting with a liberal sprinkling of foxtail has been declared one of our best silage crops.

POWER WANTED

Dealers in "white coal" and growers of food, together with a number of manufacturers or users of electricity, are consulting as to best method of securing greatest good from the reduced service made necessary by the drouth. It seems to us that the country's best welfare is secured by giving the farmers first chance. The practice has thus far been, however, to restrict irrigation, where it depends upon electricity, to hours in which large industries of the cities were not using the current. This may be to the profit of the companies delivering the electricity, but it is not to the best interests of the state at large.

The state railroad commission has issued the following statement:

"State and federal agencies are united in an endeavor to make all available water perform the highest duty and produce the greatest beneficial returns from the standpoint of the welfare of the state as a whole.

"Among the water conservations outlined in the statement are:

"Farmers should defer putting new land under cultivation this year.

"All flowing wells should be immediately tapped.

"Night irrigation should be practiced in order to reduce the peak power load and prevent waste of water.

"Long lived crops should be given special care.

"Irrigators of rice lands which have become fouled or partly fouled should rest these lands for the present season."

DUST with Nico-Sulphur

APHIS

RED SPIDER

Save your citrus crop from the ravages of red spider and aphis — dust with Nico-Sulphur, the new discovery that will revolutionize the work of pest control.

Costs less than spraying and is much more effective.

Dehydration

WHAT is dehydration? We asked Dr. Clements of the agricultural department of the Los Angeles chamber of commerce this question and he answered:

"Dehydration means the reduction of organic materials to a desiccated condition without alteration of cellular structure or chemical change. In other words, the elimination of the greater part of the water content."

In addition, Dr. Clements said:

"Two years ago, while under stress of war, the British government made some interesting and very successful tests in the dehydration of berries and other highly colored fruits and vegetables in an atmosphere of nitrogen, but the process was far too expensive to be utilized in general manufacture. The object of the British government at that time was to overcome the enormous cost of $3,000 per car Los Angeles to Port Sarnia—recognizing that one carload of dehydrated berries would be the equivalent of 20 carloads of the fresh iced material, the strawberries having been frozen in barrels and kept so until ready for preserving. I might add that the expense through dehydration in nitrogen was much greater than the $3,000 under icing.

"The necessity for this neutral atmosphere is due to the coloring matter of all fruits and vegetables being iron and iron salts, and to the instability of their chemical formation and susceptibility to oxygen and ozone. In any dehydration, either electrical or otherwise, in which there is vibration or artificial wind drafts, the excess of oxygen, and a still more deleterious product—ozone—results in the bianching of the product.

"The International people seem to have stumbled upon this one principle accidentally—the use of carbonic acid gas, being a by-product of simple combustion in the creation of heat within the dehydration plant itself, carbonic acid gas being so much heavier than the normal atmosphere, forces it to the top of the container and excludes any possibility of ozone or excess of oxygen. Another item of interest is the embodiment of the humidor principal, which has been accepted, lock, stock and barrel, by the United States government in the kiln drying of all woods necessary to the airplane. The humid atmosphere moistening the superstructure or envelope of the material to be dehydrated stimulates capillary attraction, making release of retained moisture even, and a uniform product results.

"This makes a very complicated problem and places dehydration directly in the hands of the chemist and biologist."

The broom corn factory at Lindsay, Tulare County, is being operated on corn sent in from other sections, but it is expected that several hundred acres will be planted locally this year, some of it interset in orange groves.

Five hundred acres of cotton is to be planted by a large cotton seed manufacturing concern at El Mirador, Tulare County.

BRISCOE

There are many features about the new 1920 Briscoe that make it a thoroughbred farm machine. Its exceptional light weight combined with its sturdiness means certain economy and low upkeep cost. Its world-famous unit power plant means dependability when road conditions call for unusual power performance.

"Before you decide Take a Briscoe ride"

You will find the Briscoe a utility car too—a car just right for farm use and one the whole family will thoroughly enjoy. There's a Briscoe dealer near you who will show you and prove the Briscoe. Write us for his name and address, and new Briscoe catalog, which accurately describes the Briscoe and illustrates the many exclusive features.

GRANT SIX

FOR a number of years the Grant Six has been one of the most popular cars selling to farmers, because it has always been remarkably good value at a reasonable price.

This year's car is by all odds the finest Grant Six that has ever been built. The high radiator and hood with aluminum molding give a new touch of distinction and with the long, low body lines, make a decidedly handsome and stylish car.

The famous Grant Six overhead valve engine has been steadily refined and improved until it is one of the most flexible and responsive motors ever put into a car. It has power and speed beyond what most men will dare to use.

The Grant Six is an ideal car for farm use because of its remarkable spring suspension. The rear springs are underslung and 56½ inches long—the longest springs ever used in a car of 116 inch wheel base. When the rear seat is filled the springs are flat so that the full spring action is obtained and the car travels over rough, bumpy roads with utmost comfort.

This model exceeds in wheel base and in size any former Grant Six.

In buying the Grant Six you get a car you can be proud of, a car that will satisfy you completely—a powerful, roomy, speedy, comfortable car of unusually fine appearance.

Write for new illustrated catalogue and name of Grant Six dealer in your community.

Lawn Making

By Ernest Braunton

As one cannot well get into the soil after a lawn is made it should be well stirred, aerated and fertilized as a preliminary, and March is the best month for the work. No soil can be too deeply worked or given too much airing; therefore turn it up deeply and let it lay for a few days or a week. Then do the same thing over again and in the doing work in barnyardyard manure, if available. Nothing less than a four inch coating should be given, and before the lawn is ready for planting this should be spaded or forked into the soil several times. At first two spadings do not break up the lumps, but allow air to get into the soil. But two more turnings of the soil should be given and in both these the soil should be pulverized as finely as possible. With soil given such preparation we have the foundation for a lawn that cannot well be made better.

Though preliminary work is hardest in heavy soils, blue grass grows better, larger of blade and darker of color than in lighter soils. I have known an experienced lawn maker haul in adobe to cover a sandy tract, four inches deep, after heavily fertilizing and stirring the light soil beneath.

Danger to the future lawn lurks in dairy manure. Nearly all dairies are situated in lowlands where Bermuda grass is prevalent, and if you wish a Bermuda grass, may good luck go with you. If you wish to escape this pest, however, keep your fertilizer well wetted for some time, turning over occasionally. All seeds that do not sprout in the manure will grow in the soil. Fertilizer works turn out a special lawn fertilizer, or to supplement animal manures raw bone meal evenly scattered over the surface and well worked in is a good grass food and also is available for some time as its decay is not rapid.

Smoothing and Sowing

We will presume your soil is now ready to be smoothed for sowing. Be sure that it is properly settled, no soft spots. If these are suspected tread over the surface with the feet close together, to search these places out. On large lawns rollers are used but these do not find the soft soil pockets as do the feet. Rake the low spots full of soil and tread them firmly. The surface must be raked over to pulverize it finely and get a smooth plane. You cannot do this after the grass is sown; as you leave the surface so will it always remain, except it may settle unevenly. It never will improve in smoothness.

After soil surface is prepared, walk upon it no more. Put boards at the back end of the area and begin sowing, coming forward by alternating the two boards or two sets of boards until you have sown the lawn without putting a foot on it. Sow on a windless day or in early morn before the zephyrs blow if you are using blue grass seed, but if you sow clover the seed is heavy enough so it will not blow about. In mixed lawns sow the two kinds of seeds separately. Before sowing grass seed sprinkle the surface lightly and the seeds will stick to the damp soil, lessening the danger of congestion in case light breezes come.

Before you begin your retreat with the boards rake the seed lightly into the surface, very lightly, or you will pull the seed-laden soil about and have a patchy crop. The cover should also be scattered on each section as soon as sown. The best material for this is an inch of finely sifted manure. Shavings from planning mills are often used but are by no means as good or of equal food value. Beware of redwood shavings, and all shavings are best wetted and leached a few days before using, giving them an abundance of water. Great care must be taken with the first and subsequent waterings given before the grass is up as the cover and the seeds are easily driven about and too much water in a place will float both and your grass will come up in patches. As soon as weeds are large enough to pull, go after them, using one board to kneel on and another to keep your toes from digging up the soil. As

Eureka Lemon Demonstration Tree Grown by J. P. Englehart

This tree is composed of three growing buds of the three different types of wood found in the Eureka lemon tree, namely fruiting wood, sucker wood and white wood, which produces leaves mostly and very little fruit. Note the great distance the sap travels in both the latter kinds of wood, before it forms leaves and fruit. These poor wood branches are both supported artificially. Note also how the good fruit bud makes a vigorous growth and dominates the whole tree. Nature makes a distinct effort to reproduce the tree by giving dominance to the fruit growth. Conserve the species and make poor wood recessive by not permitting it to reproduce itself—all these messages for pruners are read in this tree.

soon as the young grass is high enough to catch the mower, cut it. But tread very flatfooted when you do so as not to cover the smooth surface with ugly heel marks or torn spots.

If you can roll it before mowing there is less danger of injury. Roll with a light pressure at first and then with a heavier one. One pound of blue grass seed will cover 200 square feet or an area of ten by 20 feet. One pound of clover is enough for an area of one-half more, or 300 square feet. Sow late in March or early in April. If these directions are followed closely a high class lawn is assured.

GARDEN IRRIGATION

Everything in a vegetable garden should be planted in rows, for this arrangement makes easier every operation from seedtime to harvest. In the average home garden the runs of water are seldom too long, but in the commercial field they should never extend beyond 200 feet or the end nearest the supply will get too much and the outer end not enough.

The distance between rows will of course be governed by the kind of crop and the method of cultivation, irrigation being a secondary consideration. If no draft animals are used the rows may be closer together, saving land and water and obtaining a heavier crop per acre. If both land and water are cheaper and more abundant than labor, have the rows far apart and use a horse or horses for cultivation. The steeper the land the shorter should rows be for irrigation, and the smaller the stream used.

Keen judgment is required to determine how often water should be applied for many factors enter, but as a fundamental principle irrigate as little as possible and yet attain maximum results. Nearly all truck crops on flat or level lands are irrigated too much by the amateur grower, especially during the cooler months, for water in the soil lowers its temperature and retards growth by reducing heat and excluding air. It is about the first of May in the average vegetable garden, in normal years, that one should begin to consider irrigation a serious matter. Before that time on well conditioned soil there is enough moisture to germinate seeds and keep the young plants growing, and so long as they grow vigorously do not irrigate but do not allow them to suffer for need of water. Of all garden crops strawberries need most frequent irrigations; in some soils it is necessary every three days during the bearing season.—E. B.

ASPARAGUS CULTURE

Planting may be done any time from the first of the year to April, but early planting is best. A deep sandy loam is preferable if a choice may be had, but any fairly free soil will do. Many growers set the plants in rows four feet apart, and where land is cheap and plenty of it available some plant at six feet, while the home garden is set at three feet. The furrows should be 12 inches deep and the plants set on the bottom, a foot apart. Cover with an inch or two of soil and on top of this put three inches of good stable manure mixed with soil. This is all that is usually done the first season in the field, but the gardener gradually adds soil until the furrows are filled.

Use one year old roots and never allow plants to suffer for water. If planted about January 1 a crop may be picked April 1. Continue cutting until sprouts are too thin for good eating and then allow tops to grow until fall though a spray with powdered sulphur in August is a wise precaution to guard against mildew, rust or red spider. In November cut all stalks and burn them.

Fertilizer may be applied at any time and nothing surpasses in value stable manure. It is generally agreed that February is the best time to fertilize. Salt is used in the row at the rate of one ton to the acre. Kainit to half that amount has also brought good results. A well made asparagus bed or field will yield well for a quarter century if one remembers the plants are gross feeders and applies plenty of plant food.—E. B.

WOMAN SUFFRAGE IN BELGIUM

The Belgian chamber of deputies has passed a bill granting communal suffrage to all citizens, including women. Voting at elections is compulsory.

A Case Thresher—
The Tractor's Faithful Working Mate

Many a tractor owner could materially increase his profits by the purchase of a Case Thresher, of suitable size.

Case Threshers are built to exactly meet the requirements of the farmer who threshes as part of his farming, or the thresherman who wants a rig of greater capacity and efficiency. There are six sizes, ranging from the 20 x 28, suitable for the large farm or a group of small farms, to the great 40 x 62 the climax of the thresher achievement. Case, Galvanized, Steel built, Grain Saving Threshers are made in the following sizes: 20 x 28, 22 x 36, 26 x 46, 32 x 54, 36 x 58 and 40 x 62.

All sizes of Case Threshers may be equipped with Case Self-Feeders, Wind Stackers and Grain Handlers. All will thresh, separate, clean and save all grains and seeds. And for each size of Case Thresher there is a Case Tractor as a dependable and durable source of power. Three sizes of Case Kerosene Tractors and eight sizes of Case Steam Tractors offer choice of requirements for all conditions and localities.

Send for booklets giving detailed information regarding Case Threshers Case Kerosene Tractors, Case Steam Tractors, Case Baling Presses, Case Silo Fillers, etc.

TRACTOR PLOW

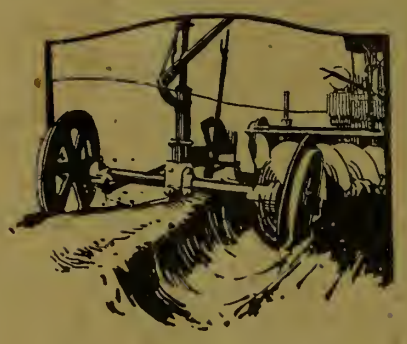
—an all-purpose plow

The "Caterpillar" Tractor Plow is more than a general purpose plow—it is an all-purpose plow. Not only does it combine in one set of equipment a disc plow and a moldboard plow—it also has a wide range of adjustable features that still further increase its usefulness. And its performance in the extraordinary jobs of power plowing, as well as in the ordinary, every-day work, proves its adaptability to every kind and condition of plowing.

"Caterpillar" Plows are successfully plowing the hardest adobe lands, working on steep side hills, in soft tule land. They are handling salt grass and Bermuda grass, plowing sage brush land in Nevada, rocky land in Hawaii. They have the strength and clearance for exceptionally deep plowing. And—of chief importance—they have the dependability for continuous, trouble-free service in any kind of plowing.

Low plowing costs are possible only when a trustworthy plow permits uninterrupted operation of the tractor. Waiting on a plow's weaknesses is expensive. You don't have to wait for "Caterpillar" Plows; they are built to do your plowing, whatever may be your conditions.

A new catalog of "Caterpillar" Plows is ready; send for it.



Four-wheel design, an exclusive, patented innovation which absolutely prevents tailing, enables "Caterpillar" Tractor Plows to plow straight, perfect furrows in any kind or condition of soil, on any grade. Always—it is possible to keep the plow in the furrow and the tractor out of it.

Big, dust-proof bearings reduce wear to a minimum. Upkeep is so light as to be practically negligible. Trouble is so rare that you will never become familiar with it. Economy of operation and perfection of work are outstanding features of "Caterpillar" Tractor Plows.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Use of Explosives

The use of explosives in agricultural practice is becoming more general and we are glad to say that we can secure for inquirers answers to problems which may come up by those who are expert in doing blasting whether for removal of stumps, lifting of hardpan, ditching or other work.

Cut Worms

What can be done to control cut worms in garden?—Subscriber, Acton.

Here is method of procedure given by Mr. de Ong in the California Cultivator of May 24, 1919: "Fat, greasy, naked caterpillars which feed on the stalks of young tender plants. These worms work at night and through the day are found buried an inch or two in the ground just at the base of the last plant fed upon. By scraping away the soil the worm can usually be found and killed. Poisoned bran bait is most effective when they are abundant. For small areas mix four pounds of wheat bran, three ounces of white arsenic, one pint of strong molasses and about three quarts of water or enough to form a crumbly mass. This bait may be scattered around the plants where the cut worms have been feeding or, better still, broadcasted over the plot before planting. Dried lumps of the bait should be gathered and destroyed as this is dangerous to poultry and other animals. Fresh green alfalfa dipped in a solution of arsenic, one ounce to five gallons of water, has given good results when scattered about the garden after night. Finely sliced raw potato dipped in the powdered arsenic is also of value."

Abbreviation in Market Report

Will you please tell me what @ means between two prices in the market reports?—Subscriber, Posey.

Webster's International dictionary says: "@, at or to; as silk @ $2 per yard; flour per bbl. $8.00@$10.50." It is simply an abbreviation which saves an extra letter and a little space in the market reports.

Pruning Olives

What month would you advise pruning olives and what is the latest date at which it should be done? Trees are seven years old and bore a good 1919 crop.—P. K., Hemet.

Pruning may be done at any time after fruit is picked until the new growth starts or even after the new crop is setting, though the latter practice should be avoided if possible.

Spraying Apples

I have about 25 apple trees that were very wormy last year. What would you advise? If spraying is best, when and how many times should it be done? The trees are in good condition, but a few of them have borers.—Subscriber, Gridley.

The best treatment for the borers is to kill by inserting wire and then keeping trunks of the trees covered with a repellant or surface which prevents further inroads. As to spraying for the codling moth we quote from the issue of December 13, 1919: "The best spray is an arsenate, formula for which was given in the spray special of the Cultivator of August 9. It should be applied when the petals are falling from the blossoms, again about ten days later, and again about three weeks later. The number of sprayings and the time of application varies, however, in different sections, but we heard one Los Angeles County grower assert that his apple trees, sprayed as above indicated, gave absolutely 100 per cent worm free fruit."

Spring and Summer Pruning of Apricot Trees

By C. C. Miller

WITHIN a short time now the bloom will be over and the apricot trees will start their vigorous new growth. The general custom has been to allow all the spring and summer growth to continue unchecked and in the winter time put the tree in shape with one operation. In this article the writer will endeavor to give reasons why this practice should be modified to the extent of going through the trees during spring and summer and in a simple manner checking the excessive and useless growth.

While working with trees we should bear in mind that a tree is a living, breathing, sensitive being and is influenced by every outside operation or climatic condition that reaches it, and if the fruit wood low down and in the

center of tho tree is to develop properly for next year it must have room; it must have some direct sunlight and proper air circulation. Nature's way is tho best way, but man has through many generations of cultivation selected the best tree and the best fruit and changed the natural habits of the apricot tree and compelled it to perform as it could not in its native jungle and survive; for this reason and to just that extent we should care for it and correct its eccentricities. To allow a highly selected fruit tree to grow without intelligent care and without correcting its abnormal habits of growth means an early ruin to a valuable tree.

Water and cultivation, fertilization and pruning will this year have a direct influence on next year's crop. Without sufficient water the developing fruit wood suffers first and if shut off from proper amounts of sunlight the fruit buds are not strongly developed. Again, what grower has not gone through an orchard after a light crop followed by excessive wood growth and found valuable fruit wood dead and dried up in the center of the tree? It must be conceded that it will take several years to replace this loss. Besides much tree energy is wasted at pruning time when the excessive sucker growth is taken off.

Just how much excessive sucker growth is detrimental to the fruit bearing activities of the tree has not been settled. The sucker commands its share of crude sap when there is a shortage and sheds its leaves last. This it seems would tend to indicate that the innate inclination of the apricot tree was to reach out and produce new wood growth. Pruning methods should aim to discourage wood growth and stimulate fruit bearing. Some water is drawn from the green fruit to help supply the leaves on a hot day when there is an insufficient water supply. When the fruit is ripening it holds its moisture at the expense of the new wood growth and if the shortage becomes serious the tree may not be able to retain all its leaves. Again in this case the long sucker growths are the last to lose their leaves, indicating that they command their share of the crude sap at the expense of the rest of the tree.

Now supposing that there is a partial defoliation at fruiting time, caused by an insufficient supply of crude sap. After the fruit is picked the suckers recover first and send out new leaf whorls near their points. In other words, they command what sap there is and the hard fruiting wood must wait until a normal condition is again reached before receiving sufficient stimulus to send out new leaves. Many times the hard wood does not send out new leaves and in consequence the fruit buds for the coming year are not properly developed. The same number of blossoms may appear in the spring, but my contention is that without an adequate supply of stored up food from the preceding year the tree is not able to give the young fruit buds the initial boost, so to speak. Not having a good start they are more susceptible to fungus attacks and will not cling to the tree so well under adverse climatic conditions. If useless suckers are removed in the spring before they are a foot long by simply jerking them out clean, the tree may be kept more nearly within its own bounds, roots and tops in balance, as the dry fruiting season approaches. Then at this time when there is the greatest need for an abundant sap supply the roots will be more nearly able to furnish it.

The center of the tree must be kept open to admit some direct sunlight during the day and free circulation of air. The upflowing crude sap, water and the necessary mineral matters in solution has no food value for the tree until it has been elaborated in the leaf, added to and changed in the sunlight. Without proper air circulation the leaves cannot absorb the needed gasses from the air, and without some sunlight the leaves cannot perform their proper functions. The leaves are the tree's food factories, and the power that runs these factories is the energy from the sun. The intelligence that controls the work is the living protoplasm within the green cell. Sunlight controlled by this protoplasm transforms this mixture of carbon dioxide and water and mineral matters into starch and other plant foods, which is redistributed through the inner bark to all parts of the plant where needed. In the fall much of the food is stored and from it the tree derives its energy to put out its blossoms and first leaves and more than likely contributes very materially to the first stage of the fruit growth. Thus we see that if a tree should become defoliated about the middle of the summer this defoliation may have a direct bearing on next year's crop.

It is a known fact and has been demonstrated in experiments with peach trees, whose growth habits are very similar to the apricot, that fruit buds which have had a strong healthy development throughout the year will better resist frost after opening and are much more liable to cling to the tree under adverse climatic conditions. There is a wide field for our university and experiment stations to determine how far we can influence production in unfavorable seasons by building up and conditioning the tree. In the past our pruning methods have been entirely too severe and wasteful of the tree's energy. We must try to conserve that energy and turn it into fruit bearing. We must find some method suitable to different orchards in different localities to hold the tree within reasonable limits and not sacrifice so much wood growth.

A system of checking and controlling new wood growth in one orchard may not necessarily apply to another orchard near by, because of differences in soil and moisture and location. Unless headed back severely old trees do not sucker so badly as younger ones. The safest practice is for the grower to take a row, or a few trees in a block, and try to work out a system peculiarly applicable to his own need. On these trees practice taking off the suckers which are growing down, and on the points of the limbs jerk out all vigorous shoots except one or two which are to be left to continue in the direction of the limb. Remove the suckers in the center of the tree which are liable to crowd fruit wood, but if there is no fruit wood nip off the point of the sucker and it will harden and then throw out branches. Later on in the summer this practice may be repeated and the new wood which was left to extend old branches may be tipped or shortened in to stop their long growth. If this practice is worked out to fit the needs of each individual grower there will be little work to be done in winter pruning.

KISSEL TRUCKS
In the Citrus Grower's Service

At Riverside, California, this two ton Kissel truck is doing all the road hauling for the Criterion Groves, with 210 acres in oranges.

During the height of the picking season, it has moved, with the use of a trailer, as high as 1500 boxes to the packing house in a single day.

Complete dependability and great reserve power. These two factors make the Kissel especially valuable for the rancher's service.

There are many other reasons why some of the biggest ranchers in California are choosing Kissel trucks for their hauling. Let us tell you some of them.

Anti-Alien Ownership

TULARE County has felt the need of protecting Tulare County lands and keeping them for American owners. The sales being made to aliens under the pretext of "guardianship" were regarded as violation of California state law. Hence the matter was carried before the courts in a case tried by Judges Wallace and Allen. From judgment rendered and signed by both judges the following review and quotations are made:

"On December 6, 1919, an order was entered in this court requiring Joe Nishida, guardian of said minors, to show cause why his letters of guardianship should not be revoked for his failure and neglect to file an inventory of his wards' estate. In response to this order he appeared in court January 5 and a hearing was had."

The opinion then recites that in the petition of Nishida, to be appointed guardian of the estates of said minors, it is averred that the minors have an estate of 30 acres valued at $8,000; that guardianship papers were issued to Nishida; that Nishida failed to file inventory of estates of his wards and continues: "He reports his possession as guardian of 30 acres of land purchased on behalf of said minors by Marangu Watanabe, the father of one, and Yasue Hiruma the mother of the other on April 28, 1917, under an executory contract.

"It provides that the party of the first part agrees to sell to parties of the second part and the parties of the second part agree to buy in the name of and for the use of said minors in joint tenancy and the survivors of them, the said real property for the sum of $82,000. The contract contains this provision: upon full payment being made, a grant deed shall be executed and delivered to said minors."

The opinion further recites that a total of $8,188.87 has been paid by Nishida on the contract for this land. He has procured no order of the court authorizing him to sell or to purchase or to mortgage or to procure a loan or advance from the Associated Raisin Company. Figures produced in court show that he has received loans on crops of $1,280.

The opinion further recites that contract for the purchase of the real property is very peculiar. It provides that these infants under the age of two years shall have immediate possession of the realty. The parents agree to buy said real property and to pay for it and to pay all taxes and assessments on it. They also agree at all times during the life of the contract to take good and farmer-like care of said property and the vines growing thereon. Notwithstanding this covenant the guardian of his own volition has taken charge of the property, proceeded to develop it and farm it for said minors and made several contracts without any authority from the court.

"It seems to me that this contract was entered into to evade the alien land law which forbids aliens ineligible to citizenship to acquire, possess, enjoy, transmit and inherit real property or any interest therein in this state.

"The manner in which the property has been handled tends to confirm the view that the real purpose of the contract was to effect an evasion of the alien land law. Although it appears that upon final payment the title shall go to the minors, still the parents under their agreement that at all times during the life of the contract they must take good and farmer-like care of said property and the vines growing thereon, gives them the right to occupy it for that purpose even to the exclusion of the guardian. So far as the contract requires any affirmative action on the part of the minors as taking and holding possession of said property on their giving consent to improve the property beyond what is necessary to keep it in good condition or to permit any of the income to be used in payment of the purchase price, the agreement is void under section 33 of the civil code, nor could they prior to the age of eighteen years accept the provisions of a contract made for their benefit relating to real property or any interest therein.

"Section 1773 of the civil code provides that every guardian must return to the court a verified inventory of the estate of his ward within three months after his appointment. He must annually thereafter and at such other times as directed by the court, render a verified account of the estate of his ward. He has done neither of these acts. In addition to these delinquencies he has entered into contracts regarding the property of his wards, made extensive purchases of personal property, borrowed money on the crop produced, invested large sums in planting the property to grapes without having procured any order of court and has also without authority of law used part of the money arising from the sale of the crops to make payments on the purchase price of the real estate. In the contract of purchase, the parties of the second part, Masagi Watanabe and Yasue Hiruma, agree to purchase the land and to pay the whole purchase price therefor. There is no provision in the agreement that any part of the purchase price shall be paid from moneys derived from any sales of any crops produced upon the premises.

"It does not appear that said guardian has offered any legitimate excuse for his failure to comply with the provisions of the law in these many matters and especially for his failure to file an inventory as required and an order will be entered that his letters of guardianship be revoked and that he be removed from the office of guardian of the estates of said minors. An application for the appointment of some other person as guardian in his stead will be considered by the court if reasonably made."

CANE BERRIES

All berry plants should be in the ground now or in the very near future, so that we are not so much concerned with what or how to plant as with subsequent treatment. It may be as well to remark in passing, however, that thornless berries will probably supplant the older thorny varieties and it is up to some plant breeder to remove the thorns from the better sorts, as the Crandall blackberry and the Cuthbert raspberry. The call has been strong this season for Corey's Thornless, said to be really a thornless Mammoth. The claim is made that pickers will not clean thorny vines as they will the thornless and thus many of the finest berries on the former are lost to the grower.

In Central and Northern California many plantations are not irrigated at all, especially those planted on lowlands. The soil is plowed deeply and thoroughly worked and fertilized before planting and no water is given. During summer cultivation is kept up and hoeing is done to kill the weeds in the rows. In the south irrigation is sometimes frequent and heavy. To show the range in practice, a large shipper at Sebastopol, Sonoma County, with sandy loam soil, moist cool summers and a daily coastal breeze, does not irrigate at all. At San Gabriel, Los Angeles County, on higher ground, with heavy soil, an experienced grower will irrigate every three weeks the first season, to induce heavy cane production, and on older plantings once a month. In fruiting season a weekly irrigation is sometimes practiced.

Supports and Pruning

The runners or trailers like Logan, Mammoth, Himalaya, Corey and Black Cap are trellised. The simplest trellis, in use by one of the most extensive growers, is two wires on posts ten or 12 feet apart and at two and three feet, respectively, above the ground Others place five foot posts with two wires at three and four feet, with a T cross piece to carry four wires. The latter is the most elaborate we have seen on an acreage scale. One commercial grower stretches a single wire for Loganberries, about 18 inches above the ground; still another prunes rather short and ties tips to stakes and these latter were the heaviest croppers to be found.

Raspberries of the Cuthbert type are cut back in autumn to three feet and generally given some support to prevent winds from blowing them over. A single wire a foot above the ground will prove sufficient. Black Cap raspberries of the Cumberland type are favorites with some and with these all old canes should be removed as soon as fruiting season is over. The

younger canes sometimes produce a fall crop and bear next season. Tip pinching is closely practiced by some growers for Black Caps run out too long and produce little fruit. This treatment will prove sufficient pruning, some beginning the pinching on the new growth down near the ground, to make plants bushy. With Loganberries two methods are followed and both bring success. One is to prune to six feet in January. Another is to cut to same length just after fruiting, allow the laterals to grow as they will and cut to one foot in January. This gives a heavy producing plant. With the Mammoth and the more rampant class of vines, cut away all the weaker canes and allow five or six strong ones to remain at ten feet, tying these securely to the trellis. This work may be done at any time from November to February.—E. B.

GUARD AGAINST SUNBURN

Protection of the young orchard against sunburn is often put off until too late. Young trees should be protected by whitewashing or other means, as soon as they are planted. Older trees should be protected as early in the season as possible. A coat of whitewash is one of the best methods of protection if applied early.

Formula for Whitewash

Quicklime (unslaked lime), 5 pounds; salt, ½ pound; sulphur, ½ pound; water, about 5 gallons.

Slake the lime with hot water, adding the salt and sulphur while it is slaking. When the lime is thoroughly slaked, add water to make about five gallons of whitewash. As lime varies in quality more or less, it is not possible to state the exact amount of water to use, but growers who have used the above proportions have had good results. Try this out first in a small way, and if the proportions seem about right use it on both young and old trees to prevent sunburn. Most bad luck in the use of whitewash comes from making the wash too thick. It should flow freely when used and not be white until after it dries.

Evil Results of Sunburn

Injury from sunburn causes a gumming on the affected part which affords a desirable place for a small beetle to deposit eggs. The larvae, or grubs, which hatch from these eggs are the flatheaded apple tree borer, or sun-borers, and cause the death of many trees.

MORE SEED POTATOES NEEDED

There is a large and persistent demand for good seed potatoes, but practically no supply at this time. The stock to be obtained, to say the best about it, is indifferent and much of it is even unfit for use. Complaints are numerous and rejections of shipments common. In a season of shortage of seed potatoes like the present almost anything will be shipped by many dealers to fill their orders. Nearly all of the California certified seed potato stock was sold before it was harvested. Only the highest praise has been received for this inspected seed and California should produce a much larger supply. It should not be necessary for California to import every year large quantities of seed potatoes, as the greater part of this imported stock is of inferior quality. Everyone growing potatoes for seed purposes, even if only for his own use, should have his fields inspected, as a number of diseases may be present which are seriously injuring his crop without his knowledge. Information regarding the inspection work will be gladly furnished by the state department of agriculture at Sacramento.

KEEPIN FIT

The United States Public Health Service, 228 First St., N. W., Washington, D. C., offers to distribute free its pamphlet, "Keeping Fit," which has to do with the proper care of one's body, athletics and muscular development. All it costs subscribers of the Cultivator is a postcard with name and address written plainly.

OF COURSE

"What makes the new baby at your house cry so much, Tommy?"

"It don't cry so very much," was the indignant reply of Tommy, "and anyway, if all your teeth were out, and your hair off, and your legs so weak you couldn't stand on them, I guess you'd feel like crying too."

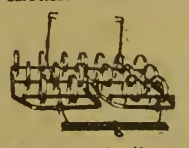
Roderick Lean

For A Perfect Job of Discing

WHEN your discing is finished, what will the verdict be? Can you say--"well sir, there's a real job of discing"--or must you look at work half done?

AUTOMATIC ENGINE DISC
Built in 8, 9 and 10 ft. sizes. An automatic, leverless double disc specially built for tractor use only. Gangs are automatically angled by draft of the tractor without stopping or dismounting.

"NEW CENTURY" ENGINE DISC
Furnished in 5, 6, 7 and 8 ft. sizes for use with lighter tractors. Built extra strong for power use. Operated from tractor seat by two levers within convenient reach. Adjustable hitch suits any standard light tractor.



Spring Tooth Harrow
Has heavy, one-piece angle steel frame with extra runner plates to prevent wear, long spring teeth of special steel, and special adjustable tooth fastening device. Good clearance and light draft.

Steel Lever Spike Harrow
The first steel spike tooth harrow ever built, and the best known and most widely imitated. Every ounce of special steel. Every section surrounded by strong channel steel frame, braced at two corners and center. Cannot twist.

The Roderick Lean New Century Single Disc Harrow gets down deep and does the work right. It pulls easily at an even depth, slicing and pulverizing each clod, stirring and mixing each foot of ground ***for a perfect job of discing.***

This famous farm tool is backed by twenty years' experience in disc harrow building. Built for light draft, yet strong enough for the toughest discing. Notice the special center pressure adjustment operated by foot lever as pictured above. This makes easy the cutting out of dead furrows, ditches and working over hard, uneven ground.

Built in all sizes from 4 to 10 feet, with 16 or 18 inch round discs.

Your dealer will show you this disc. See him, or write direct for complete information.

SAVE THE FERTILITY

The value of green manure for improving fertility is explained in a recent interview with S. P. Clark, extension agronomist of Arizona agricultural college, who is conducting field work with farmers of that state. Mr. Clark states that systematic crop rotation and diversified farming are absolutely necessary to permanent cotton production in any region, however fertile the soil may have been in the beginning. The South with its cheap negro labor was able to produce cotton year after year at an apparent profit, but the soil became in many places almost completely exhausted. The crisis for them came with the boll weevil and they were then forced to adopt a rotation system. Now these same farmers are producing greater incomes than before the boll weevil came.

In producing 500 pounds of short staple lint cotton, the plant removes from the soil the following elements: Lint, 1.70 pounds nitrogen, 0.50 pounds phosphorus, 2.30 pounds potash; seeds and stems, 34.10 pounds nitrogen, 13.85 pounds phosphorus, 12.75 pounds potash; leaves and bolls, 63.95 pounds nitrogen, 24.35 pounds phosphorus, 44.95 pounds potash.

For long staple cotton in Arizona the stems and leaves would undoubtedly yield a higher amount of these fertilizing elements.

From this table it will be noted that practically two-thirds of the plant food elements removed from the soil by the plant are in the leaves, stems and bolls or in the part of the plant that has very little commercial value. It is the practice with a great many cotton farmers to rake up and burn the cotton stalks in order to get them out of the way. It is true that a field cleared of all trash can be worked much easier. But very few farmers realize the value they are losing in plant food elements where they burn cotton stalks. In order to maintain fertility the more organic matter in the form of cotton stalks, straw, spoiled hay and barnyard manure that can be returned to the soil the better.

If plant growth is burned organic matter will have to be supplied by crop rotation in which some legume plant is included and used for green manure. It is necessary to plow under the entire legume plant in order to increase the fertility of the soil. A legume plant secures from the air approximately two-thirds of its nitrogen and one-third from the soil. This proportion will vary somewhat, depending upon the soil.

Where a soil is very rich in organic matter and nitrogen, a legume will secure almost its entire supply of nitrogen from the soil. Where a soil is very poor in nitrogen, the legume will enrich the soil in this respect.

The harvested crop of hay retains about two-thirds of the nitrogen content of the plant, and one-third is retained in the roots. When the crop is harvested and sold off the ranch, the soil gains very little in fertility except from the stems, leaves and stubble that may be left on the field.

One hundred eighty thousand eucalyptus trees are to be set out within the next 30 days near Ontario, San Bernardino County, to counteract the damage occasioned in wind swept areas. The trees have been grown by tbe Chaffey Union high school and the American Beet Sugar Company at a total cost of some $3,600, and are contributed gratis to the farmers in the windswept district who wish to cooperate with the farm bureau in caring for the trees that might be planted adjacent to their property.

A bill has been introduced in the New York legislature to abolish the state farms and markets council, the offices of commissioner of agriculture and of commissioner of foods and markets, and substitute a commissioner of agriculture and markets, to be appointed by the governor at $15,000 a year.

The farmers of Junction City, Oregon, and locality are planning to establish a cooperative warehouse similar to the one that has been operated successfully for the past two or three years by the Grangers Eugene Warehouse Association. It is planned to raise $20,000 for the project.

Pays For His Land With One Crop of Cotton!

Thomas L. Jones, of Calipatria, Northern Imperial Valley, bought 60 acres from this association for $7300. His returns from one crop of cotton were $8550. Net profit, after paying for the land, $1250.

It is not at all unusual for newcomers to pay for Imperial Valley farms the first year, and then continue to make enormous profits, or rent their land for $20 to $50 per acre cash. You can do as well on the marvelously-productive silt lands, with never-failing irrigation water, now offered for only

$90 to $175 per Acre

(On Easy Terms)

This is positively the last big tract of Imperial Valley lands to be subdivided. You must act quickly to share in this great opportunity. Investors realize that THIS IS THE BEST VALUE IN FARM LANDS TO BE HAD IN AMERICA TODAY, and that these lands soon will double—even quadruple—in value.

Enormous Profits From Every Crop

Our lands, including the practically-frostless belt near Niland, are unequalled for Pima cotton, grapefruit, winter vegetables, grapes, cantaloupes, grain, alfalfa, dairying, hog-raising, turkeys, chickens.

Thousands of farmers, who make their homes in the valley, the year 'round, are GROWING RICH. Investigate at once. Fortune positively awaits you in the NILAND-CALIPATRIA DISTRICT, NORTHERN IMPERIAL VALLEY. Ask us to prove it. Send for literature and complete information.

Imperial Valley Farm Lands Association, Owners

Thank You

This is the first advertisement we have written this season, and it is only to express appreciation to California planters for calling on us for more than a million fruit trees without solicitation nor advertising.

We value very greatly the confidence extended to us and only regret that we could not serve all who offered us their accounts.

California Nurserymen are taking a great progressive step in the newly formed Nurseryman's Bud Selection Association of California. This association has for its aim the elimination of inferior varieties and strains of all commercial deciduous fruits, and the breeding up by selection of California's most profitable varieties. A thoroughly efficient corps of pomologists will begin this important work this season, so that the buds used this coming summer will be selected only from parent trees showing superior bearing propensities. After several year's work we will be able to establish "pedigrees" for California fruits quite as clearly as is done in purebred livestock.

Prof., L. B. Scott pomologist of U. S. Dept. of Agriculture has been released from his work at Washington to undertake the general management of this new work in California.

Nearly ninty per cent. of the deciduous nursery stock grown in California is now represented in the membership of The Nurseryman's Bud Selection Association. The few nurserymen who have not joined should do so for the good of the future of California Horticulture and Viticulture.

We have the unqualified endorsement of all interests concerned in the future of the fruit industry of the country. Nurserymen who have not yet joined this movement should communicate with Max Crow, Gilroy, Calif., Secretary-Treasurer; or J. E. Bergtholdt, Newcastle, Calif., Acting President.

Fruit growers of this banner fruit district of the world deserve the best that can be produced in nursery stock, and the Nurserymen of California are going to give it to them.

CULTIVATOR PUBLISHES IT

The "California Cultivator" of Los Angeles carries in a recent lssue the advertisement of "Hebe" with its specious, misleading argument ln favor of that misbegotten "milk" product of the Carnation people of Washlngton.

We are surprised that the "California Cultivator" has touched this advertisement.

"Hebe" is not milk. It is a menace to the legitimate milk industry.

The dairy industry of California will not recognlze "Hebe" as a milk product. The dairy industry will fight it at every turn.

The "Californla Cultivator" expects some of its circulation and some of its advertising to come from dairy people. The "California Cultivator" must know it if it reads its own advertising that "Hebe" is an emulsified mixture of skim milk and cocoanut fat. The "Callfornia Cultivator" must know that the dairy industry will not quietly stand by and see such a hybrid product introduced and sold. The dairy industry is against "oleo" and it places "Hebe" in the same class.

On the page opposite to the one on which "Hebe" is extolled in the "Cultivator" there is a big advertisement from Swift & Co., in which the packers are extolled by Robert J. Kleburg of Texas. The matter is respectfully referred to the California Cattlemen's Association.

Farm papers are supposed to cater to farmers; to defend the interests of farmers; to help try to get a square deal for farmers.

It is no part of the function of farm papers to help spread packer polson and to enlarge on the glories of milk substltutes.

* * *

The Californla Cultlvator feels that no apology need be offered the dalry interests of Callfornia for any pollcy it has followed in the past. This paper has persistently and consistently malntained a friendly attltude toward every movement that it felt would in any way advance the interests and welfare of those engaged in the dairy business, and we can assure our readers that such a policy will be carefully maintalned in the future according as we see the light.

In regard to the matter referred to above we beg leave to say that when the schedule for the advertlsing in question was offered, the writer addressed a letter to Mr. Henderson, president of the Associated Dalrymen of California, inquiring if he knew of any objection to the acceptance of the schedule, provided the copy was honest in fact. The reply from Mr. Henderson follows:

California Cultivator,
210 Ochsner Building,
Sacramento, California.
Gentlemen:

In reply to your letter of December 22, will say that the legislation concerning the Hebe question prohibited all manufacturers of "Hebe" from selling their product in this state unless it was stamped and marked, designating just what it was. As I understood it, the law requires them to advertise it as a substitute for milk. It is my opinion that the dairy interests would not object to your paper taking their ad, provided the advertising copy was honest in fact and made no claims that the product was the equal of milk, but that it was a substitute for milk, and suitable for cooking purposes. If the advertisement set out those facts, I can see no reason why the dairy interests should object to the advertlsing.

Yours very truly,
J. M. Henderson, Jr.

It was felt, by the writer, that Mr. Henderson, being the president of the Associated Dairymen, was in a position to judge accurately the sentiment of the interests he represented. Accordingly the schedule was accepted.

The first indication that came to our attention that the editor of "Dairy and Stock Ranch" had donned his war paint and was on the trall of a paper that carried the copy in question came when he pald his respects to the "Holstein-Friesian World," the leading exponent of that breed. We were struck at the time by the unfair manner in which said respects were pald. Only portions of the copy were quoted which left much to be inferred and imagined. A contemprary was next lambasted, and then our turn came, along with the Holstein-Friesian Regis-ter, which is published by the secretary of the Holstein-Friesian Association.

Now let us examine the facts ln the case: The editor of Dalry and Stock Ranch, standing us in the corner, says: "Hebe is not milk. * * * The California Cultivator must know if it reads its own advertising that Hebe ls an emulsified mixture of skim mllk and cocoanut fat." In this connection, we may say that the very fact that the copy dlstinctly says the product is "labeled with the utmost frankness as to its contents and uses. It is advertised as lt is labeled—honestly and frankly—'A Compound of Evaporated Skimmed Milk and Vegetable Fat,' for cooking and baking." and further: "In the production of every 100 pounds of Hebe 210 pounds of skimmed mllk are used, and 7.8 pounds of cocoanut fat" absolves this paper from any charge that we seek to assist in foistlng across a spurious product. All that we can do is insist that advertisIng that appears in our columns is honest. If such advertising is honest we can not govern the questlon as to whether or not our readers will or wlll not buy. This question of honesty ln advertlsing naturally brings to mlnd the fact that in the February 20 number of "Dairy

Lee Union-Alls

that's the name that signifies the best-made, most popular work garment in America. Farmers who have tested it's comfort and wearing quality will use nothing else. But be sure you get a genuine LEE UNION-ALL. Look for the full name engraved on the buttons and remember it can't be a UNION-ALL if it isn't a LEE.

Stock the Farm with Purebred Holstein Cattle

In spite of the increasing cost of feed, dairying offers you a better opening today than it ever has in the past.

The scales and the Babcock test have systematized the industry until it is no more uncertain than any other business. Even city business men are awakening to its opportunities. Every year it becomes clearer that with large-yield cows, the cost of milk and butter production can be brought down to a point that makes dairying profitable. Have you ever figured out what your farm would be worth to you, if stocked with pure bred Holsteins?

and Stock Ranch" appeared an advertisement with the bold headlines:

"BETTER THAN MILK"

The product advertised was a calf feed, and we wish to submit that there is no preparation for feeding calves that is "better than milk!"

We hold no brief for any product advertised in this paper. We care nothing about the product in question. It may or may not be good. But as long as the advertisement is honest, fair-minded dairymen will not object. We take it that possible competition with dairy produce forms the basis for the extreme feeling expressed by "Dairy and Stock Ranch." If that is the case, and inasmuch as the manufacturers of the product is based on a supply of milk, all that is necessary for the dairymen to do to shut off competition from such a product is to refuse to sell their whole or skim to the manufacturers.

Dairymen must realize by now, if the editor of Dairy and Stock Ranch does not, that they need fear no competition from any manufactured product. The buying public will continue to express preference for the genuine. Dairy interests should furthermore adopt a broader view than many of the leaders entertain. The big problem that confronts the dairy interests of today is not to wage a continued warfare for increased prices for their products, but rather to maintain maximum production through improved methods of dairy management. There are not enough dairy products to go round now. Dairying is not increasing as it should and it will not increase until the industry is made more profitable. But profits will not be reached through increased prices (the consuming public is in no mood to stand for added living costs), but added profits will come through cheapening the cost of production, through the use of well bred bulls, better methods of feeding, and better distribution, such as is afforded by the dairy associations.

The position taken by "Dairy and Stock Ranch" is just as untenable as though the pork producers objected to the use of butter fat for cooking in place of pure leaf lard, or if the beef producers declared war on all papers carrying the advertisement of the National Dairy Council in which the comparative food values of a quart of milk or pound of cheese to a pound of tenderloin steak is made to the detriment of the meat.

As regards the fling taken at this paper because of an advertisement of Swift & Co., and his respectful reference of the fact to the California Cattleman's Association, the innuendo of the editor of "Dairy and Stock Ranch" is uncalled for. Practically every leading farm, livestock and dairy paper in the United States, including "Hoard's Dairyman," from which Editor Scott quoted at length in his outburst against the Cultivator, has carried the Swift advertising.

The Cultivator has only the friendliest feelings toward the dairymen of California and toward "Dairy and Stock Ranch," but we do object to the unfair methods of the editor of that paper.

CATTLEMEN'S DATES CHANGED

Owing to influenza restrictions on public meetings it has been necessary to rearrange the schedule of meetings in the membership campaign of the California Cattlemen's Association. The new schedule is as follows:

March 13, Merced County Cattlemen's Association at Merced.

March 13, Hat Creek Association at Hat Creek, Shasta County.

March 13, Madera County Cattlemen's Association at Oakhurst.

March 20, Tahoe Livestock Association at Nevada City.

March 20, Santa Barbara County Association at Santa Ynez.

March 27, Ventura County Association at Ventura.

April 15, 16, 17, Semi-annual convention at Los Angeles.

April 24, Alameda County Association at Livermore.

May 1, Coarsegold.

CATTLEMEN TO MEET

The semi-annual convention of the California Cattlemen's Association will open in Los Angeles on April 15. A big barbecue has been arranged by the cattlemen for April 17 as the closing event of the convention. Plans are under way to have sales of pure bred cattle in conjunction with the convention.

"FEEDFINE" FEEDS

are scientifically compounded in proper proportions for dairy and all livestock feeding, of the following ingredients with the most economical results always in view.

YEAST — A concentrate high in PROTEIN and FAT content, sterilized and predigested.

CANE MOLASSES — The richest of feeds in carbohydrates—produces increased appetite on account of its palatableness. Its consumption results in increased energy and it is the best tonic known for animals.

ALFALFA MEAL — Gives body to the ration and supplies the mineral matter which is absolutely essential to all animals.

The greatest known combination for health, strength and productiveness.

The Consumption of Beef

At the recent Western Royal Livestock Show at Spokane, Washington, Frank D. Tomson of the American Shorthorn Breeders Association urged the necessity of a campaign in the interests of beef. Mr. Tomson called attention to the activity of the dairy interests in exploiting the products of the dairy. He congratulated the dairy interests upon their enterprise in appealing to the tastes and the economy of the consumers in the interests of dairy products. Mr. Tomson said:

"The Wool Growers Association recently began an 'Eat More Lamb' campaign with very remarkable results. The literature which this association has produced is of a very high and instructive order and of very great value in every household. The results have exceeded the expectations of the sheep producers. In one instance the consumption of lamb, following an active campaign in the Duluth, Minnesota, district, resulted in an increase of lamb consumption from 300 to 1,600 per cent per week. This very fact should cause a careful study, on the part of the beef people, of the possibilities of increasing beef consumption, by wise and energetic campaigning.

"There is menace in the display advertisements of quack doctors and patent medicine dispensers advising against the eating of meat. These scareheads often read: 'Stop Eating Meat,' 'Cut Out the Meat,' 'Meat is Ruining Your Kidneys,' etc., etc. Let beef producers not deceive themselves. These appeals have diverted many millions of dollars from beef consumption but they have not contributed, in the least, to the better health and vigor of those who have been weaned away from the eating of beef.

"What we need is a real campaign of education, employing the assistance of skilled culinary artists that will gain the confidence of the housewives and replace on the menus of tables in this country more frequently the delicate and healthful morsels of beef.

"How often have we observed in the various publications, where a column is conducted in the interests of table economy that numerous substitutes are offered for beef by some so-called expert and this has been so effective that in many towns the attention has been so centered on other food commodities and the so-called cheaper cuts of beef that occasionally round steak, porterhouse and sirloin have sold at the same price, over the same counter. The emphasis has been placed on the high cost of porterhouse and sirloin and forced the call for the round and other cheap cuts with the result as stated, that porterhouse and sirloin have been frequently overlooked, it being assumed that they were out of reach as far as expense was concerned. This merely illustrates that by an intense and persistent campaign, or 'propaganda' if you please, the buying public can be diverted from its choice, although its choice does not involve the greatest expense.

"No doubt such an effort would be welcomed by the consumers and the beef producers would earn the lasting gratitude of the consumers. If such a campaign is undertaken and conducted wisely, we would have no need of looking elsewhere for a market for beef products."

Mr. Tomson said that he had no doubt that the packing interests were agreeable to bearing a generous share of the expense involved and that he believed, further, that the various beef cattle associations would stand an equitable amount. The ease with which a campaign of this sort could be put on renders a longer delay unnecessary and unwarranted.

A resolution was unanimously adopted by the convention, endorsing this suggestion.

NEW MEMBER OF CULTIVATOR STAFF

It is with a great deal of satisfaction that the announcement is made that J. P. Bennett is now a member of the Cultivator's staff. Mr. Bennett is not unknown to a number of livestock breeders of this state. At the 1919 state fair he represented one of the national breed associations. Bennett is a thorough livestock man. He was born and raised on a good Missouri stock farm and his practical experience has been supplemented by courses in the college of agriculture of the University of Missouri. During the past eight or nine years he has been actively engaged in the pure bred hog and cattle business and with his brother has been among the more successful exhibitors at many of the Eastern shows. Bennett has served on the board of directors of two record associations and has officiated as judge at the following shows of importance: Oklahoma state fair, 1916; Nebraska, Kansas and Montana state fairs, 1917; Kansas state fair, Tri-State fair, Memphis, and the International Livestock Exposition, Chicago, 1918. For the past year Mr. Bennett has been engaged in livestock newspaper work in Missouri. He therefore brings to this paper a rich fund of experience and backed by definite accomplishments.

Mr. Bennett will take over the livestock field work and his services are at the disposal of any of our readers.

Bruce S. Bennett (the two Bennetts are not related) resigns about April 1 to take up field work for the Western Berkshire Congress.

The headquarters of J. P. Bennett will be 210 Ochsner Building, Sacramento.

NOTHING NEW

Preserving feed by means of a silo is not new.

Since the days ensilage was stored in a hole in the ground, many types of silos have been used.

All of them have been more or less successful; all of them have had their particular advantages and disadvantages. By carefully noting and correcting these faults without sacrificing the advantages, the Santa Fe Lumber Company, has produced the "Simplex" Silo.

OLD ROMAN PIT SILO

The staves of the "Simplex" are run from Clear Oregon Pine (Douglas Fir) IN ONE PIECE LENGTHS THE HEIGHT OF THE SILO. They do not require splicing, and with heavy tongues and deep grooves, absolutely prevent leakage. The one length staves are a distinctive "Simplex" feature.

The Crissell Tangent Top keeps the "Simplex" in a true circle. It is the only self-adjusting silo brace that has proved its worth by actual performance. It requires no adjustment after the silo has been erected, no matter how much it may be necessary to lossen or tighten the hoops. The Crissell Tangent Top is obtained only on "Simplex" Silos.

It is no longer necessary to point out the necessity of a silo to the man who has stock to feed. The question with him is the kind of silo to buy. The "Simplex" Silo is the result of many years of experience and investigation regarding the needs of the California rancher. Its features were particularly designed to meet those needs. Naturally the "Simplex" Silos must be right.

Your request for more detailed information will receive prompt reply. Mail us the coupon now.

The Doctrine of "Any Old Time"

is a dangerous principle to follow particularly in regard to silage. Corn intended for ensilage should be "put away" when it is in the glaze.

The following table shows why:

Yield per acre	Tasseled July 30	Silked Aug. 9	Milk Aug. 21	Glazed Sept. 7	Ripe Sept. 23
Gross weight	18,045	25,745	32,600	32,295	28,460
Water in crop	16,426	22,666	27,987	25,093	20,542
Dry matter	2,619	3,078	4,643	7,202	7,918
Ash	139.9	201.3	232.2	302.5	364.2
Crude protein	239.8	436.8	478.7	643.9	677.8
Fiber	514.2	872.9	1,262	2,755.9	1,734
N. F. E.	653.9	1,399.3	2,441.3	3,239.8	4,827.6
Crude fat	72.2	167.8	228.9	260	314.3

With a Papec Ensilage Cutter you can make your own silage when the corn is just right, and later refill your silo as the silage settles utilizing what would otherwise be wasted space.

The Papec requires less power to elevate the silage—as a one piece solid semi-steel frame—six fans on the cutting wheel instead of three or four—operates as low as 4 H. P. gasoline engine.

Owning your own silo is not an expensive matter. In fact there is no piece of farm machinery yielding bigger returns on the investment than a Papec Ensilage Cutter.

With Silage at $15.00 a ton you can put a Papec on your farm and it will pay for itself.

Cattlemen's Association Notes

Reports from various sections of Northern California to the California Cattlemen's Association indicate that many districts are still suffering greatly from the drouth. The recent rains have been too slight in those districts to relieve the situation. The Sacramento Valley especially requires immediate and heavy rains both for ranges and crops. Strong north winds quickly dried up what little rain fell recently.

The situation for which the association has been preparing is virtually at hand. Cattlemen who up to now merely have been discussing the possible necessity of shipping cattle out of the state are taking definite steps towards that end. Cattlemen who gathered at Davis for the breed sales stated that they would have to ship unless very heavy and continuous rains fell within a few days.

A definite proposal regarding rates has been submitted by the association to the railroads and immediate approval is expected.

The association has suggested to cattlemen that, as far as possible, they ship only steers and endeavor to keep their female stock on such feed as they may have. It is felt that California range cattle are superior in many ways to the cattle of other states and that it would be a great loss if breeding stock left the state permanently.

Further advices received by the association from Texas confirm previous telegrams which said that that state has ample pasture to offer at rates varying from 50 cents to $1 per head per month.

A meeting f cattlemen held at Livermore appointed a committee to make an immediate report on rates, shipping conditions, pasture available, etc. As soon as this committee reports a representative will be sent to make definite contracts for pasturing a large number of cattle. The Livermore producers plan to join in making up carload lots and sharing pasture. David J. Stollery, secretary of the California Cattlemen's Association, speaking of the situation said:

"The entire strength of the California Cattlemen's Association will be placed in support of such movements as that at Livermore. The association, however, will not countenance or support the actions of certain men who are going through the state taking advantage of the drouth situation and buying up cattle at low prices to ship them to Texas under the favorable conditions which the association has created for the benefit of the cattlemen themselves. Cattlemen who can possibly do so are urged, if shipment becomes necessary, to hold to their cattle and make those shipments themselves, combining where necessary to make up train load lots. The association's efforts to relieve the drouth situation should not, and if we can prevent them will not, be used merely for the benefit of men who are willing to take advantage of the cattlemen's needs. We are backing the industry and not a few speculators."

RULES FOR 1920 POLAND CHINA FUTURITIES

Rules governing the Poland China futurity shows for 1920 are now ready for distribution and may be obtained by writing to W. M. McFadden, Secretary, The American Poland China Record Association, 609 Transportation Building, Chicago, Illinois.

The Poland China futurity show, with the $1,020 in cash prizes that it offers at each state fair that is willing to cooperate in putting one on, has become so well known and so popular that but little comment is needed at this time in regard to the show itself.

The 24 state fairs at which the American Poland China Record conducted futurity shows in 1919 covered a spread of territory from Florida on the southwest to Washington in the northwest and from South Carolina to California.

The big money offered and the large number of ribbons for each class, together with the general idea of closing the show to those who fail to nominate early in the spring, has made the futurity show idea very popular, and it is thought that the number of these state futurity shows will be increased this year by the addition of several new ones.

Do not forget that herd nominations should be mailed to the secretary of the American Poland China Record by March 15.

They All Go to the State Farm

A group of Hereford females purchased by Manager Duffy for the Napa State Farm.

To Head a Great Herd

Pacheco Cumberland, the top bull of the Davis sale, sold by Pacheco Cattle Company, Hollister, to A. S. Nichols Company, Sierraville, for $925.

A conference of stockmen will be held today, March 13, at Montague, Siskiyou County, to consider formation of an inter-county organization to market cattle. It is expected that stockmen of Lassen, Siskiyou and Modoc Counties will be joined in this organization by stockmen on the Oregon border.

80-Outstanding Holsteins-80

The Guaranty Sale

State Fair Grounds, Sacramento, Cal.

Thursday, March 25, 1920

Some of the Great Females in Sale

A 35 POUND GRANDDAUGHTER OF KING OF THE PONTIACS, now on yearly test and bred to King Korndyke Pontiac 20th.

A BEAUTIFUL 33 POUND COW that made 30 lbs. as a 4 year old. Will be fresh before sale.

A 33 POUND three quarter sister to Raphaella Johanna Aaggie 3d, the world's record holder for milk in one year under strictly official test. Will be fresh at sale time.

A 33 POUND SECOND CALF, 4 YEAR OLD sister to a 33 pound cow and a 32 pound cow. On yearly test and bred to King Korndyke Pontiac 20th.

A 32 POUND SENIOR 3 YEAR OLD that made over 20,000 lbs. milk and over 750 ibs. butter in one year as a junior 2 year old. Bred to King Korndyke Pontiac 20th.

A 32 POUND COW that has a 30 lb. 4 year old daughter, also in the sale, a 33 lb. 4 year old sister, also in sale, and another 33 lb. sister. Now on yearly test and bred to King Korndyke Pontiac 20th.

A 32 POUND COW that made over 30 lbs. at previous freshening. Now on yearly test and bred to King Korndyke Pontiac 20th.

A 30 POUND daughter of Korndyke Queen De Kol's Prince out of a half sister to Tilly Alcartra. Bred to King Korndyke Pontiac 20th.

A 30 POUND JUNIOR 4 YEAR OLD daughter of a 32 pound cow, bred to Sir Aaggie De Kol Acme 2nd, five of whose seven nearest dams average 1154 lbs. butter in one year.

A 30 POUND daughter of Arcady Pontiac Wayne Hengerveld. Bred to Sir Aaggie De Kol Acme 2nd.

A 30 POUND SENIOR 3 YEAR OLD bred to King Segis Pontiac Jannek.

A 29 POUND great granddaughter of King Segis, still on test and bred to King Segis Pontiac Jannek.

A 28 POUND daughter of King Pontiac Segis Korndyke. Now on strictiy official yearly test and bred to the three times grand champion bull King Segis Alcartra Prilly.

A 28 POUND COW of splendid type, bred to Prince Walker Cornucopia, 36 lb. son of Prince Gelsche Walker.

A 28 POUND granddaughter of Johanna De Colantha Champion, bred to King Korndyke Pontiac.

A 27 POUND COW 4 YEAR OLD with 748 lbs. butter from 17854 lbs. milk in one year as a junior 3 year old. Bred to a 34 lb. grandson of a 1200 lb. 3 year old.

A GREAT 27 POUND COW whose sire is out of a half sister to Tilly Alcartra and whose dam is a half sister to the 37 lb. cow Boweda. Bred to Sir Aaggie De Kol Acme 2nd.

A 27 POUND daughter of Arcady Pontiac Wayne Hengerveld, bred to King Segis Pontiac Jannek.

A 27 POUND granddaughter of Colantha Johanna Lad out of a granddaughter of Sir Skylark Ormsby Hengerveld, bred to the $106,000 bull Carnation King Sylvia.

A LARGE NUMBER OF 25 AND 26 POUND COWS of rich breeding, excellent type, some with yearly records, and bred to outstanding bulls.

A 24 POUND 2 YEAR OLD daughter of Sir Veeman Korndyke Pontiac, bred to King Sadie Vale Idyl Segis, a 35 lb. grandson of King Korndyke Sadie Vale and King of the Pontiacs.

A 23 POUND 2 YEAR OLD daughter of Sir Veeman Korndyke Pontiac, bred to King Sadie Vale Idyl Segis.

A 21 POUND 2 YEAR OLD daughter of King Korndyke Sadie Vale 22nd, bred to a 32 lb. son of King Morco Alcartra.

A WONDERFUL LOT OF 2 YEAR OLDS with records up to 21 lbs. butter in 7 days, most of them now on yearly test and bred to the highest class bulls.

A NUMBER OF RICHLY BRED HEIFERS OF SPLENDID TYPE, now bred to drop their first calves, including daughters of Prince Gelsche Walker, King Mead of Riverside, King Korndyke Pontiac 20th, Sir Veeman Korndyke Pontiac, King Pontiac Netherland Segis 3d, a daughter of a 1000 lb. 4 year old granddaughter of Tilly Alcartra, two daughters of Sir Aaggie De Kol Acme.

You will need to secure a copy of the sale catalog to realize fully the wonderful breeding represented in this sensational offering. Write for a copy today to the sale management.

Holstein history will be made in this sale

The progress and development of the Holstein-Friesian breed has no parallel in Pacific Coast agriculture, and in this offering the contributing breeders have permitted animals to go out of their herds that establish a new mark in quality of public sale offerings in the west.

A golden opportunity for the beginning breeder

Because the breeding of purebred registered Holsteins is founded upon the everlasting foundation of economical production of human food, the business is one worthy of the keenest minds, with positive large financial returns as a reward for good management, and proper investment of capital.
opportunity to sit at one sale ringside and have so many io invest his time and money in registered Holsteins will do well. The demand today is for QUALITY, and the man about tbest foundation breeding animals that is permitted by available to consider that fact. It pays in this age to buy the very
capital and the scope of the breeding plan. for QUALITY. Never before have Pacific Coast buyers had an This offering is essentially one that will meet the demand ndividuals of the Black and White breed of the character of these pass before them for public appraisement. It is an opportunity that holds the very greatest possibilities for the buyer who is determined to own the best.

A brief summary of the animals listed

At the left of this page is a brief list of some of the high class females to be sold. Outside of the eleven 30-35 pound cows, and some of those with records between 27 and 29 pounds butter in 7 days, the list gives no adequate idea of the wonderful lot of young cows in the sale with records from 20 to 25 pounds butter in 7 days, many with good yearly records, nor the really wonderful list of 2 year olds with excellent records and rich backing.
Neither does the list set forth some of the wonderful family groups, such as the 32 pound cow Winifred Hotaling 3d, her 30 pound 4 year old daughter and 33 pound 4 year old sister. Only a detailed list of the entire catalog can reveal the richness of this offering.

Individuality of the offering

A very high degree of approved breed type is characteristic of the animals in this sale. This is only one of the several ways in which this group excels any previous sale herd in the west.

The females are bred to outstanding bulls

Not only are the females to be sold of great desirability and value because of their own high records, their splendid type, and the richness of their breeding, but they are made vastly more promising investment as breeding animals because of the outstanding quality of the bulls to which they are bred. Twenty reference sires appear in the catalog of this sale, and the list embraces a very large percentage of the really top notch sires now in service in the west.

The calves from these matings will be valuable

In many an instance the calves dropped by cows in this sale will be worth more than the dams will sell for, and that statement is made with full realization that the value of many of the cows runs well up into four figures. Practically every one of these calves will be by a herd sire that some good breeder is developing and backing with his best efforts, another fact that may well be taken into consideration by the prospective buyer.

Bulls of good type and rich inheritance

There promise to be some real bull bargains in this sale. An unusual feature of the offering as a whole is the fact that most of the dams have not yet reached mature age and the chances for very substantial increases over present records are good and will put dollars into the pockets of those who are fortunate enough to buy in this sale. The following is a brief outline of the bull offering:

A SHOW BULL with an average of 934 lbs. butter in one year for five of his 7 nearest dams.

A GREAT YOUNGSTER by a son of a 31 lb. 2 year old, out of a 23 lb. junior 2 year old now making a large yearly record, second dam a 31 lb. cow that made over 30 lbs. as a 4 year old and over 800 lbs. in one year, third dam a 30 lb. cow that made 1129 lbs. butter in one year.

A SON OF KING KORNDYE PONTIAC 20TH out of a 32 lb. 3 year old that made over 20000 lbs. milk and over 750 lbs. butter in one year as a junior 2 year old.

A SON OF KING SEGIS ALCARTRA PRILLY, the three times grand champion bull, out of a 33 lb. daughter of a 37 lb. son of King of the Pontiacs. His first 11 dams average 30.54 lbs. butter in 7 days and he is a wonderful individual.

A HIGH CLASS YOUNG BULL by a son of a 36 lb. 3 year old that made over 1200 lbs. butter in one year, out of a 31 lb. 2 year old granddaughter of Aaggie Cornucopia Johanna Lad.

A SON OF KING PONTIAC NETHERLAND SEGIS 3D out of a 28 lb. cow that has a 25 lb. 3 year old daughter and a 17 lb. 2 year old daughter.

A SON OF PRINCE WALKER CORNUCOPIA, out of a yearly record daughter of an 1117 lb. cow. The dam's record will be completed by sale date.

A SON OF KING KORNDYKE PONTIAC 20TH out of a 26 lb. 4 year old daughter of Prince Gelsche Walker and a 29 lb. daughter of Korndyke Queen De Kol's Prince. A white bull of excellent type and out of a dam that is most promising for a very large record.

A SON OF KING ORMSBY CANARY JOHANNA, who is a 34 lb. son of Sir Pietertje Ormsby Mercedes, out of a 19 lb. junior 3 year old whose dam is a 32 lb. granddaughter of Colantha Johanna Lad. An excellent individual of most popular breeding, the first grandson of Sir Pietertje Ormsby Mercedes ever offered at public sale in California.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to 60 day retest by the buyer

March 25

1—A daughter of Lady Hiske Walker, 34 lbs. 4 year old daughter of Prince Gelsche Walker, who is also dam of Sir Aaggie Hiske Walker, the bull calf that sold for $2,400 last March. Bred to Prince Walker Cornucopia.

2—A daughter of a cow that made over 1,100 lbs. butter in one year. She herself has a good 305 day record and is bred to Prince Walker Cornucopia.

3—A splendid daughter of Prince Gelsche Walker, bred to Prince Walker Cornucopia.

4—A son of Prince Walker Cornucopia out of a yearly record dam, record dam and an 1,100 pound cow. A high class individual, well grown and well marked.

This is a choice group of young, well bred Holsteins that we feel will prove entirely satisfactory and profitable to their purchasers.

March 13, Haag & Bernstein, Hanford.

April 3, Kings County Pig Club sale, Hanford.

April 24, W. T. Dice and Harrold Waltz, Hanford.

Shropshire Sheep

April 17, Butte City Ranch, Butte City.

R. C. Sturgeon, Tulare, reports that the senior three year old Holstein heifer Sadie Maid Pontiac Segis has just finished test, making 24.28 pounds butter in seven days. Recent sales include bull to Alvin Oustlund, Tulare.

W. L. Choisser, Riverdale, has recently sold to Chas. Adams, Burrell, two Poland China sow pigs by Vaughn Jones and litter mates to the two sold in the last Fresno sale for $280.

Anchorage Farm, Orland, recently sold the Modoc Land and Livestock Company 50 bred gilts to which have just been added two gilts from their reserve herd and a boar and sow pig from the first litter by the grand champion boar Natomas Baron Duke. Miss Hardy, manager of the farm, states that the choice pigs of the spring litters are priced at $100 each.

It is the plan of the Mills Berkshire Farm, Hamilton City, to reduce their present herd of 125 sows to about 50. A few bred gilts will be sold this spring and a bred sow and gilt sale held some time during the summer. It is their idea to maintain in the future about 50 sows selected for size, type and prolificacy.

Senator Leavitt, Willows, who owns Packer Bend Farm near Butte City, is rapidly rounding up the farm in shape for more extensive livestock operations. He began founding a herd of Berkshire swine about two years ago, securing foundation stock from Butte City Ranch. Early in the year he secured from Anchorage Farm, Orland, Anchorage Leader 30th, by Star Leader, as senior berd boar, and at the last Berkshire Congress sale he secured a promising young boar in Escalon Artful Leader, by Big Leader, a son of Grand Leader 2nd. A number of sows were purchased at the same sale as well as the Muddux sale. A show herd of young animals will probably be seen at the fall shows.

The annual sale of the Butte City Ranch, of Butte City, scheduled for April 17, has been postponed until some time in August. Mr. Guilford reports that business has been very brisk. Among recent sales made were 20 yearling Shropshire rams at a very good price. The herds and flocks are in good condition and everything points to a busy and prosperous season. The show herds will soon be in course of fitting and should be the cause of some little competition at the leading shows during the coming season. Mention of the August sale will be made as soon as Mr. Guilford decides on the date.

The Anita M. Baldwin Santa Anita Rancho is fitting some great stuff for the Guaranty Sale to be held in Sacramento, March 25. The headquarters of the ranch is now near the old Baldwin residence, the offices in the Washington Building, Third and Spring Streets, Los Angeles, having been discontinued. The Holsteins on the ranch are now in charge of Earl Sturgis, but the direct management of the ranch is now in the hands of Mrs. Baldwin.

William Carruthers of Carruthers Farm, Live Oak, is very busy getting his equipment on his new place in shape to handle his good herds. Among the Shorthorns are some outstanding calves and yearlings by Count Glory. Especial mention is due a five months old roan bull that Carruthers considers just about the greatest calf he has ever bred. He and two roan yearling heifers are good enough to cause some rival showman some little trouble at any state fair in the country. The new home is a beautiful location where the facilities are excellent for maintaining the good herds of Shorthorns and Bershires the Carruthers Farm has been noted for.

Harry L. Redd who has been in charge of the W. J. Higdon herd of Holsteins writes that he is to be associated with E. D. Barry, Jr., owner of the Tosantos Holstein herd, Daggett. Redd is regarded as one of the most successful herdsmen in the West and has a long string of splendid records to his credit. Redd handled Ruby Pietertje of Forest Hill 2d, whose senior four year old record of 39.74 pounds butter placed her at the top of the Pacific Coast cows and whose 30 day official record of 162.11 pounds butter from 3,134.9 pounds milk is the third highest in class. The Tosantos herd includes much excellent material and Redd ventures the prediction this herd will be heard from in a very emphatic manner.

W. F. Sandercock, Berkshire breeder of Sacramento, has purchased from a Kansas breeder a sow that is a litter mate to his former herd boar, Baron Duke 201st, grand champion at the 1917 National Swine Show. Sandercock has sent his new purchase to Anchorage Farm, Orland, to be bred to Natomas Baron Duke, grand champion at the 1919 state fair and the San Francisco show, and a son of Baron Duke 201st.

V. F. Dolcini, Davis, reports the sale of a September Duroc boar pig to the Hollow Hill Ranch, Colton. The boar was sired by Great Wonder's Model 3d, a son of Great Wonder.

Three hundred and five head of Shorthorn bulls and females were sold in the third Shorthorn Congress sale for a total of $292,200, an average of $958. The 95 bulls averaged $719 and the 210 females averaged $1,065. The bull Marmion made the top, selling to a South Dakota buyer for $8,000. Gainford Jilt, a daughter of Gainford Champion, topped the female division at $3,500. A feature of the sale was the number taken by South American buyers.

At a recent sale of Hampshire hogs, held in Iowa, 53 head averaged $656. The boar Lookout Longfellow 2d, sold to a Georgia buyer for $5000 and the top sow was sold for $2,800.

The Monroeville Orchards, Monroevlile, which, in addition to their extensive orchards, maintain one of the largest herds of Berkshire swine to be

VERAMONT HEREFORD BULLS

Milks Correctly with Alternating Action

Universal Teat Cup

Universal natural milker

Alternates, Like Milking With Hands

The Universal Natural Milker enables thousands of farmers to add hours to the day for other duties—and to put extra profits into the bank.

Why not you?

Two times a day, every day, Universal is on the job saving time.

Cows like its gentle alternating action and the farmer gets more milk as the direct result. That means MORE PROFITS.

Almost any child can operate the Universal.

Its alternating action milks two teats at a time, while gently massaging the other two as they refill.

The Universal rubber-lined teat cup fits any cow and is easily cleaned and kept sanitary.

At a very small first cost this saving begins.

found in the state, are planning now to have out a complete show herd this fall. In addition to the show animals, especial attention will be given the fat barrow classes including the carload classes. Superintendent Fetzer has these operations in charge.

H. P. Slocum and Son, breeders of Duroc-Jersey swine, are now nicely located on their new ranch a few miles north of Willows. This is a far better location than their previous place as it borders the state highway for nearly a mile, has plenty of shade and about 80 acres of alfalfa. About 40 acres of this is being cut up in small lots on which will be grown the spring litters. Sales have reduced this herd to a minimum with the exception of a number of bred gilts and no doubt these will be moved in the near future. The show herd for this year will be segregated soon and especial care given these animals which include a number of high class prospects in the younger classes.

HOT STUFF FROM THE FARMERS UNION

The Farmers Union located at Sylvan, Stanislaus County, is after a gentleman by the name of Webb with a sharp stick. They say:

"Whereas, the attorney general of the state of California has seen fit to grant his permission to certain citizens of the state to bring suit against the Associated Dairymen of California, Inc., and other dairymen's associations in California for the purpose of dissolving the said dairymen's associations because the said dairymen saw fit to organize for the purpose of protecting their property and securing, by organization, a living profit from their labor and investment; and

"Whereas, this decision vitally affects all farmers and farmers' cooperative associations; and

"Whereas, unless the dairyman and the farmer are enabled to secure a fair and living return for their labors and investment, as are commercial and labor organizations, they will be forced to curtail their production, which means increased prices.

"Now, therefore, be it resolved, that the Sylvan Farmers Union, Local No. 158, at this regular monthly meeting on March 1, 1920, publicly condemns the said action of the attorney general in giving his consent to such a suit.

"Be it further resolved, that it is the opinion of this local that any action which is taken to dissolve the said dairymen's associations will cause a reduction of the milk supply, which necessarily means higher prices and greater hardship on the consumer.

"Be it further resolved, that we, the members of the said Sylvan Farmers Union, Local No. 158, emphatically protest against the proposed action against the dairymen and ask the cooperation of all farmers of the state to get behind the dairymen at this time and help to combat the advances which appear to be being made through the attorney general by the greed of commercial and political interests.—Sylvan Farmers Union, Local No. 158—W. M. Sprowl, president; Mrs. C. E. Whitmore, secretary."

HEAVY CONSUMPTION OF WOOL DURING JANUARY

The present year promises to establish a record for wool consumption if the amount consumed in January is an indication. According to figures released today by the bureau of markets, 72,700,000 pounds of virgin wool, grease equivalent, were consumed by manufacturers in the United States in January, compared with 38,200,000 pounds for the corresponding month in 1919 and 65,100,000 pounds in January, 1918.

The amount consumed was more than the monthly average for either 1918 or 1919 and higher than any month since May, 1918. The largest percentage of wool used was fine, which has a high grease content and is, no doubt, partially responsible for these high figures. At the same time it continues to reflect the public's insistence for fabrics composed of fine wools, the consumption of fine wool being the largest reported for any month since the inauguration of the monthly wool consumption report by the bureau of markets.

The Northwest Milk Dealers Association and the Pacific Northwest Association of Dairy and Milk Inspectors recently met in annual session at Portland. Delegates were present from all the Northwestern states. Both conventions will be held next year at Seattle.

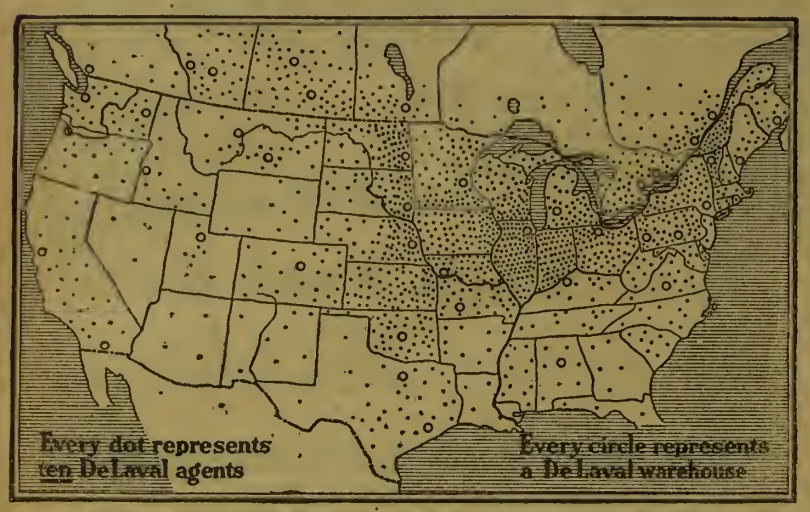
DeLaval Service
Covers the Continent



This map shows how completely the service of the De Laval organization reaches every community

Every separator user realizes the importance of having his separator in use every day. Delays waiting for parts, with a separator out of use, mean great inconvenience and loss of product.

Every dot on the map represents ten De Laval agents, and every De Laval agent is individually trained to assist his customers in setting up and operating their machines, to furnish and put in place repair parts, and to insure prompt service and satisfaction to De Laval users.

Not only is the De Laval Cream Separator superior in all points of separator efficiency, but every user of a De Laval is assured of prompt and competent service for all the years to come.

It is therefore not surprising that there are more De Laval Separators in use than all other makes combined. Now is a good time to begin saving time and product by securing a De Laval.

The nearest De Laval agent will be glad to demonstrate a De Laval. If you do not know his name, write to nearest De Laval office

The De Laval Separator Co.

CENTRAL
Shorthorn Breeders Association
SHOW AND SALE

Kansas City, Missouri

March 30th to April 1st

SHOW on Tuesday, SALE on Wednesday and Thursday

80 BULLS---80 FEMALES

HERD BULLS will be consigned from the best herds in the territory served by this Association. This will be a rare opportunity to secure bulls of the best of breeding, quality and type to be placed at the head of registered herds.

NOTE—The Central Association sales have always offered the leading opportunity of the year to secure bulls in carload lots. This will be no exception.

FEMALES A large number of SCOTCH cows and heifers will be offered—several cows with calves at foot by and rebred to sires that have acquired a broad reputation. Bred and open heifers, also a few calves suitable for calf clubs, will be presented in such numbers that breeders may look forward to securing full carload lots.

Under the Management of W. A. Cochel, American Shorthorn Breeders Association.

Catalogs can be secured of

John A. Forsythe, Sec., Pleasant Hill, Mo.

Auctioneers—Gross, Burgess and Dawson

The Cultivator Costs Only $1.00 Per Year

Be Prompt With Certificates and Transfer

During the last few months there have been a good many complaints from purchasers of pure bred breeding stock that the sellers have been very slow in sending the necessary registration certificates and proper transfers. Generally speaking, most breeders attend to those essential details with commendable promptness but the few who are lax in the matter tend to cast a reflection on the careful sellers that is not justified.

Properly recorded registration certificates constitute the only recognized record that the breeding of an animal is of pure strains and a properly filled out transfer establishes the ownership of the animal. When one buys an animal for breeding purposes he does so because he wants a pure bred animal and knows the increased value attached to such animals. Until he receives the certificate of registry, he has no tangible evidence that he owns a pure bred, and until he receives the signed transfer, he cannot establish ownership and therefore cannot register any offspring.

The prompt furnishing of the necessary "papers" is just as important in the pure bred business as is the deed and abstract to real property.

Usually the delay on the part of the seller is not through any desire to inconvenience the buyer but is due to the lack of system employed by the breeder. Breeders very often put off registering their young things until they are sold. Occasionally the breeder, who is adding to his herd from time to time, overlooks getting the certificates and transfers himself and is not reminded of the oversight until such a time as he may resell his purchase or the produce of his purchase.

All breeders should make it a point to keep their herd records up to date. Care should be taken to gain possession of all papers upon purchase of additional stock. All papers referring to the breeding of the herd or flock should be kept together and accessible. Service dates and births should be recorded. Young stock to be retained or sold for breeding purposes should be registered with as little delay as possible, then when sales are made the purchaser can be handed all papers within a short time after the sale. By following such practice, the breeder can transact his business with greater ease and the buyer, noting such systematic methods, will accord the breeder greater respect and will take pains to speak a good word for the herd—a point well worth considering.

Wouldn't you, Mr. Breeder, rather have it commonly remarked, "When you buy from So and So you can depend on a prompt receipt of certificates and transfers," rather than have former customers advertise the fact "Maybe So and So's stock is all right, but you never can tell when you will get the papers"?—R. P. R.

Kings County Dairy Cow Production Contest

County Agent Wallace Sullivan of Kings County writes that the county farm bureau dairy department cow testing division is testing 900 cows and that all will be enrolled in the production contest. Following are the contest rules:

All owners of herds in this competition must be regular members of the Kings County farm bureau cow testing association, paid up six months in advance.

All records must be kept by the tester employed by the dairy department of the farm bureau and must be kept in herd books furnished by him.

The contest will begin April 1, 1920, and close March 1, 1921. The records will be on ten months' lactation period.

A herd will consist of all cows owned by one man or company that are under test. If for any reason a member desires to drop one or more cows from his testing herd, he may do so subject to the committee.

Under no condition will a cow be dropped that has been tested for six months or more.

At close of contest each herd book will be summarized by the committee in charge and a report of the winners in each class will be rendered to the director of the dairy department who will award the prizes.

Prizes will be awarded:

Herds Contest

Class A, herds ranging 5-20 cows, first, silver cup.

Class B, herds ranging 21-50 cows, first, silver cup.

Class C, herds ranging over 50 cows, first, silver cup.

Class D, groups of five; best five cows in Class A in any one herd, silver medal; best five cows in Class B in any one herd, silver medal; best five cows in Class C in any one herd, silver medal.

Class E, best cow in Class A, silver medal; best cow in Class B, silver medal; best cow in Class C, silver medal.

Class F, grand prizes. Best five cows in any one herd in association, gold medal; second best five cows in any one herd, pennant; third best five cows in any one herd, pennant. Best cow in herd, gold medal; second best cow in any herd, pennant; third best cow in any herd, pennant.

Class G, special prizes: Best record for first calf, heifer, pennant; second best records for first calf, heifer, pennant.

Reasons for Making Dairy Records

The New York state college of agriculture offers the following nine reasons for making dairy records:

1. They enable the dairyman to feed each cow according to the quantity of milk she produces.
2. They form the only basis on which a dairy herd can be improved. The time is here when no dairyman will buy a herd bull whose dam does not have an authentic record, showing creditable milk and butter fat production.
3. Records alone will sell cows when no other quality will. Grade cows with records can be sold for from 25 to 50 per cent more than those without records.
4. A system of records is the first step in building up a herd. The unprofitable cows are the most expensive. Their heifer calves are usually low producers, and should not be raised.
5. Records stimulate better feeding and breeding. The dairyman who feeds a balanced ration, becomes interested in winter dairying, which has numerous advantages over breeding cows to freshen in the spring.
6. The weighing of the feed and milk keeps the owner in close touch with the daily condition of each cow.
7. Records stimulate better milking. Milk scales serve as a check on the milker, and induce him to milk the cows more thoroughly than when the milk is not weighed.
8. A knowledge of what each animal is doing develops personal pride and interest in the herd.
9. Finally, records make dairying a business proposition, and in various incidental ways mean more to the man who milks.

HOW TO CONTROL HOG MANGE

Hog mange is spread mainly by direct bodily contact, according to investigations recently conducted by the United States department of agriculture. The disease is contracted most rapidly among hogs of low vitality, especially those kept in small inclosures. It spreads more slowly among vigorous animals kept in pastures or in clean, well lighted, roomy pens or buildings. Failure by swine owners to control hog mange results in heavy losses from shrinkage as well as from a high death rate. The department states that the disease can be eradicated by four dippings in a lime-sulphur or arsenical solution with intervals of six or seven days between dippings.

Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body — It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Boils, Corns and Bunions. CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

A Perfectly Safe and Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Strains, Lumbago, Sore Lungs, Rheumatism and all Stiff Joints

REMOVES THE SORENESS—STRENGTHENS MUSCLES

Cornhill, Tex.—"One bottle Caustic Balsam did my rheumatism more good than $120.00 paid in doctor's bills." OTTO A. BEYER.

Price $1.75 per bottle. Sold by druggists, or sent by us express prepaid. Write for Booklet K.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Tuberculosis

A friend has a young cow that has three small lumps on the lower jaw, about the size of marbles and movable. She also has a lump in the throat about the size of a hen's egg. She does not cough and is in good condition. Could it come from a manger that is too high where she has to strain to get at the feed?—Subscriber, Ethanac.

This would cause one to suspect tuberculosis. Have her tested at the earliest opportunity. Reaching for the feed would not cause lumps unless on the breast where an animal might lean against a low manger when reaching for the feed.

Ringbone

I have a seven year old mare that has developed what looks to me like ringbone on the hind feet, which I think has come from pulling too heavy loads. She is not what might be called lame but seems to be somewhat stiff in these parts. What can I do to reduce the enlargement and bring the parts to their normal condition?—Subscriber, San Jose.

The ringbones may have been started by overwork as you suggest or from rheumatism. The reason that the lameness is not more marked is because both ankles are affected alike. They can never be brought to their normal condition but can be hardened into solid bone and then the lameness will disappear. The best treatment is to fire and blister the parts, which would require the services of a veterinarian. Probably the next best method would be to use the following liniment: One dram bichloride of mercury, one ounce alcohol and enough turpentine to make one pint. Mix in the order given. Apply enough of the liniment to wet the parts once a day. Do not apply above the ankle nor on the back of the swellings. The skin is too thin there and the liniment would irritate too much. It is good to apply a little vaseline on the back of the ankle to protect the skin. With this treatment you can work the horse at light work. The only cure is to grow the two bones of the ankle together and unless there is considerable lime in the drinking water it would be good to add a tablespoon of phosphate of lime to the feed once a day.

Abscess

We have a heifer about three years old, fresh three months, that has developed a hard swelling about the size of an infant's head on the breast between the front legs. It is smooth and hard with no soft spot nor hole in the skin. She was lame about a month ago and was treated for rheumatism but the lameness has disappeared since the swelling came. She is giving three gallons of milk a day, eats well, chews her cud and seems well but is thin in flesh for the amount of feed she eats. Lanced the swelling today, making half inch incision, but nothing but blood came. It is gradually growing larger. Please advise what it is and what to do for it.—Subscriber, Ethanac.

It is hard to say what caused the abscess but there is only one remedy. Open it, making a large opening and syringe it out once a day with warm water in which you have put enough permanganate of potash to make it cherry red. A large abscess is quite a drain on the system and that is causing her to be thin in flesh. When the abscess is healed she will probably regain her normal flesh.

Our Position

Lendorris Ranch could not have gained and held the enviable position it now holds as a breeder of big type Poland Chinas if the animals bred did not meet the approval of our customers.

True—Lendorris Liberty Bond and Young Jumbo have proven to be superior sires which accounts in part for our present position. Our sows, of course, have been of material assistance. We will be pleased to answer your inquiry.

W. L. Haag and Son Hanford, Cal.
Bred Sow Sale, March 13

There Must be a Reason

for our rapidly increasing business. Our business is breeding the farmer's friend, the big type Poland China hogs.

Golden West King Grand Champion at San Francisco Livestock Show
Blue Valley King by Big Bone Leader

are boars that sire the kind of Poland Chinas that help us increase our business. If we didn't breed the right kind and absolutely satisfy our customers we couldn't increase our business. This is a good reason why you should be one of our customers. Write us.

A. Buckland & Son, R.F.D., Fresno, Cal.

SEQUOIA HERD of Big Type Poland Chinas

Senior Herd Boar—GIANT BOB, grand champion at state fair. Highest priced boar in the West and the sire of the right type of Poland Chinas.
Junior Herd Boar—THE SEQUOIAN, by Blue Valley Big Bone, a young sire of remarkable possibilities.

Z. M. DICKEY, DINUBA, CAL.

King's Big Bone Leader

has amplified our greatest expectation as a sire of big type Poland Chinas.
GIANT BOB 2nd is a young boar of great possibilities.
We feel confident they represent the type most desired.

Les McCracken Ripon, Cal.

You Can Buy Choice Pigs Now

from my herd of big type Poland Chinas I can offer some exceptional buys. Bred sows and gilts or pigs. First that write me will get some choice animals. Priced very reasonable. Write me at once for full description.

Exceptional Herd Boar For Sale.

Eugene Miner Lodi, Cal.

THIS IS WHAT COUNTS

If you are raising hogs the quicker you can make 200 pounds of pork the more money you make. I breed Poland Chinas that mature quick.

BIG MODEL FELLOW—my herd boar was Reserve Grand Champion at last state fair. Buy a sow bred to this boar and secure both quick maturing and show qualities.

J. F. McSwain Merced, Cal.

The Practical Test

of any breeder is satisfied customers. Recent sales to old customers indicate to me that my practical herd of big type Poland China sows headed by Forrestview Bob, a son of Caldwell's Big Bob, are producing the kind that satisfy. I will be pleased to satisfy you. Write me.

J. H. Cook Paradise, Cal.

Aviator A Poland China boar that is proving one of California's greatest sires. His pigs show that excellency of type and quality so much desired and are finding a ready market. Write for yours.

CROSS BROS. MERCED, CAL.

Is a Calf Worth 23 Cents?

For 23 cents you can insure your calves against death from Blackleg by having them vaccinated with PURITY BLACKLEG AGGRESSIN. (The Kansas Germ Free Blackleg Vaccine.) One treatment immunizes for life and there is no danger in introducing Blackleg into healthy herds of cattle. We also manufacture and sell PURITY ANTI-HOG CHOLERA SERUM, PURITY MIXED VACCINE for swine, and PURITY HEMORRAGHIC SEPTICEMIA VACCINES for cattle and sheep. Stop your losses and increase your profits—it's good business. For service that counts, and does not end by selling, write, wire or phone

POULTRY

OUR SPECIALTY
GUARANTEED TRAP NESTED
S. C. WHITE LEGHORNS

We have 128 females with records from 200 to 296 eggs during 12 months pullet year. Place your egg order now. All orders booked and filled in rotation. We have three grades, as follows, from which only one setting per week will be sold: 235 to 284 egg record $15.00 per 15; 220 to 235 egg record $10.00 per 15; 200 to 220 egg record $5.00 per 15. We guarantee 90 per cent fertility and suggest they be hatched by hens. Each egg will be marked with number of hen and number of eggs laid during pullet year. All these hens are mated to cockerels, sons of hens with records from 278 to 296 eggs. Baby chicks all sold. ENGLAND'S EGG RANCH, the home of "ACTUALLY" trap nested S. C. White Leghorns every day in the year since 1912. Box B-337, Inglewood, California.

S. C. White Leghorn Breeding Cockerels—I am now taking orders for young breeding cockerels to be delivered at age of three months and upward. This is the same class of stock that I have entered in the Santa Cruz Egg Laying Contest, and which at present is leading over all others. Also, a few dozen, each week, of extra choice hatching eggs from specially selected two year old hens, mated with vigorous 10 months old cockerels from high laying strain. D. B. Walls, Rural Route 4, Box 88-A, Petaluma, California.

Your Opportunity—Next two weeks. R. I. Reds, Black Minorcas, Barred and White Rocks, 18 cents each. White and Brown Leghorns, select stock, 16 cents. Utility White Leghorns 13 cents, 500 or more at less. Send at once your order for any of above. Our quality stock, plus "know how" hatching, careful shipping, means safe arrival of good chicks, at reasonable prices. Express or Parcel Post. Try us. Mission Hatchery, Box 27, Campbell, California.

S. C. White Leghorn Hatching Eggs and Chicks. All stock from our own pens of selected high egg producing two year old hens, mated to cockerels having the same blood lines as our 1919-20 prize winners. 500 chix ready March 23. Prices on application. Stock and eggs limited. ALLES-SAN-DRO POULTRY YARDS, 523-D Rosemont Ave., Los Angeles, California. Tel. 53511.

For Sale—Hatching Eggs, Day Old chicks, from Kopps' famous Anconas, the heavy winter layers; they have the vitality and the laying habit and are bred to lay eggs; $3 per 15; $12 per 100. Day old Ancona chicks from my own stock, $20 per 100. S. C. White Leghorn eggs, $2.50 per 100. George Kopp, P. O. Box 819, Los Angeles, California.

For Sale—R. I. Red, Brown and White Leghorn, Baby Chicks and hatching eggs, from our own Hoganized selected stock. Chicks $15.00 and $20.00 per 100. Eggs $7.00 and $8.00 per 100. Single settings $1.50 and $2.00. Order early. W. J. Rennie, Buena Park, California, R. No. 1, Box 79-C.

Sly's Single Comb Rhode Island Reds prove their quality by winning at Los Angeles, 2 firsts, 4 seconds, 2 thirds, 2 fourths, 2 fifths, 2 shape specials, 2 color specials, 1 gold special, 3 silver cups. A top notch exhibition and utility strain. Send for Catalogue. A. G. Sly, 1642 E. Middleton Place, Los Angeles.

Day Old Baby Chicks—From mature hen eggs—February—White Leghorns $17.00 per 100; Black Minorcas, Barred Rocks, Rhode Island Reds $22.00 per 100—March $2.00 per 100 less. Terms. One-third cash with order. T. C. Hawley, 504 East Elm Street, Lodi, California.

For Sale—Baby chicks every week. Barred Rocks, Rhode Island Reds, Buff Orpingtons, Black Minorcas, Anconas, Brown and White Leghorn Hoganized. Safe arrival guaranteed. Tobener Poultry Ranch, Route 2, 306. San Jose, California.

I Won More First and special prizes on S. C. R. I. Reds at the recent Oakland Show than all other exhibitors combined, 188 Reds competing. Hatching eggs from prize birds for sale. F. M. Lail, 6 Lupton Ave., San Jose, California.

For Sale—Thoroughbred White Wyandotte settings, $2.50 for 15 eggs, also, choice White Wyandotte cockerels from $5.00 to $8.00 each. Apply Gordon O. Tetley, 190 Edgewood Place, Riverside, California.

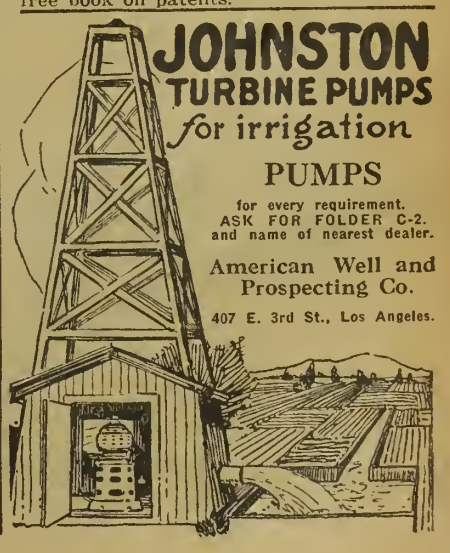
WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.



CALIFORNIA CAULIFLOWERS

All cauliflower growers are firmly of the opinion that Californians must, by cross-breeding and selection, produce their own cauliflower seed. The writer has now seen at two stations, 14 new varieties of cauliflower being tried and none are promising. Of the two lots, one is on government station grounds at Alhambra, the other on the A. C. Yingling ranch near Compton, both in Los Angeles County. Both are growing much the same, and the most promising is a branching sort,

A Yingling cauliflower trimmed for market.

with one main head and several later smaller heads, the very type the commercial grower is seeking to avoid. He wants one big compact head.

So it may truthfully be said that no outside or foreign varieties have thus far proved as good as the sorts raised here, the original seed of which came from Italy about 1890. We have not had a single name that did or could include all the types, of which there are many. Selection has been going on for many years and it is felt that local stock is now up to a high standard. Mr. Yingling has for years saved his own seed by careful selection until he has a reputation among both growers and shippers of producing none but the best. He is a grower for shipping, not a seed grower. Yet a noted seed expert visited him lately, looked over his crop, and told him if he would let that crop go to seed he would give him $20 a pound for 50 pounds of it and—the crop is now in blossom.

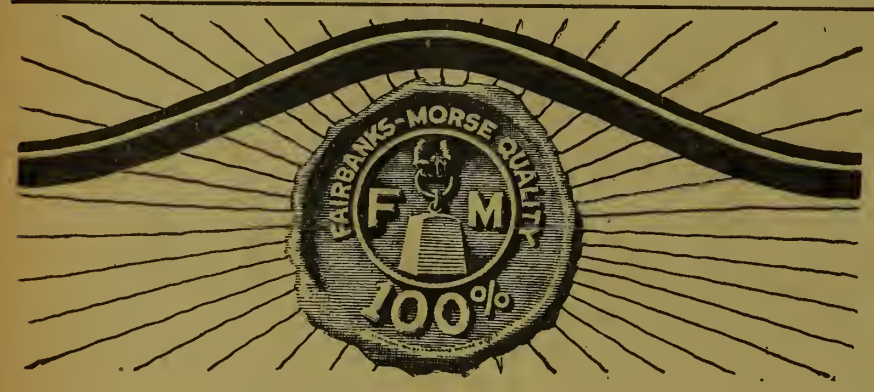
Mr. Yingling's cauliflower seed is used by his neighbors and other growers at other points; also by seedsmen so far as they can get it, for he is not a seed grower and others grow his variety for seed purposes. This variety is short stemmed, perfectly adapted to our mild climate, does not get soft, and the flower is protected from rain, sun and frost by a dense crop of infolding leaves that are likewise a protection in shipping. It is decidedly a laster and is therefore a favorite with all, home grower, gardener, dealer and shipper. What Mr. Yingling has done every large grower may and should do. Grow your own seed and by selection of ideal plants, allowed to go to seed instead of being cut, you will bring your product up to the highest possible standard.—E. B.

A Perfect Envelopment

Leaves cut away to show how foliage protects from rain, sunshine, frost, or injury in transit.

NEIGHBORLINESS REVIVED

American rural and village life is experiencing a new era of neighborliness. It began a score of years ago but received its greatest impetus during and since the war. Well housed rural clubs, something almost unheard of a few years ago, are springing up all over the country. Because they mean so much to their neighborhoods, and because this neighborhood movement contains so much of promise for the 50 million Americans who live in the country or in villages of less than 2,500, the United States department of agriculture has sent representatives to learn first hand the history of nearly 300 of these club houses. The results of this investigation have been recently published in a bulletin, "Rural Community Buildings in the United States," which can be had by addressing a request to the United States Department of Agriculture, Washington, D. C.



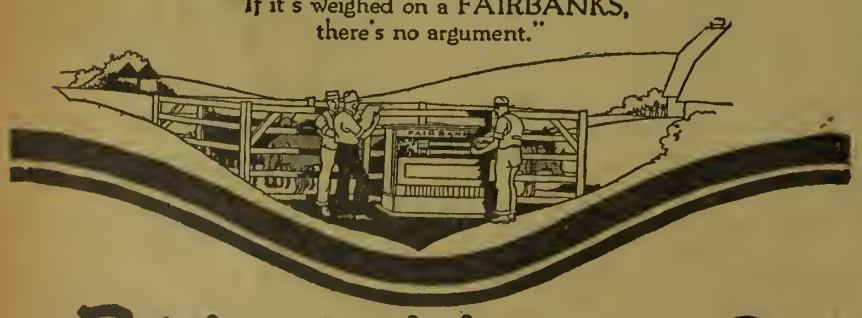
A hundred times a week

THAT'S how often you are likely to be misled by a poor scale. A FAIRBANKS Scale means absolutely accurate weight—saves dollars—pays for itself.

¶ Chickens, cattle, hay, corn, milk—everything you raise should pass over a dependable scale with the built-in quality that insures accuracy. Otherwise you are allowing dollars to slip through your fingers at every weighing.

¶ Modern, efficient farming demands the elimination of guess-work. KNOW your weights. Use a FAIRBANKS Scale.

"If it's weighed on a FAIRBANKS, there's no argument."



Fairbanks, Morse & Co.
CHICAGO

ANNOUNCING

as our Pacific Coast distributors

Fairbanks Morse & Co.

of Los Angeles, San Francisco, Seattle, Portland, and Spokane, who will handle the sale of and repair parts for

Ross Alfalfa and Ensilage Cutters

throughout this territory.

ROSS CUTTERS dominate their field. Their many exclusive mechanical features; their strong, sturdy construction and ability to stand up under the hardest kind of service; and their clean-cut work, done with less power and labor—all have been responsible for the reputation for superiority that they are nationally accorded.

Through the well-developed sales and service organization of Fairbanks, Morse & Co., we are now better able to carry on our work of supplying Ross Machines to the farmers of the Pacific Coast.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Registration of Minor

A minor will be of age 30 days prior to election. Can such minor register at any time prior to actually becoming of age or must the registration be deferred until he reaches his majority? —Subscriber, Los Angeles.

The qualification of registration as contained in the political code requires that the affiant making the affidavit of registration must be at least 21 years of age at the time of the next succeeding election, therefore he could undoubtelly register prior to the election so as to be entitled to vote upon the election.

Selling Irrigation Water

I own a ranch with a pumping plant. My neighbor has adjoining acreage with no water. Can I furnish him with water for irrigation without being subject to paying a state tax or making an annual report to the railroad commission? I am told that my neighbor would become a part owner of my plant if I furnished him with water for five years. Is this true? — Subscriber, Chino.

The public utility act provides that every person owning, controlling or operating any water system for compensation within this state where the service is performed for or the commodity delivered to the public generally or to any limited portion of the public, including a person, private corporation or otherwise, wherein payment whatsoever was received is a public utility subject to the jurisdiction, control and regulation of the commission. Such public utilities are required to make very extensive reports to the railroad commission, and the rates which they charge are subject to regulation by the state railroad commission. The tax spoken of is probably that which is assessed upon operating corporations by the state and would hardly apply in this case. If the water was furnished under a written agreement your neighbor could not claim any right by prescription to the use of this water. In order to constitute such a right he would be obliged to set up that he is the owner of such right. A contract which you would make with him would furnish conclusive proof that the water was not furnished under any claim of ownership.

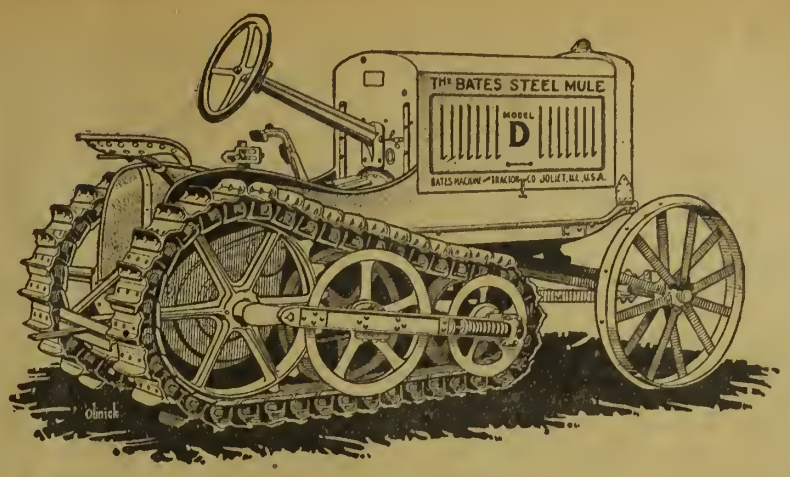
IMPOSSIBLE BY ARITHMETIC

(Continued From Cover Page)

membership is almost exclusively of commercial producers, that is, people who make egg production their sole business. Unless one has at least 500 laying hens he is not eligible. The Southern California association handles nearly a million and a half dollars worth of eggs annually, and at present rate of increase will double that within a few years.

There seems to be no way of stabilizing the market from the standpoint of the backyard producer and the great mass of the eggs of the United States is produced by them. For instance, in the Middle West where millions of cases of eggs are produced daily the commercial poultryman is an unknown quantity; practically every egg is a side line production. Near the larger Eastern centers there are a few commercial producers, but an idea of the magnitude of the backyard industry is shown by the fact that within the city limits of Chicago there are 3,000,000 hens, or three-fourths as many as there are in nearly all Southern California.

As big as the problem is, it is up to the commercial producer to stabilize the market, and the fact that he has stabilized the market, and to an extent, at least, solved the problem given in the first sentence of this article is the reason why he will continue to cooperate and encourage the world's greatest little food producer.



A Better Seed Bed

GREATER grain yield on your farm calls for greater efforts at the source—the seed bed. And it is with the Bates Steel Mule that you will solve your greater production problems.

Bates Steel Mule Crawler type of traction goes into the field and outworks all other tractors and makes playtime of Spring Work. It does not slip on soft ground and therefore allows double discing and harrowing in one quick operation—assuring a finer seed bed.

The broad Crawler surface makes ground pack impossible.

Don't let Spring Work get the jump on you. Buy your Bates Steel Mule now and be prepared.

If your dealer has not yet received his Bates Steel Mule shipment, write direct for full information and new catalog.

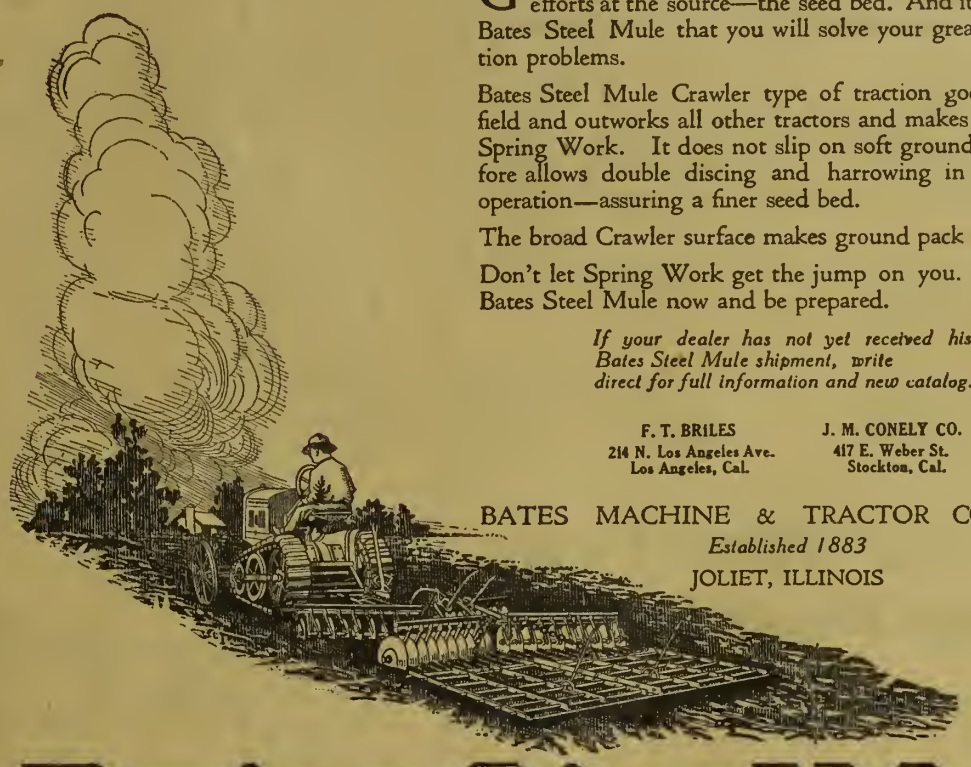
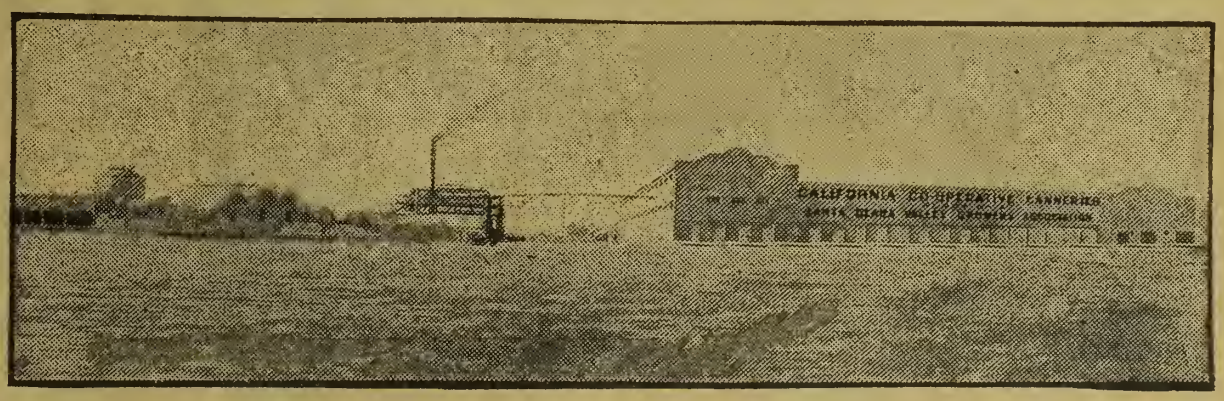
BATES MACHINE & TRACTOR COMPANY
Established 1883
JOLIET, ILLINOIS



The New **Bates Steel Mule**

The most efficient Tractor in America



Cling Peaches $137.00

That is what some growers received who delivered their fruit to this big company which they own themselves.

The average price for all grades Number 1's, Number 2's and culls, was $117.00.

These growers expect even better prices for the season of 1920.
